| Industrial | In Richmond, areas designated for industrial land use are concentrated along the north shore of the Fraser River South Arm, the north shore of Richmond, and on Sea Island Way. In Delta and Surrey, these areas are concentrated along the south shore of the Fraser River South Arm from Tilbury Island east to the boundary with Langley Township, as well as at Roberts Bank. In Surrey, lands surrounding portions of the CN rail line that bisects Surrey are designated industrial. |
| Mixed Employment | Includes portions of northern Richmond between Highway 99 and Knight Street, an area of Richmond north of Kirkland Island and Barber Island, an area on the south east border of Surrey, an area in Surrey between the South Fraser Perimeter Road and King George Boulevard, and in Delta adjacent to the Highway 99 corridor near the Boundary Bay Airport. |

Richmond Official Community Plan

Richmond’s OCP (2012) land use designations are shown in **Figure 5.3-6** those that occur within the land use subcomponent LAA are described in **Table 5.3-5**.

Table 5.3-5 Richmond Official Community Plan designations within the land use subcomponent LAA

| Land Use Designation | Description |
|--------------------------------|--|
| Agriculture | Includes the majority of land adjacent to the Project alignment from Westminster Highway to the Tunnel. |
| Apartment Residential | Includes a small area that occurs in the northern portion of the LAA, east of Shell Road, northeast of the Project alignment. |
| Commercial | Includes retail and other services. Within the LAA, commercial lands are located east of the Westminster Highway interchange, at the edge of the LAA. Additional commercial areas are located to the west of the Steveston Highway interchange and east of the Project alignment south of Bridgeport Road. |
| Community Institutional | This designation includes schools and religious institutions and is primarily situated to the west of the Project alignment, along No. 5 Road, between Blundell Road and Steveston Highway. |
| Conservation Area | Includes Richmond Nature Park, areas of land on either side of Highway 99. The Fraser River South Arm islands are to the west of the LAA. |
| Industrial | Includes a broad range of general and heavy industrial as well as other compatible uses. Within the LAA, industrial land is primarily located on the north shore of the Fraser River South Arm, with some areas in the northern section of Richmond, along the Fraser River North Arm. |
| Limited Mixed Use | Includes lands where a small range or mix of uses is permitted. Within the LAA, limited mixed-use land is designated at the northwest corner of the Steveston Highway/Highway 99 interchange. |
| Mixed Employment | Includes residential, commercial, and some light industrial land uses. Mixed employment lands that overlap the LAA are located near the Steveston Highway interchange, and between Alderbridge Way and Bridgeport Road. |

| Land Use Designation | Description |
|-------------------------------------|---|
| Mixed Use | Includes commercial buildings having housing located above, inclusive of residential and non-residential uses. There is an area partially within the LAA, located south of Bridgeport Road and west of the Project alignment. |
| Neighbourhood Residential | Includes areas adjacent, or within close proximity, east and west of the Project alignment and north of Bridgeport Road to Highway 91 as well as a proposed neighbourhood along No. 5 Road west of the Steveston Highway interchange. |
| Neighbourhood Service Centre | Includes mixed-use hubs such as shopping centres and gas stations and within the LAA, west of the Steveston Highway interchange. |
| Park | This designation is intended for outdoor land, specifically for passive or active recreation including open space, par-3 golf courses, playgrounds, environmentally sensitive areas, conservation areas, and sports fields. Within the LAA, they include the Kilby Park and an area to the southeast of the Bridgeport Road and Highway 99 interchange. |
| School | Includes existing schools: the Talmey Neighbourhood School, located between Bridgeport and Cambie Roads, on the west side of Highway 99 and a portion of the Tomsett Elementary School are located in the LAA. |

Delta Official Community Plan

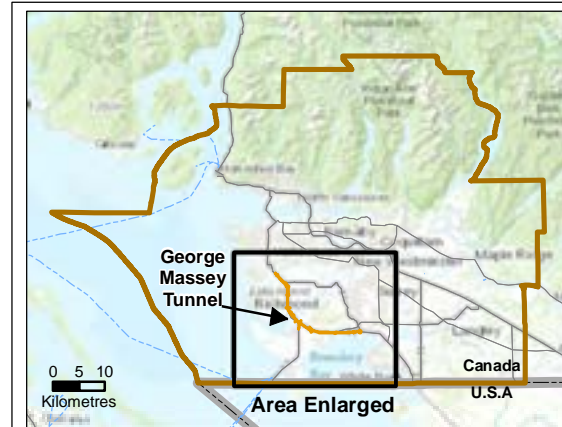

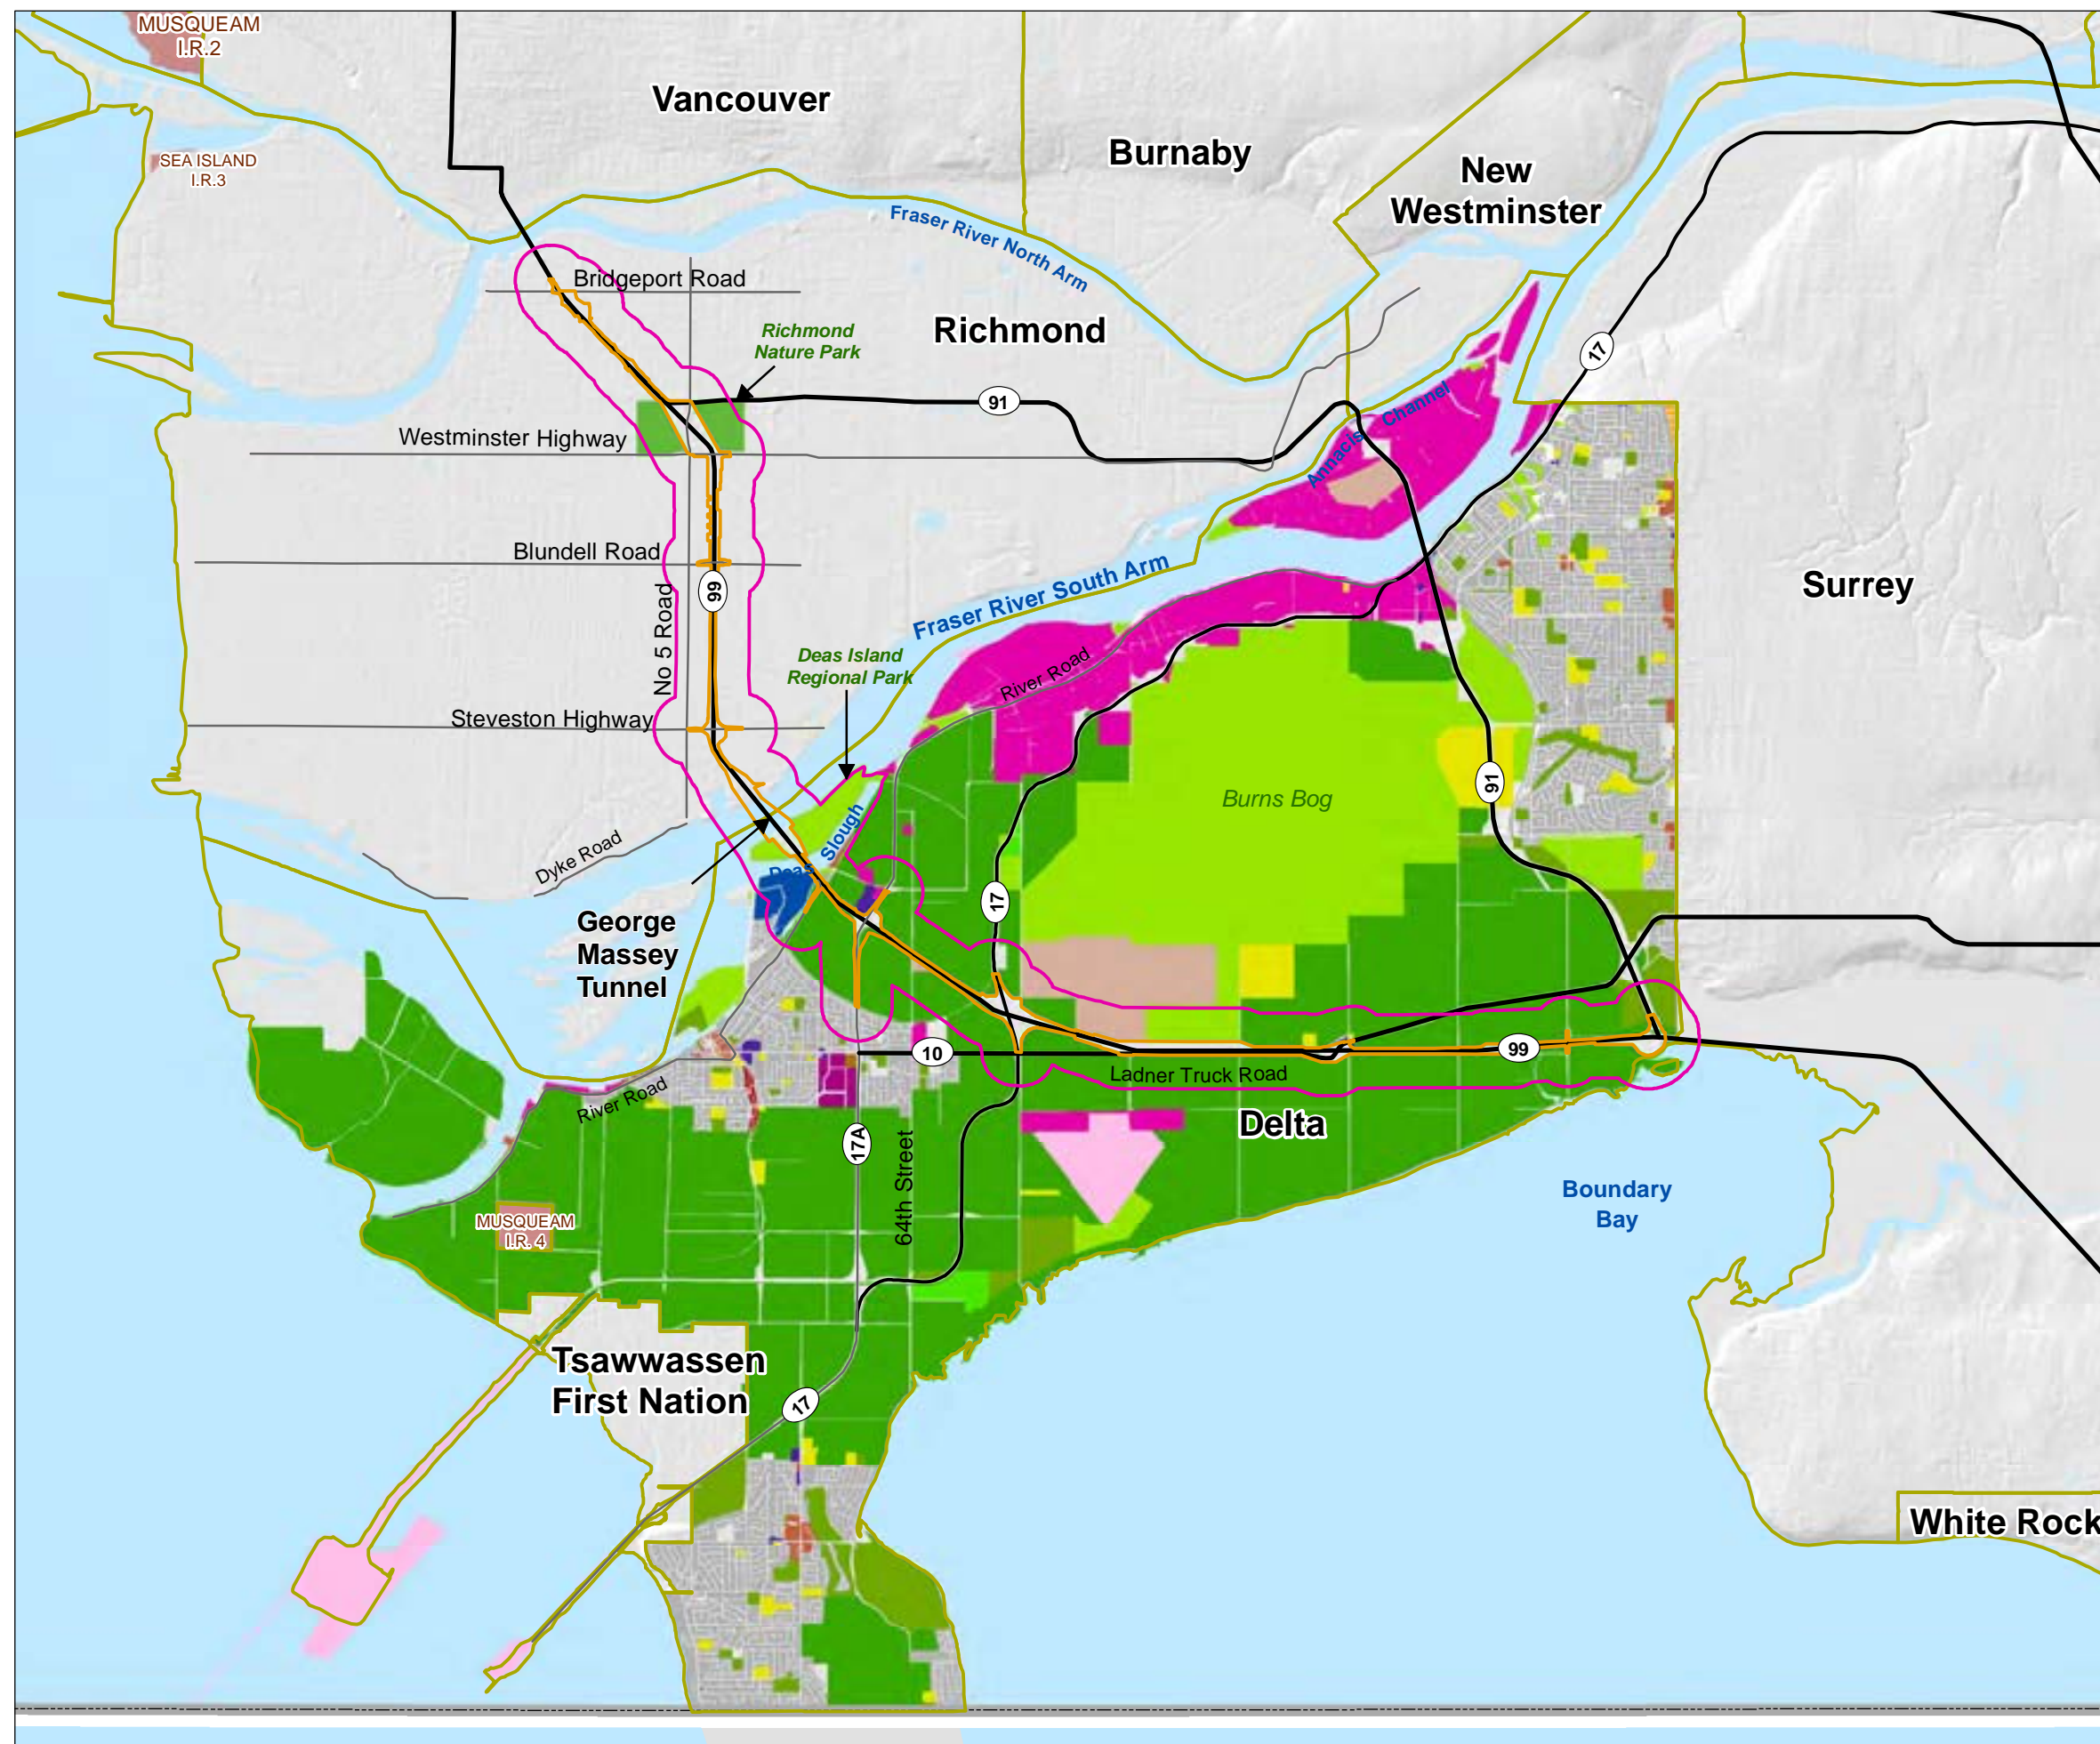

Delta’s OCP (2014) land use designations are shown in **Figure 5.3-7** and those that occur within the land use subcomponent LAA are described in **Table 5.3-6**.

Table 5.3-6 Delta Official Community Plan designations occurring within the land use subcomponent local assessment area

| Land Use Designation | Description |
|---------------------------------------|--|
| Agriculture | Intended for both general and intensive land use, this designation also includes ALR lands. The majority of land within the Delta portion of the LAA is classified as agriculture. |
| Commercial | Includes general commercial, service commercial, and neighbourhood commercial developments. Limited residential uses, such as dwelling units above a commercial use, are permitted. Within the LAA, commercial designations are located at the northwest corner of Highway 99 and Highway 17A interchange, and north of the Highway 99 and Highway 10 interchange. |
| Environmentally Sensitive Area | Deas Island Regional Park and portions of Burns Bog Conservation Area and Green Slough overlap the LAA. With conservation as a primary objective, principal uses include preserving, enhancing, and managing vegetation, wildlife, and habitats with the aim to maintain natural conditions, features and ecological functions as much as possible. |
| Industrial | Includes light, heavy, and water-related industrial uses. Where industrial lands are included within the ALRs, agricultural uses are also permitted. Within the LAA, there are areas located north east of the Hwy 17A interchange. Areas outside of the LAA are located along River Road East (adjacent to Fraser River), Tilbury Island, Annacis Island, and Roberts Bank. |
| Institutional | Includes schools (primary and secondary) and other civic uses (e.g. churches and other religious institutions). Within the LAA, these include Delta View Life Enrichment Centre retirement home, located northeast of the Ladner Truck Road and Highway 99 interchange. |
| Major Park and Recreation Area | Includes regional, municipal and public open spaces as well as recreation and conservation areas. Specialized commercial uses may be permitted to serve the users of these areas. Several parks are partially within the LAA including the Watershed Park along Highway 91, between Ladner Truck Road and Highway 99. |

| Land Use Designation | Description |
|------------------------------|---|
| Marina Garden Estates | Intended for a mix of uses including retail and office commercial, multiple-family residential, recreation, cultural, public, and open space. Within the LAA, future Marina Garden Estate development will be located on the southwest side of the Deas Slough (part of the Marina Garden Estates Development), immediately west of the Project alignment. The Millennium Trail connects to the development to the Deas Slough crossing. |
| Public Utility | Intended for electrical stations, wastewater treatment plants, public landfills, public works yards, or other public utility uses and includes the Vancouver Landfill (located north of Highway 99 and east of Highway 17). A portion of the Vancouver Landfill is located within the LAA, immediately adjacent to the Project alignment. This designation also includes Delta's Public Works facility and yard, located southwest of Highway 99 and 64 th Street, within the LAA. |
| Residential | Includes low, medium, and high-density residential areas. Within the RAA, these are mainly concentrated in the town centres of Ladner, Tsawwassen, and North Delta. Ladner is partially within the LAA. There is also an area of medium density residential east of the alignment (Riverwoods) |
| Riverside Mixed Use | Includes mix uses such as retail and office commercial, multiple-family residential, recreation, cultural, public, and open space. Portions of the future Riverside Development, paralleling the Deas Slough to the east of Highway 99, overlap the LAA. |
| Water | Water designations include the Fraser River and Deas Slough. |

Surrey Official Community Plan

The eastern end of the land use subcomponent LAA overlaps a small portion of lands designated as Agricultural Land within the Surrey Official Community Plan (2013) as shown in **Figure 5.3-8**. According to this OCP, the agricultural designation is intended to support agriculture, complementary land uses, and public facilities.

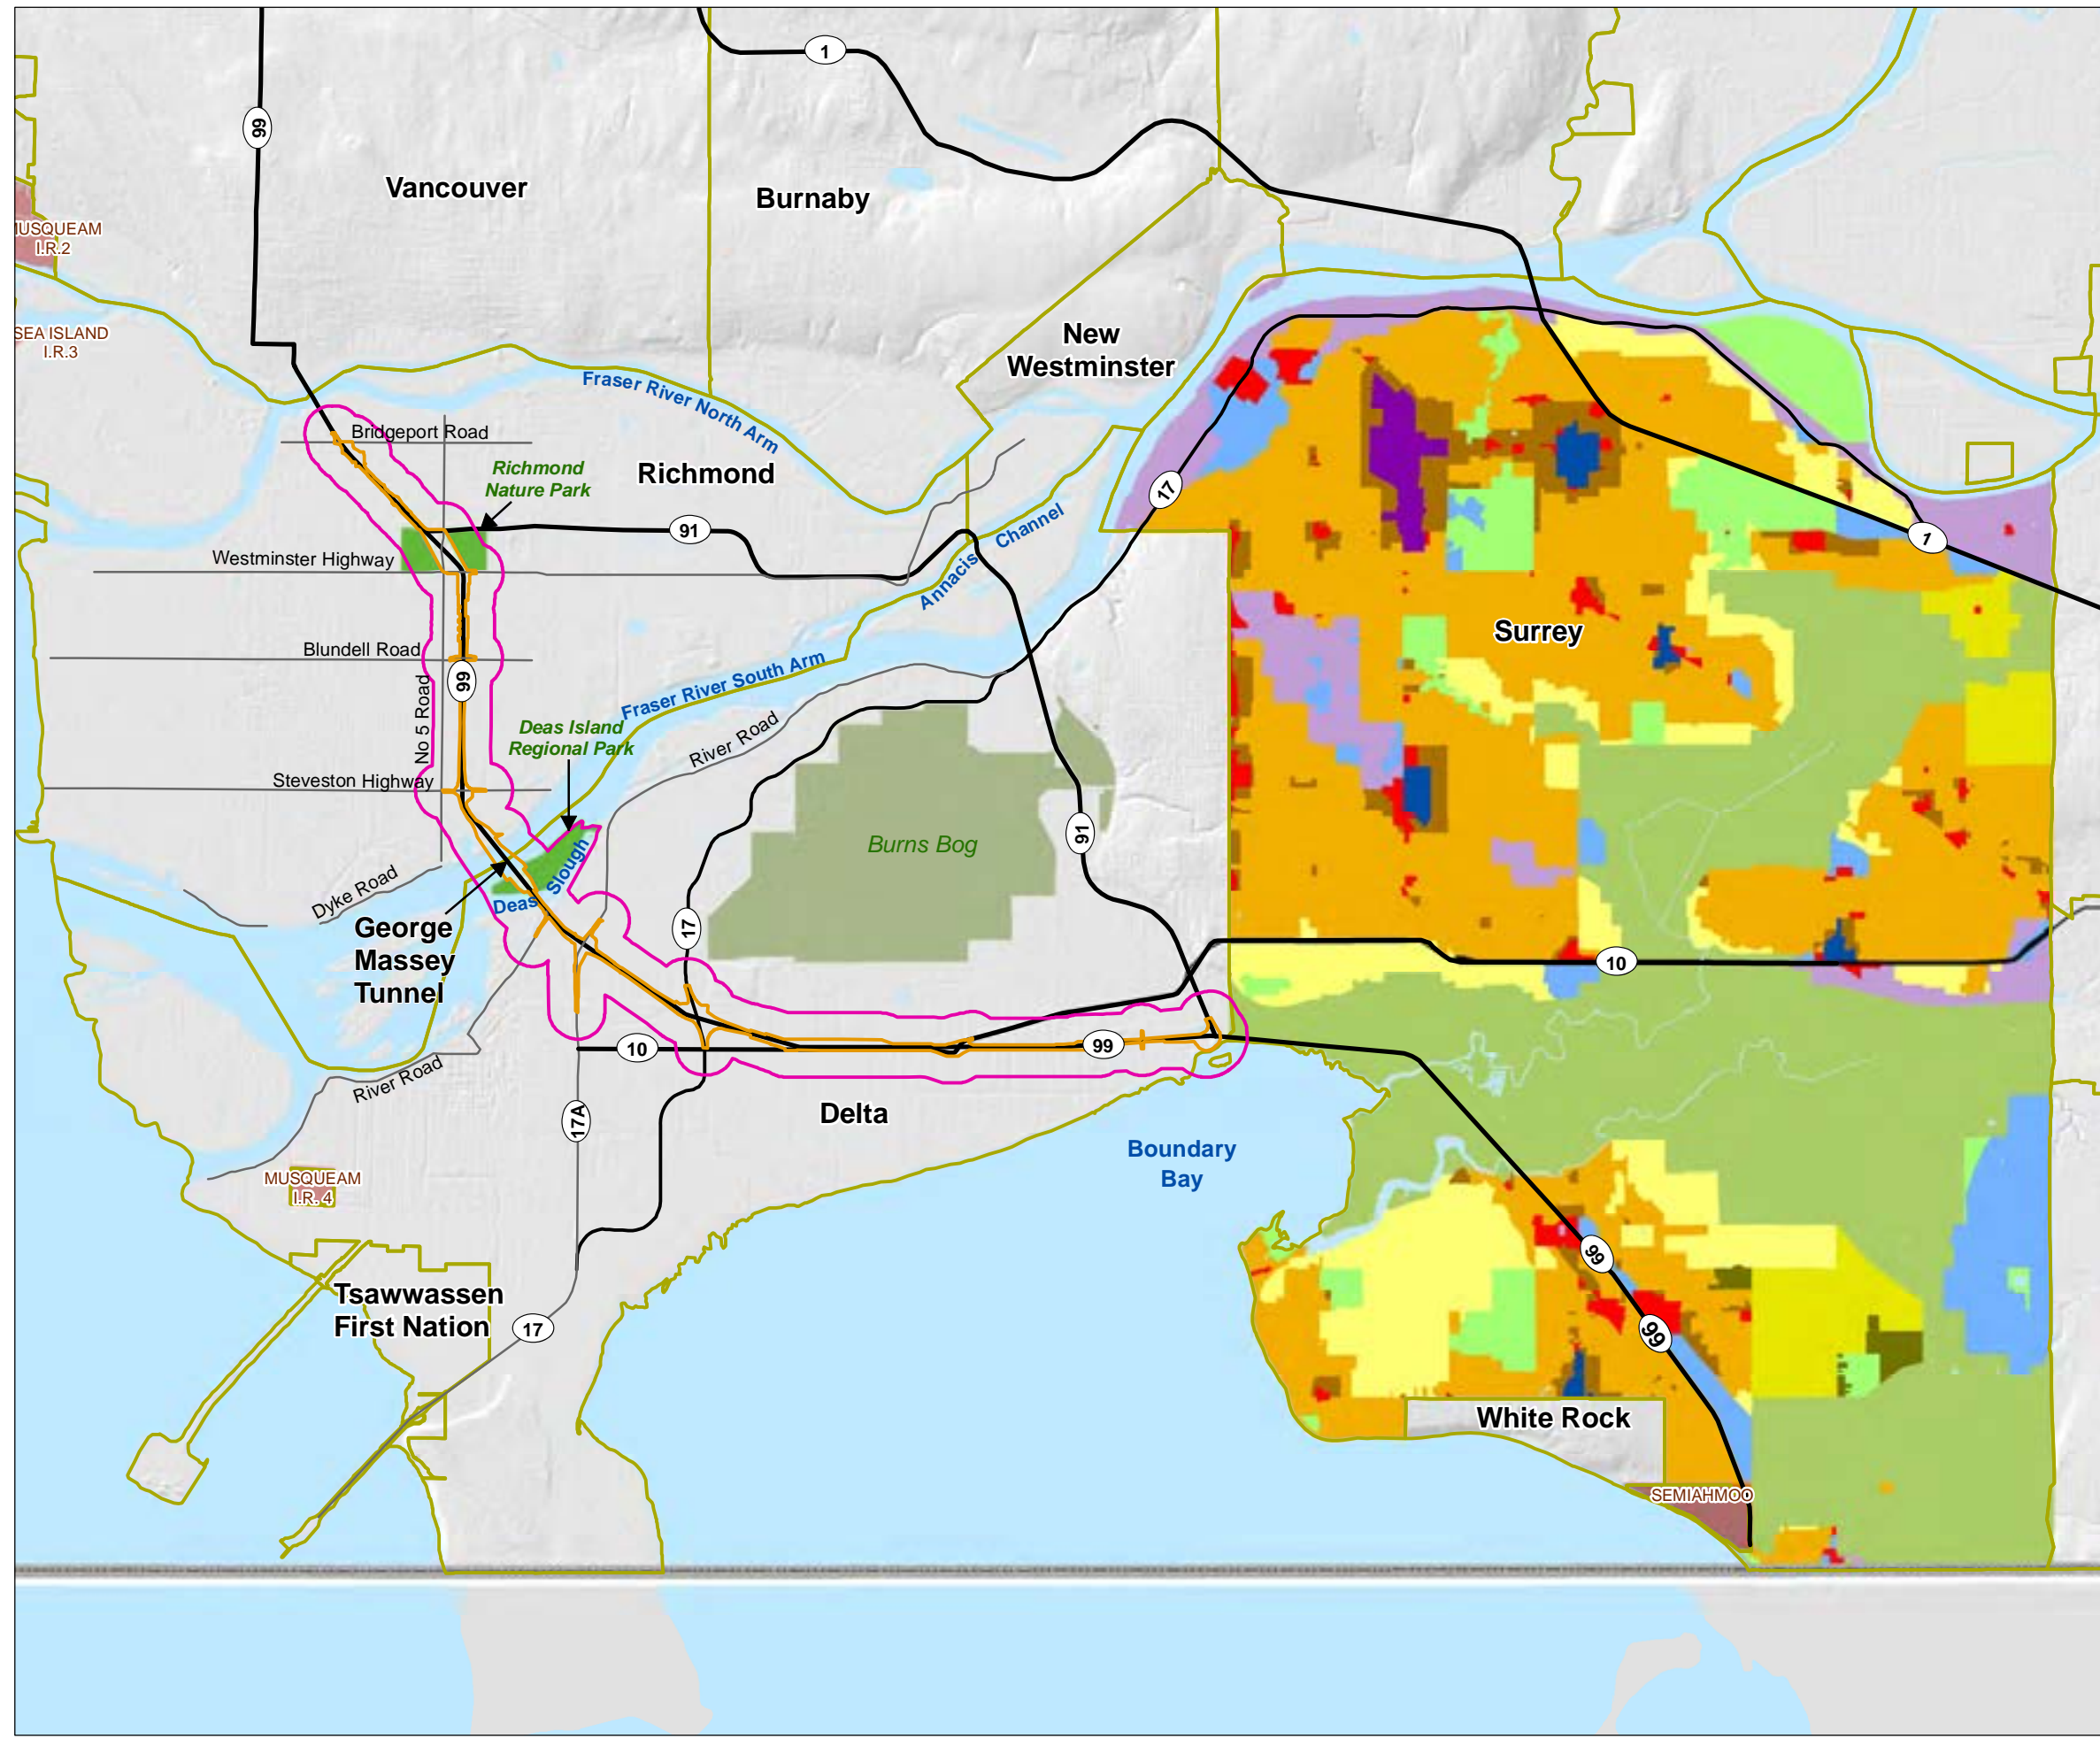

Other Planning Considerations

Local governments also prepare plans for specific land use, such as recreation or industrial development, to provide policy and guidance in addition to those outlined in OCPs or Metro Vancouver's RGS (2015).

Other relevant planning documents include:

- Richmond *Parks, Recreation and Cultural Services Master Plan* (City of Richmond 2006).
- Industrial development plans (Avison Young Commercial Real Estate 2012, 2013).
- Metro Vancouver (2016) *Regional Parks Plan*.
- Mayors' Council on Regional Transportation (2015) *Regional Transportation Investments, a Vision for Metro Vancouver*.
- Various agricultural documents (discussed in **Section 5.4 Agricultural Use**).

Although zoning bylaws specify the conditions for land use, the OCP designations are the primary determination of future uses. As such, zoning is not considered in this assessment.

GEORGE MASSEY TUNNEL REPLACEMENT PROJECT

CITY OF SURREY OFFICIAL COMMUNITY PLAN LAND USE DESIGNATIONS

Figure 5.3-8

13/05/2016

5.3.2.5 Land Uses

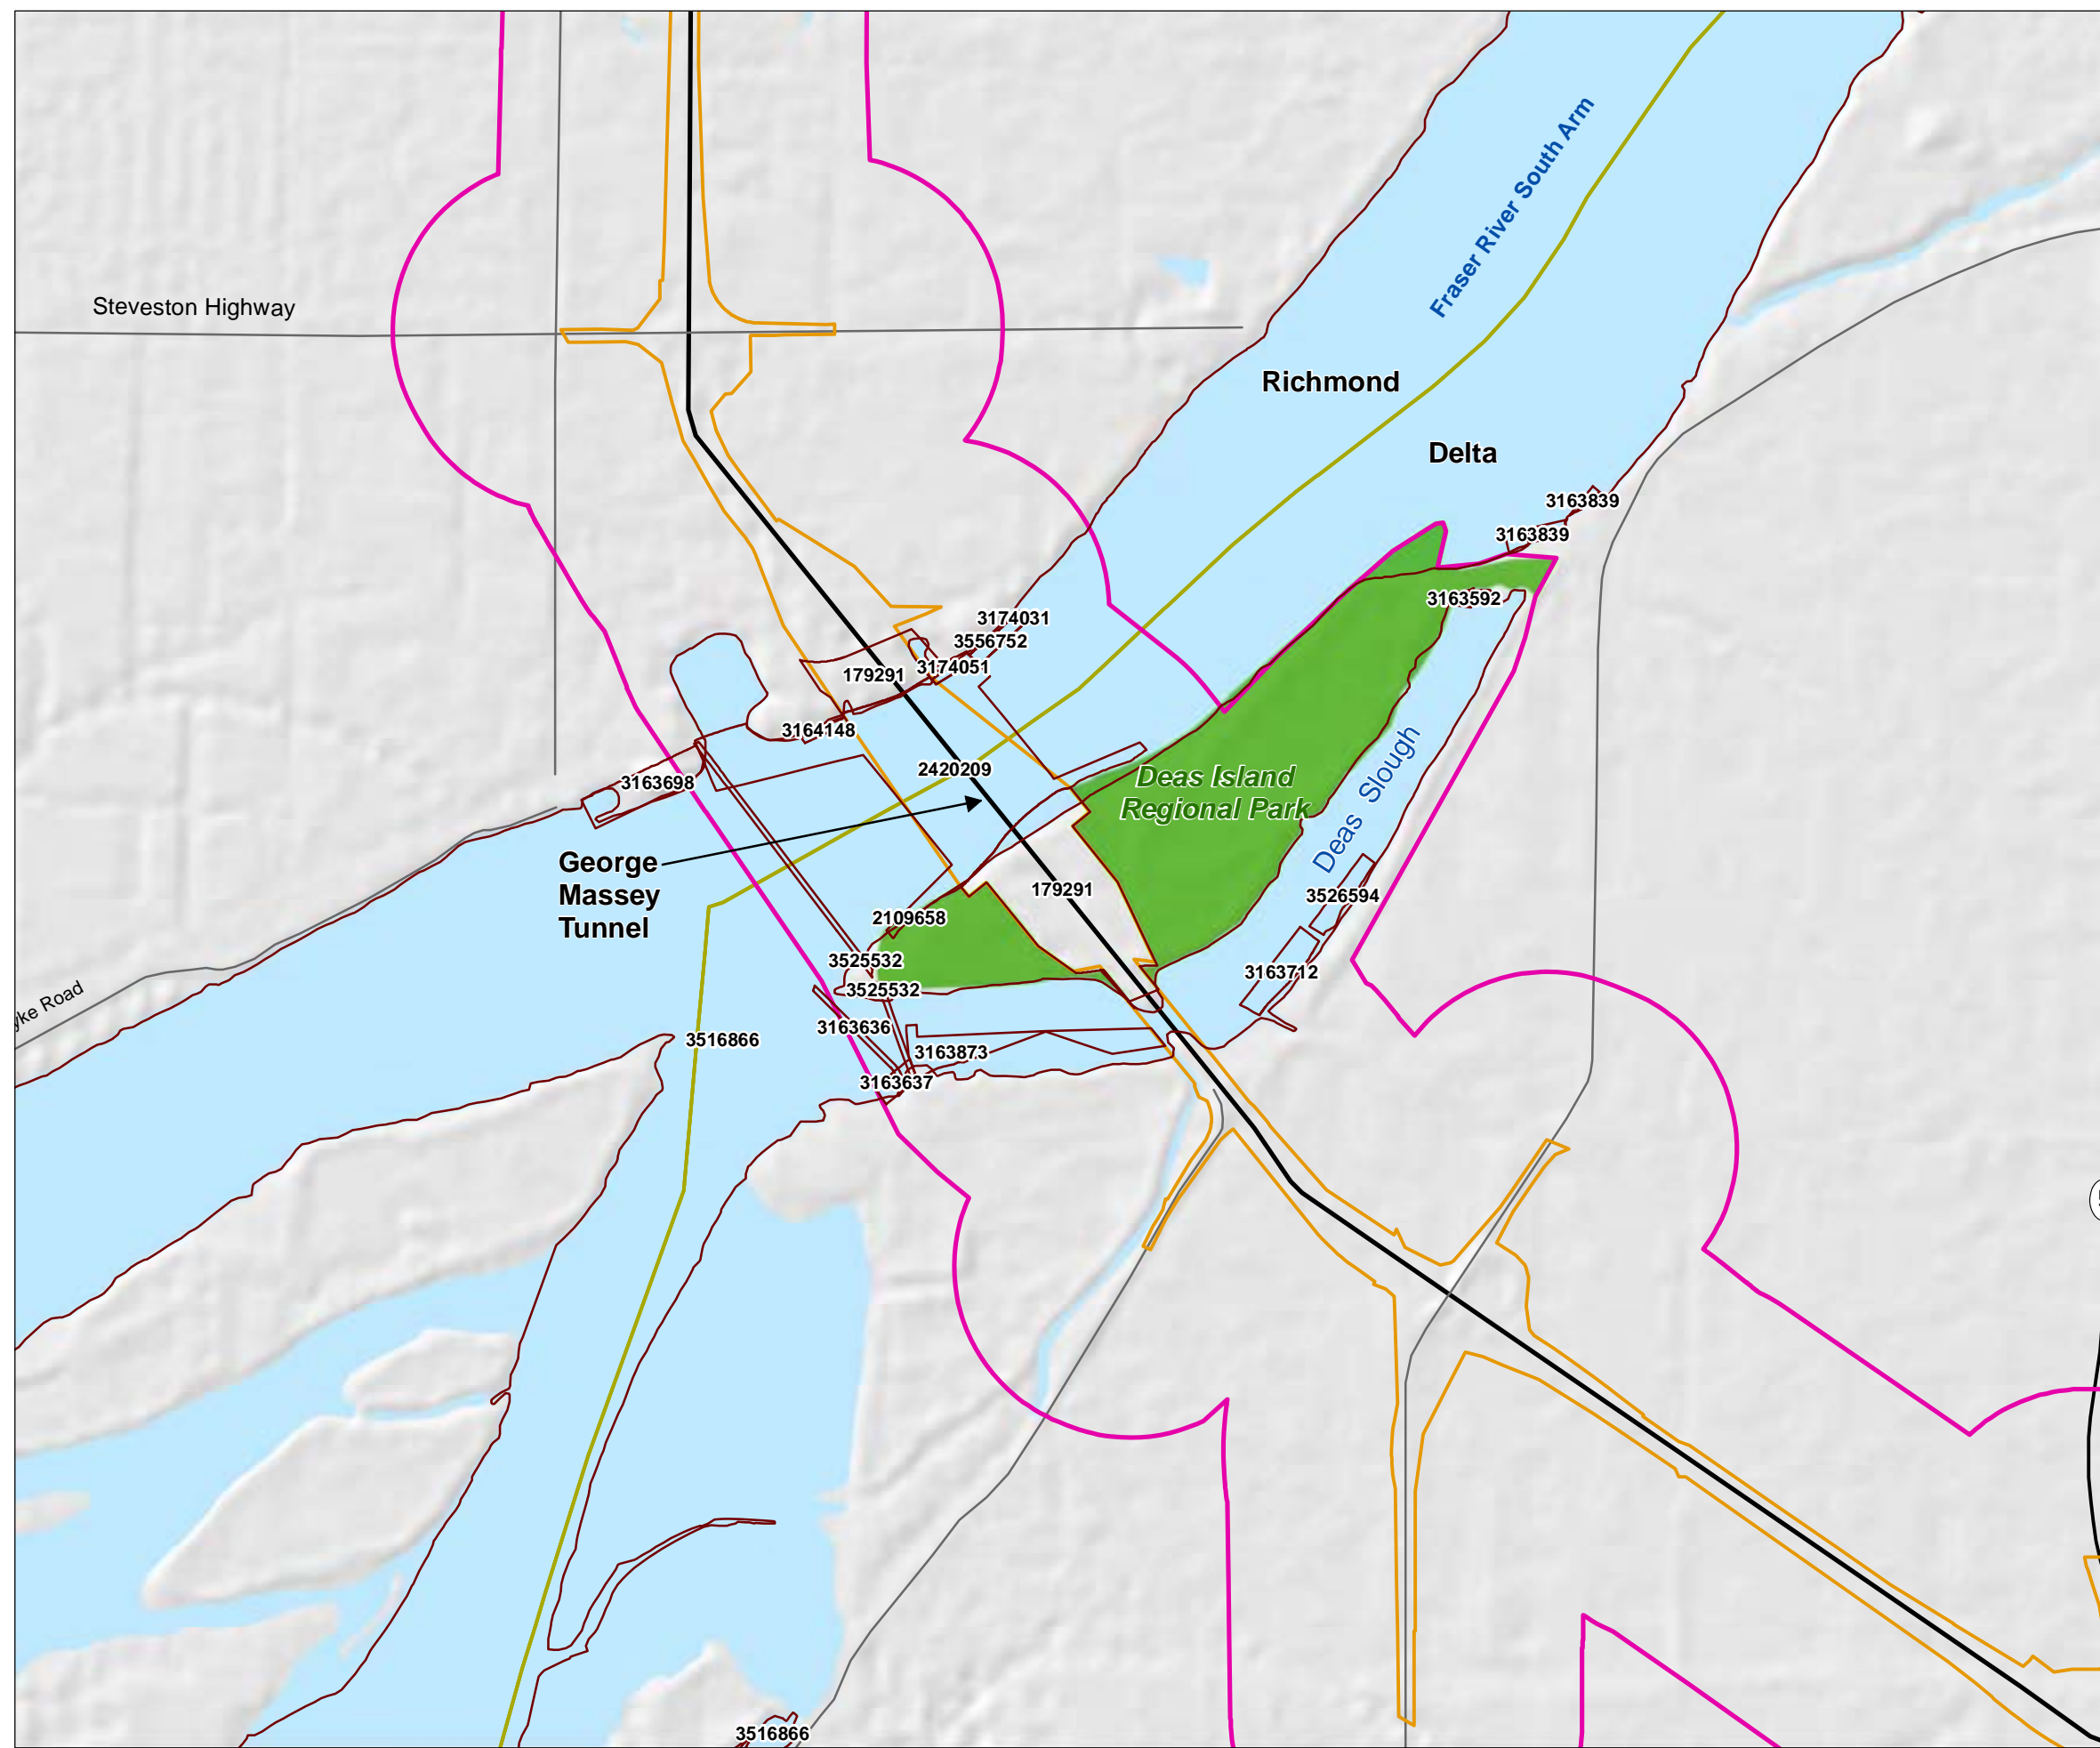

This section considers residential, commercial, industrial, park, and conservation land uses within the land use subcomponent LAA, and provides further detail on the types of use within each of these land use designations described in **Section 5.3.2.4**. Land uses within the submerged provincial Crown land in the Fraser River are also discussed.

Based on review of available aerial photographs and satellite imagery, the land uses in the land use subcomponent RAA and LAA generally conform to the land use planning designations. Navigation and other uses in the Fraser River South Arm are described in **Section 5.2 Marine Use**.

Land Uses on Provincial Crown Land

The riverbed of the Fraser River South Arm west of the eastern tip of Tilbury Island is provincial Crown land. Existing land uses are determined by the type of tenure held. The Ministry holds a transportation reserve for the area surrounding the Tunnel. Active (i.e., accepted) provincial Crown land tenures that overlap the Fraser River in the LAA are summarized as follows (**Table 5.3-1, Figure 5.3-9**):

- Fish exporter Ocean Fisheries GP has industrial licences adjacent to the north bank of the south arm of the Fraser River, northeast of the Tunnel.
- BC Hydro and Power Authority (B.C. Hydro) has a utility licence for the realignment of the electric power line in Deas Slough, west of the Highway 99 ROW.
- BC Ferries holds a reserve adjacent to the north bank of the Fraser River, adjacent south of the Tunnel transportation reserve area.
- Mainland Sand and Gravel Ltd. has an industrial licence on the north bank of the Fraser River, southwest of the Tunnel.
- The Greater Vancouver Water District has utility licences for crossings at the southwest end of Deas Island.
- Corporation of Delta has a utility licence south of Deas Island and a community licence at the north end of Ferry Road.
- Two marinas in Deas Slough, one by Captain's Cove Marina Ltd. and the other by Shato Holdings Ltd., hold commercial licences.
- Metro Vancouver holds an institutional licence at the northeast end of Deas Slough.

Notes: ILRR = Integrated Land and Resource Registry (2016)

Land Uses within Local Government Jurisdiction

Residential and Mixed Use

In Richmond, residential uses adjacent to No. 5 Road and in the northern portion of the Project include single and multi-family housing. Associated infrastructure, such as service centres and community centres (schools and religious buildings), are also present in these neighbourhoods. The northwest corner of the Steveston Highway and Highway 99 interchange is currently under residential development as The Gardens, which will be 4.86 ha including green space, garden plots, botanical gardens and trails when completed (The Gardens 2014).

In Delta, the Marina Garden Estates, situated immediately west of the Highway 99 ROW, is a division of the Captain's Cove Marina development. The existing development is of mixed housing and recreational uses (e.g., golf course, trails, boating). Future development will be a mix of multi-family housing with a commercial development along the shoreline. To the east of the Highway 99 ROW, adjacent to Deas Slough, are the Riverwoods residential development and a multi-family residential development with a pub and restaurant. Residential uses are also present on agricultural land in Richmond and Delta, as discussed in **Section 5.4**

Agriculture Use.

Commercial Uses

In Richmond, commercial uses within the LAA include several automobile dealerships located to the southeast of the Steveston Highway interchange, and various shops, hotels and other commercial uses near Bridgeport Road.

In Delta, commercial uses include a hotel, an office building situated northwest of the Highway 17A interchange, and gas stations located north of the Ladner Trunk Road interchange.

Industrial Uses

Within Richmond, industrial uses in the LAA are centred along the north shore of the Fraser River South Arm (include fish processing, manufacturing, distribution, and warehousing), and an area on the north arm of the Fraser River.

In Delta, a fish processing plant is located just outside the Land Use Subcomponent LAA northwest of the Highway 17A interchange.

Parks and Protected Areas

Multiple regional and municipal parks and protected areas occur within the Land Use Subcomponent LAA, as described below.

The Richmond Nature Park, in Richmond, is a raised peat bog habitat that covers approximately 80 ha and is designated as Conservation Area (City of Richmond 2012). A portion of Richmond Nature Park, north of Westminster Highway and adjacent to the Project alignment, is within the land use subcomponent LAA. Uses within the park include recreational walking trails, an interpretive nature centre, a picnic shelter, and a pavilion.

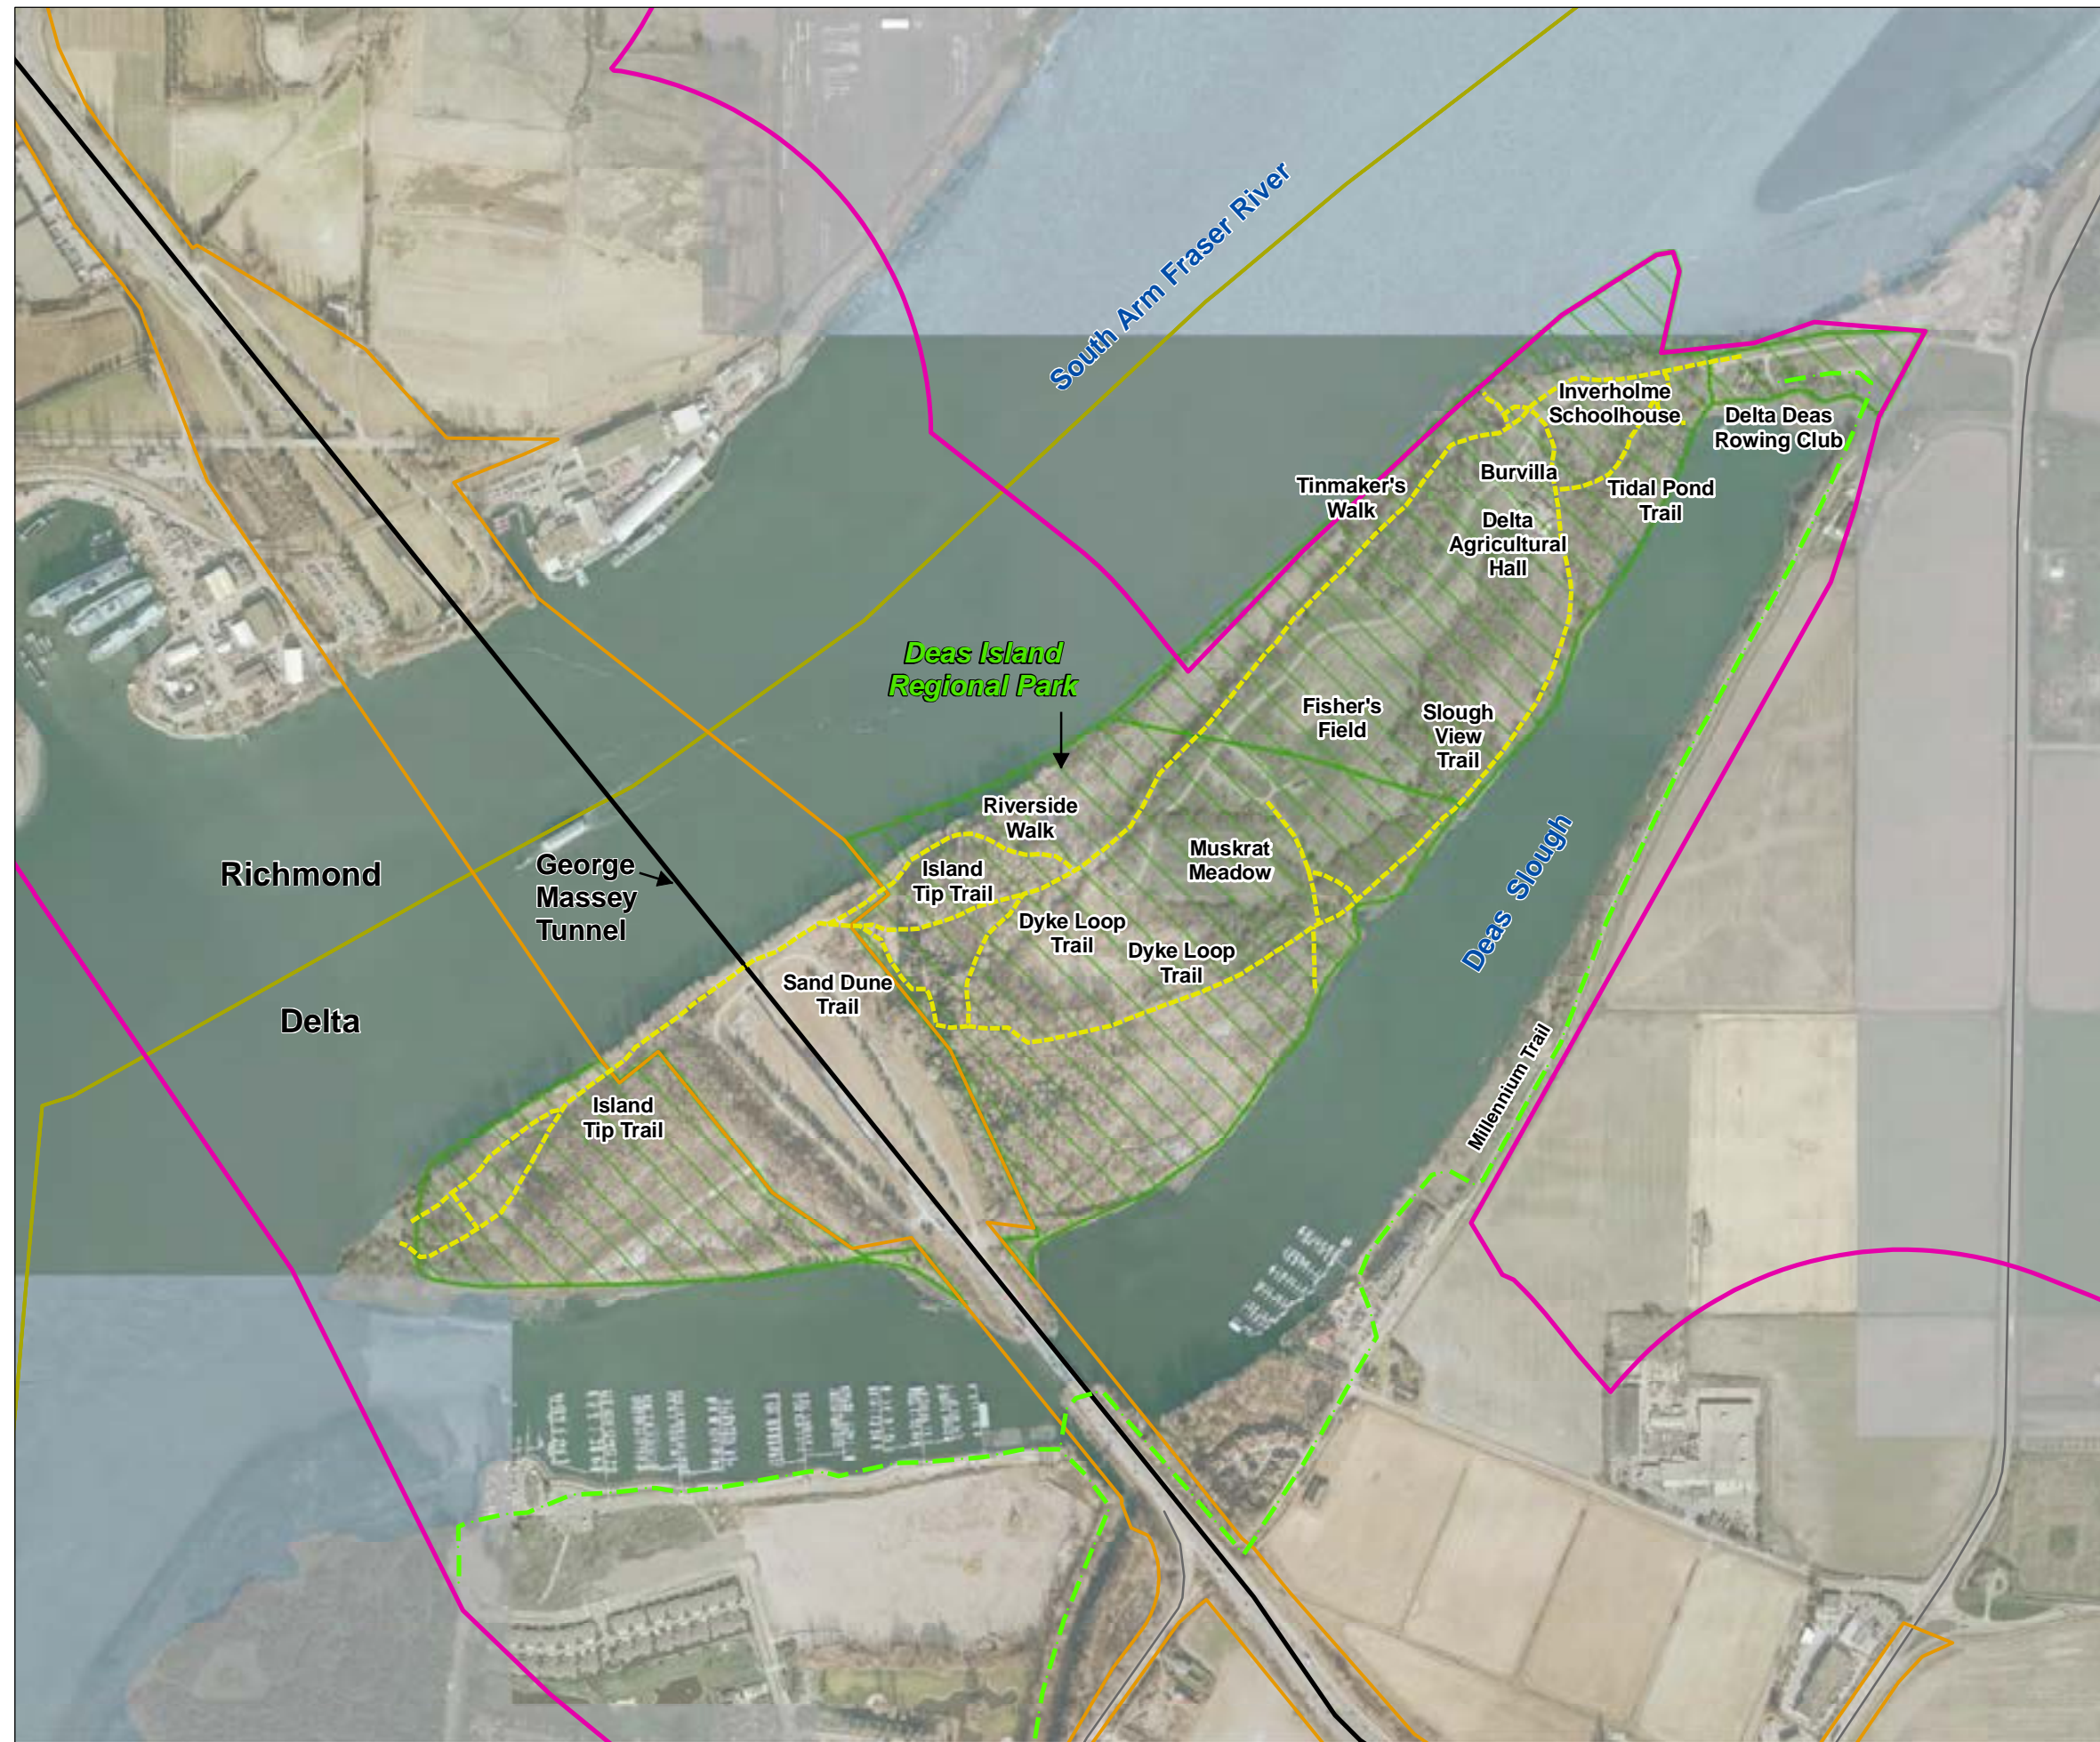

In Richmond, Talmei Neighbourhood, Tomsett Neighbourhood School, Odlin Neighbourhood, Odlinwood Neighbourhood, Kilby, Albert Airey Neighbourhood, and Model Airplane Parks occur at least partially within the land use subcomponent LAA. These parks are relatively small (< 10 ha) and contain a variety of amenities such as playgrounds, trails, benches, picnic tables, basketball courts, tennis courts, baseball diamonds, and grass fields for active play. The LAA also overlaps the Bridgeport Trail and Shell Road Trail.

Deas Island Regional Park is situated on both sides of the south end of the Tunnel on Deas Island, in Delta (**Table 5.3-11**). The park entrance is at the northeast end of the island, with access from River Road. Facilities within the park include a picnic shelter, 40-person group camp area, and an old schoolhouse building for holding functions. Activities within the park include fishing, cycling, horseback riding, watersports, and hiking trails. There are also organized nature walks in the park. The Island Tip Trail crosses the Tunnel on the north side of Deas Island (**Table 5.3-11**).

The Millennium Trail connects Crescent Drive and Ferry Slip Road to Deas Island. The trail follows the shoreline east from Marina Garden Estates, with an underpass for the Highway 99 ROW to link with the east section of River Road. Another western arm of the trail connects from Neilson Grove Elementary School to the underpass. An unpaved trail follows Boundary Bay from Tsawwassen to Surrey (Corporation of Delta 2015). In Richmond, the Richmond Loop trail to the west of the Steveston interchange and west of the LAA connects from the dyke along the Fraser River to Shell Road (The Trails Society of British Columbia 2014).

John Oliver Park, a municipal park in Delta, is situated at the Highway 99 interchange and contains sports fields and a clubhouse.

The Delta Golf Club is at the eastern border of Delta with Surrey, at the corner of Highways 10 and 99. The course is open to the public and features a clubhouse and banquet hall (Delta Golf Club 2009).

Public Utilities and Other Uses

In Delta, the Vancouver Landfill is an operational landfill situated north of the Project alignment. It accepts municipal solid waste and construction waste from the Metro Vancouver area. The landfill operations are conducted in accordance with the 2014 “Design, Operations & Progressive Closure Plan for the Vancouver Landfill” and agreements with Metro Vancouver and the Corporation of Delta which expire in 2037 (City of Vancouver Engineering Services 2015).

The Lulu Island- Delta Water Main crosses the South Arm of the Fraser River within the LAA to the west of the Project. It has an upland section on the southern tip of Deas Island, outside of the Deas Island Park boundary. In addition, the River Road West Water Main falls within the LAA on the south side of the Fraser River adjacent to works that will be undertaken in and around River Road and Green Slough. During construction, access for Metro Vancouver to the Lulu Island-Delta Main and River Road West Main will be provided, as it is for other utilities where access is potentially affected by the Project, to ensure site safety and coordination between Metro Vancouver’s requirements and construction of the Project.

In Richmond, an overpass for the CN rail line crosses Highway 99, south of Rice Mill Road and north of the Fraser River South Arm. The Burlington North Santa Fe rail crosses Highway 99 on the east side of Delta.

A BC Hydro electrical substation is situated south of the Project alignment, close to the intersection of Ladner Trunk Road and 64th Street. Rights of way for a BC Hydro transmission line parallel the highway alignment between the Delta works yard and Deas Island in Delta, and between Rice Mill Road and Richmond Nature Park in Richmond. BC Hydro has a permit with the Ministry for the sections of line within the Ministry’s ROW on Deas Island, in the Tunnel and other areas.

With decommissioning of the Tunnel, the existing BC Hydro transmission line will be reconfigured to a crossing of the Fraser River outside of the Tunnel, but within the existing highway right-of-way. Currently, three crossing options are being considered. Regardless of the option selected by BC Hydro, as with other utilities relocations within the highway right-of-way, physical works to be undertaken in support of utilities relocations are not considered to be within the scope of the Project and are not directly considered in the effects assessment. Where residual effects resulting from utilities relocations may occur, on VCs also potentially affected by the Project, such effects are considered in the context of the cumulative effects assessment.

Summary of Existing Conditions by Project Segment

Key information on OCP land use designation and land use within or adjacent to the Project alignment is summarized by Project segment in **Table 5.3-8**.

5.3.2.6 Regional Growth

Regional growth strategies are managed in accordance with policies and land uses outlined in Metro Vancouver's RGS (2015), local government RGSs and OCPs, and the provincial Agricultural Land Commission for agricultural land. The location and density of existing and future land uses are governed by the land use designations in these plans (**Sections 5.3.2.4 and 5.3.2.5**), and are based on projected population and employment levels as well as land use supply and demand. While planning documents are regularly reviewed and updated, there is no indication that the regional land use designations will change to alter the supply of land for particular uses; however, changes to land use density within the broader categories may change as a component of normal development processes. For example, the ALR and the urban containment boundaries are not expected to change in any substantial manner and vacant available land for new development is constrained by the existing planning regime (Site Economics Ltd 2016; Coriolis 2014). The following discussion presents summaries of population and residential development trends, employment distributions, and industrial land use availability.

Metro Vancouver has been experiencing the same trends for population growth as the rest of Canada: households are smaller; more people live alone; and couples have fewer children. In 2006, Metro Vancouver's average number of persons per household was 2.55; single detached houses at 3.13; townhouse at 2.68; low-rise apartments at 1.94; and high-rise apartments at 1.70. This is compared to an average of 2.6 persons per household for the region, in 2011 (Site Economics Ltd 2016).

Metro Vancouver has experienced significant population growth since 1971. During the most recent Census period (2006- 2011), Metro Vancouver population grew by 6.5% or nearly 200,000 (i.e., nearly 40,000 per year on average). The population of Surrey grew by 120,000 (from 347,000 to 468,000) during the 2001-2011 period. With an approximately 35% growth, Surrey's growth over this period was higher than the regional average. Richmond also grew significantly, while growth was much lower in Delta (Site Economics Ltd 2016).

Future population predictions for the Metro Vancouver region indicate growth of approximately 1.1 million people total from 2011 to 2041 for a total population of 3.4 million (Metro Vancouver 2015). In general terms, Surrey and Vancouver are projected to accommodate a significant amount of the future population growth for the region. Strong population growth is forecasted to continue, with Surrey growing to 770,000 in 2041. Meanwhile, Delta is projected to grow from 102,000 in 2011 to 121,000 in 2041, and Richmond from 194,000 to 280,000 in the same period.

As future population growth is predicted to remain strong, demand for housing can also be expected to remain strong. The more urban municipalities in Metro Vancouver, such as Vancouver, Richmond, and Burnaby will have larger concentrations of employment, while Delta's employment will be more dispersed, consistent with prevailing land use designations and local population and employment volumes.

Metro Vancouver's RGS seeks to protect the region's industrial land base and promote the intensification of industrial use on those lands (Metro Vancouver 2013). As of mid-2010s, the inventory of vacant industrial land was approximately 6,600 acres. However, this includes land that has various constraints, such as poor location or a servicing limitation. The existing industrial land base may be depleted in the early to late 2020s, depending on the growth scenario (Metro Vancouver 2013).

Table 5.3-9 Population, Dwelling Units and Employment Predictions

| Sub-region | Total Population | | | | Total Dwelling Units | | | | Total Employment | | | |

Notes: Retrieved from Metro Vancouver's Regional Growth Strategy (2015).

5.3.3 Potential Effects

This section discusses anticipated interactions of Project components and activities with land use. Information on mitigation of potential effects, including design measures to avoid adverse effects, is provided in **Section 5.3.5** (i.e., effects remaining following the implementation of mitigation measures) and described in **Section 5.3.4**. A discussion of potential cumulative effects on land use is presented in **Section 5.3.6**. Potential Project-related effects on marine uses, including recreational marine use, are addressed in **Section 5.2 Marine Use**.

Further analysis of potential Project-related effects on Aboriginal Interests related to land use, and measures to address such potential effects is included in **Section 10.1.3**.

5.3.3.1 Project Interactions

An overview of potential interactions between Project components and activities and land use during Project construction and operation is provided in **Appendix B**. A preliminary evaluation of the potential effects of Project interactions on land use, intended to focus the assessment on those interactions of greatest importance, is presented below. Interactions rated as having no effect are not considered further in the assessment.

Land Use Subcomponent

Construction: Small portions of adjacent land parcels may need to be acquired to accommodate the Project alignment, which could influence land use within or adjacent to those parcels. Project-related activities such as construction of the bridge, bridge approaches, and ramp connections, as well as interchange upgrades may lead to disturbances due to changes in traffic patterns and access to commercial, recreational, and emergency services. These interactions are expected to be temporary and site-specific.

Operation: Once operational, interaction of the Project with land use is expected to be limited to maintenance activities involving change in traffic patterns and access, shadows cast by the new bridge and approaches, and potentially through changes in noise, visual quality and air quality. Maintenance will be carried out in accordance with the Ministry's standard operating practices (B.C. MOTI 2003).

Regional Growth Subcomponent

Construction: The assessment recognizes that potential changes to regional growth patterns could evolve during planning and construction of the Project in anticipation of improved access; however, it can be assumed that changes, if any, are more likely to substantially occur during the operational phase.

Operation: Improved transportation infrastructure has the potential to influence population and employment distribution within the region, as well as the development and distribution of non-residential land.

5.3.3.2 Project Effects

This section summarizes the methods used to assess potential Project-related effects on land use that may result from interactions with the Project during construction and operation. The assessment of Project effects considers discussions with stakeholders, reviews of the Ministry's previous provincial highway assessments (B.C. MOTI 2006a, 2007), a review of the Application Information Requirements for the Project, experience from past projects and activities, and professional judgement of the Project team.

5.3.3.3 Land Use Subcomponent

Potential Effect #1: Consistency with Land Use Plans and Designations

The desktop review of relevant federal, provincial, regional, and municipal land use planning documents presented in **Section 5.3.2.4** indicates that the Project, while not specifically identified in all such documents, is generally consistent with long-range plans, including land use designations, to accommodate regional population growth and economic development. Through the desktop review, the goals and objectives of key planning documents were compared against the key Project attributes that support them as described below and summarized in **Table 5.3-11**.

Metro Vancouver and TransLink Plans: The Project supports the Mayors' Council vision (2015) by reducing congestion, funding transit infrastructure, and creating new pedestrian and cycling opportunities to help make these modes of transportation more viable for commuting and other personal trips. The Project also supports TransLink's RTS (2013) by integrating the overall Project design with the regional transportation network. The RTS guided the development of TransLink's *2014 Base Plan and Outlook* (2013). While this plan does not specifically refer to the Tunnel or its replacement, the plan identifies a goal to strategically maintain and grow the existing transportation system with partners.

VFPA Land Use Plan (2014): The VFPA Land Use Plan includes goals to ensure the safe and efficient movement of port-related cargo, traffic and passengers throughout the region. The Plan has objectives to preserve, maintain and improve transportation corridors and infrastructure, including support for maintaining and improving corridors outside of VFPA's jurisdiction, and to collaborate with industry, transportation agencies and local governments. The Project's Highway 99 improvements and objectives to improve safety and achieve travel time savings are consistent with objectives of the Land Use Plan.

Metro Vancouver RGS (2015): Key Project attributes align with and support the goals and strategies of the RGS including those related to the goal of Support Sustainable Transportation Choices. In this context, the RGS acknowledges TransLink’s mandate for the regional transportation system and communicates to TransLink its objectives to implement strategic transportation plans that support focused growth in Urban Centres, Frequent Transit Development areas, and other appropriate areas in the Frequent Transit Network (Metro Vancouver 2015). In addition, the RGS identifies general transportation goals, including support of transportation systems required to nurture a strong regional economy.

The Project includes improved opportunities for high-occupancy vehicles, transit, cycling and walking, which are consistent with and support the RGS, and will result in congestion reductions, travel time savings and improvements in air quality that also align with RGS goals and strategies.

Richmond OCP (2016): Highway 99 improvements, including the new Steveston Highway interchange, contribute to Richmond’s objective to better manage high traffic volumes moving to and from Highway 99. The OCP’s mobility and access objectives to optimize the existing road network, improve circulation and goods movement, and reduce the need for added road capacity, includes reference to supporting “the implementation of improvements along Highway 99, including an upgraded interchange at Steveston Highway and a new interchange at Blundell Road, to enhance local circulation and connectivity, increase safety and improve goods movement”.

Delta OCP: Delta’s OCP (2014) includes an objective to reduce traffic congestion and mitigate its effects, working with provincial and federal governments and agencies to secure improvements to transportation systems and maximize the capacity of existing corridors, wherever possible, before building new corridors to accommodate increasing traffic demand. The Project’s congestion reduction objectives within an existing corridor are consistent with key goals and objectives of this OCP.

Surrey OCP (2014): Surrey’s OCP has objectives to develop efficient and adaptable infrastructure systems and provide a comprehensive transportation network that offers reliable, convenient, and sustainable transportation choices. The OCP defines several relevant policies under this objective which include efficiently managing, maintaining, and improving a transportation system for all modes of transportation, reducing congestion, and coordinating with strategic operational plans of the Ministry. The Project aligns with these policies.

Specifically, it provides for all modes of transportation (including new bike and pedestrian options across the new bridge), reducing congestion, and improving transportation reliability.

The intended use of the Project alignment to support the proposed improvements, as presented in the **Section 16.1 Reference Concept**, is consistent with policies in existing local and regional plans to provide safe, reliable, transportation options that reduce congestion while also encouraging other modes of transportation. While the proposed Project is not specifically identified in all plans, the objectives of the Project are considered to support the land use policies in local and regional land use plans. Therefore, this effect is not considered further in this assessment.

Table 5.3-10 Project Consistency with Land Use Plans

| GMT Goals and Attributes ¹ | Land Use Plan | | |
|---|---|---|---|
| | Metro Vancouver RGS ² | Mayors' Council Vision ³ and TransLink RTS ⁴ | Richmond, Delta, and Surrey OCPs ^{5, 6, 7} |
| <p>Relieve congestion and improve reliability:</p> <ul style="list-style-type: none"> • Dedicated transit/HOV lanes and integrated transit stops. • Improve travel time reliability and save round-trip commuters up to 30 minutes a day. • Support 2045 population and employment growth projections. • By 2045, transit service between King George Boulevard and Bridgeport Road will be 20 minutes shorter than without improvements. | <ul style="list-style-type: none"> • Support efficient movement of vehicles. • Support regional population/employment growth projections. | <p>Mayors' Vision</p> <ul style="list-style-type: none"> • Reduce traffic congestion by 10 per cent, allowing drivers and transit users to save 20-30 minutes per day on some of the region's most congested corridors. <p>RTS</p> <ul style="list-style-type: none"> • Increase local and regional connectivity and improve goods movement • Provide additional capacity where needed to improve travel-time reliability on key goods movement corridors in a way that does not increase general purpose traffic. • Optimize roads and transit for efficiency, safety and reliability • Make travel more reliable. • Make it easier and less stressful to get to work and school | <p>Richmond</p> <ul style="list-style-type: none"> • Enhance transit service to better allow all trips to be made using a refined hierarchy of services tailored to meet the community's mobility needs. <p>Delta</p> <ul style="list-style-type: none"> • Provide a local road network that safely, efficiently and effectively enables movement of people and goods. <p>Surrey</p> <ul style="list-style-type: none"> • Provide a comprehensive transportation network that offers reliable, convenient, and sustainable transportation choices. • Reduce congestion, and coordinate with strategic operational plans of the Ministry. |
| <p>Provide more transportation options:</p> <ul style="list-style-type: none"> • Support additional transit with continuous dedicated transit/HOV lanes and integrated transit stops. • The bridge will accommodate future rapid transit. • New pedestrian and cyclist paths and connections, to make these viable travel options between Delta and Richmond. • Tolls will encourage transit and car-pooling and limit traffic growth over time. • Improve community connectivity and access to Deas Island Regional Park. | <ul style="list-style-type: none"> • Support sustainable transportation choices. | <p>Mayors' Vision</p> <ul style="list-style-type: none"> • Increase bus service for more reliable, more frequent and extended service. • Better connections to transit through pedestrian improvements. • Improve/extend bus service and expand rapid transit, to provide a real alternative to driving for those who can use it. • Make cycling a safer and viable travel choice. • Encourage alternatives to vehicle traffic, with direct emphasis on pedestrian, cycling and transit. <p>RTS</p> <ul style="list-style-type: none"> • Increase transportation options. • Invest in walkway, bikeway and transit networks | <p>Richmond</p> <ul style="list-style-type: none"> • Increase the priority of sustainable transportation modes (cycling, rolling, walking) while maintaining an adequate balance in road capacity for all users. <p>Delta</p> <ul style="list-style-type: none"> • Promote use of public transit and work to make it more attractive to users. • Promote alternate modes of transportation with safe and attractive facilities. • Reduce travel demand within Delta, and between Delta and other municipalities. <p>Surrey</p> <ul style="list-style-type: none"> • Manage, maintain and improve transportation system for all modes of transportation • Support transit oriented development along major corridors linking urban centres and employment areas |

Potential Effect #2: Compatibility with Adjacent Land Uses

The Project is considered compatible with adjacent land uses where indirect effects of the Project do not adversely interact with existing and planned land uses during the operational phase of the Project. Potential effects associated with Project construction activities (i.e., noise, traffic, air) are temporary in nature and not considered in assessing compatibility with adjacent land use but are considered in the context of **Potential Effect # 4 (Disturbance to Residential, Commercial and Industrial Land Uses)**.

Potential Project-related indirect effects during operations that could interact with existing and planned land uses include: changes in traffic congestion on access routes in adjacent neighbourhoods, noise levels on sensitive use lands along the length of the Project alignment, air quality, and visual quality, and shadowing in the vicinity of the new bridge.

With respect to parks and recreational land uses adjacent to Highway 99, including Deas Island Regional Park, the Project will not change the existing land use within the right-of-way. As such, it is considered to remain compatible with the adjacent land use associated with the Park. Recognizing that the Project includes changes to existing infrastructure, and has the potential to result in changes to conditions within the Park, disturbance to recreational land uses in the vicinity of the new bridge is considered under **Potential Effect # 5 (Disturbance to Recreational Uses near the New Bridge)**.

A desktop review of planning documents for all levels of government indicates that adjacent and proximal land uses are compatible with the Project. Over the past several decades, since the establishment of the Highway 99 corridor, urban development and agricultural uses have evolved along the Highway 99 corridor. During this time, development has taken place in way that takes into account proximity to Highway 99 by providing building setbacks and vegetated buffers for separation and minimizing the placement of sensitive receptors like schools, institutions, and residences immediately adjacent to the Highway. Because these land uses have evolved over time with the Highway, they are considered compatible with the proposed Project improvements, however additional support for this conclusion is presented below.

Traffic: Traffic safety, traffic volumes, congestion, and mode share, and the anticipated changes resulting from Project components and activities are addressed in **Section 5.1 Traffic**. The Project has been designed to address issues related to current and future traffic safety, congestion, and reliability, and to help achieve regional mode share targets by facilitating travel across the Fraser River by transit, HOVs, cycling and walking. As proposed, Project-related improvements, including tolling, will help moderate traffic growth while effectively serving forecast demand at the crossing. Measures in the Ministry's Intelligent Transportation Systems

(ITS) to integrate communication and information technology to better manage and operate B.C.'s transportation system, will support improved operational performance on the Highway and, in doing so, will reduce traffic congestion within adjacent local road networks and provide improved access to the Highway. In this context, the Project is anticipated to have a positive effect on traffic conditions along the Highway 99 corridor and anticipated changes in traffic are not anticipated to change the compatibility between land use on the existing right-of-way and that in adjacent areas.

Noise: Land uses sensitive to changes in noise conditions are considered to be residences, hospitals, educational facilities, places of worship, libraries, museums, and passive recreational facilities (parks). As discussed in **Section 4.10 Atmospheric Noise**, mitigation measures will be implemented at select locations to address Project-related changes in noise levels during operation. With the application of mitigation, ambient noise levels during operation are expected to be lower than current levels—on average by 4 dBA at residences and 1.5 dBA at schools and places of worship. Noise levels at parks adjacent to the Project, including Deas Island Regional Park (discussed further below), are expected to increase by varying degrees dependent on the distance from the highway, but generally will remain below levels that warrant mitigation for residences, schools, and places of worship. With the implementation of mitigation identified in **Section 4.10 Atmospheric Noise**, land use within the existing right-of-way is anticipated to remain compatible with adjacent land uses.

Air Quality: Because the Project will result in improvements in air quality, this potential indirect effect is anticipated to improve compatibility and is therefore not considered further (**Section 4.9 Air Quality**).

Visual: Potential changes to viewscales were considered in **Section 5.5 Visual Quality**, at viewpoints considered sensitive to visual quality, by considering site-specific changes in visual quality class (VQC). Key conclusions of the assessment include:

- The new bridge will add noticeable visual features to the landscape and will change visual conditions adjacent to the Project alignment.
- Replacement of interchanges also has the potential to change visual conditions at these locations.
- At distances greater than one kilometre, the bridge deck will merge with the natural landscape and the main visual features will be the bridge towers.
- Vegetated buffers will minimize visual effects to residential developments within close proximity to the bridge in Delta.

- Changes in visual quality at interchanges will be minor as visual quality in such areas is currently influenced by existing transportation infrastructure.
- Changes are identified from several viewpoints in the vicinity of the new bridge (within 1 km); however for the majority of the viewpoints, the VQC rating does not change.

As such, Project-related changes in visual quality are not anticipated to result in changes in compatibility between land use on the existing right-of-way and that in adjacent areas. The influence of changes in viewsapes on recreational land uses in the vicinity of the new bridge is considered separately in **Potential Effect # 5 (Disturbance to Recreational Uses near the New Bridge)**.

Shadow: During operations, shadows will be cast by the new bridge deck, piers, and support towers over areas where the existing highway infrastructure does not create shadows. A study was conducted using a computer-based visual simulation program (AutoCAD) to illustrate the extent and location of shadows from the new bridge at different times of day during the winter and summer solstices (**Appendix A**). As shown on **Figures 1 and 2 of Appendix A**, the longer shadows during the winter solstice transit a slightly larger area compared to the areas shaded during summer solstice.

Land uses that are commonly considered sensitive to shadowing include useable outdoor spaces associated with residential, institutional, and commercial uses; recreational areas (discussed in **Potential Effect # 5 Disturbance to Recreational Uses near the New Bridge**); and, agricultural lands (discussed in **Section 5.4 Agricultural Use**). Within the Project alignment, the potentially sensitive land uses are primarily located in Delta. These uses include the existing residential area of Riverwoods, east of the Highway 99, and Captain's Cove Marina. The shadow effects on these areas during winter and summer solstice are further described below. The future residential development in Marina Garden Estates west of the Highway 99 ROW and River House Marina are not expected to experience shadow effects from the new bridge.

Computer simulations indicate that during the winter solstice (December 21), when the sun is lowest in the sky, residents of Riverwoods will experience some shading after 12 p.m. until dusk as the shadow of the new bridge deck transits their housing development. Up to nine units at a time will experience shading for a period of about two hours in the afternoon. This change in shading could result in temporary reduction in the amount of natural light and solar gain. During the summer solstice (June 21) shadows will be cast at 7 a.m. on two berths at the tip of the easternmost finger of the Captain's Cove Marina. This shading would last for less than two hours. The residents of units located on the western side of Riverwoods would experience some

shading after 7 p.m. until sunset as the bridge deck shadow moves across the complex. In the western marina, two berths would be shaded for a short time during the early morning in summer. Given the variability in individual responses to shading, the short periods of shading, and the relatively few number of residences and marina berths affected by shadows, this effect is considered negligible and is not carried forward in this assessment.

Reduced traffic congestion and improvements in local air quality associated with the Project will improve existing conditions and enhance compatibility between land use within the existing right-of-way and adjacent land uses. With the implementation of mitigation measures applicable to the operations phase, as referred to in the preceding section (i.e., traffic, noise, visual quality), the Project is considered compatible with existing and planned land uses and potential effects to land use compatibility are not carried forward.

Potential Effect #3: Change in the Area of Existing Land Uses

The Project will require the use of minor areas of additional land outside the existing Highway 99 ROW in Richmond and Delta. Based on the reference concept, a total of 716 m² of private land (non-agricultural) are required for the Project (**Table 5.3-11**). For the affected parcels, only small narrow lengths of land adjacent to the existing ROW would be needed. The area removed from agricultural use will be offset by surplus ROW being needed for productive farming and is considered in detail in **Section 5.4 Agricultural Use**. The potential effects of construction on biophysical values associated with existing ESAs are assessed in **Section 4.4 Fish and Fish Habitat** and **Section 4.8 Terrestrial Wildlife**.

Table 5.3-11 Portions of the Project Alignment not within the Highway 99 Right-of-Way

| Land Use | Area (m ²) | Description |
|--------------------------------|------------------------|---|
| Limited Mixed Use | 12 | North west corner Steveston interchange |
| Commercial | 32 | North east side of east Hwy 17A onramp |
| Environmentally Sensitive Area | 340 | North west side of River Road alignment |
| Commercial | 78 | Hwy 17A interchange, north of north east ramp |
| Industrial | 254 | Hwy 17A interchange, north of north east ramp |

The Ministry will acquire properties in accordance with Ministry policies and best practices that typically guide property acquisition. Once the properties have been acquired, no further changes in the area of existing land uses are anticipated. Therefore, this effect is not considered further in this assessment.

Potential Effect #4: Disturbance to Residential, Commercial and Industrial Land Uses

During the Project's construction phase, residential, commercial and industrial land uses in proximity to the Project alignment may experience adverse effects (e.g. delays in access, temporary access restrictions, construction noise). Potential disturbance effects to marine and agriculture uses are presented **Sections 5.2 Marine Use** and **5.4 Agricultural Use** respectively, and not addressed herein.

The construction phase includes preparing the sites, upgrading interchanges, widening the highway, constructing a new bridge, and decommissioning the Tunnel and Deas Slough Bridge. Portions of the Project alignment will be used temporarily as laydown areas for equipment and construction materials. To protect the safety of workers and the public and facilitate an efficient construction schedule, periodic changes or restrictions in access in and adjacent to the Project components will be required as construction proceeds.

Potential disturbance effects on land use during construction include those related to the Traffic, and Marine Use VC assessments and the Noise IC assessment. These temporary disturbances are summarized below:

- Traffic
 - Travel patterns may be temporarily affected, or travel speeds reduced for safety. Residential and mixed use areas adjacent to the Project alignment in Richmond and Delta, especially near the interchange upgrades and along the south shore of Deas Slough, may experience periodic delays due to traffic controls, including possible rerouting of traffic.
- Marine Use
 - Restricted access to shore-based facilities: New bridge construction over the Fraser River South Arm and Deas Slough, as well as decommissioning of the Tunnel and Deas Slough Bridge, could result in periodic temporary restrictions in access to marinas, wharves, and boat launches.

- Noise:
 - The Project is located in an area where existing noise levels are high and dominated by noise from traffic on Highway 99 and connecting roadways. Temporary construction related sound may affect noise-sensitive receptors. The change in noise levels will vary relative to the distance from the noise source and type and duration of construction activity. While ambient sound levels include traffic noise, it is likely the increase in noise due to construction will be perceptible at some receptors.

Potential Effect #5: Disturbance to Recreational Uses near the New Bridge

The recreational use experience in the Deas Island Regional Park and the Millennium Trail may be affected by Project-related construction and operation activities as summarized below.

Construction

- Traffic/Access
 - Restricted use of Millennium Trail: Pedestrian and cycling access to the Millennium Trail section that currently loops under the Deas Slough Bridge in Delta would be temporarily restricted during construction of the new bridge. Users would still be able to use sections of the trail on either side of the restricted area.
 - Restricted areas in Deas Island Regional Park: Recreational use of the Island Tip Trail, which passes through the Project alignment within Deas Island Regional Park, would be temporarily restricted during new bridge construction and Tunnel decommissioning. The main access to the park, parking areas, boat launch, beach area, and major trails would not be directly affected by construction.
- Marine Use: For recreational watercraft located in Deas Slough, temporary periods of restricted access may affect the operations of marinas and water-based recreation programs with shore-based facilities (e.g., rowing club based in Deas Island Regional Park).
- Noise: Noise levels have been assessed in **Section 4.10 Atmospheric Noise**. Daytime noise levels at locations within Deas Island Regional Park may increase due to bridge construction activity including intermittent pile driving activity. While park users may be acclimatized to existing noise conditions associated with vehicle traffic on Highway 99, the increases in baseline noise levels during construction are expected to be perceptible.
- Air Quality: potential incremental changes to air quality associated with highway construction are well understood, and implementation of mitigation measures described in **Section 5.3.4** are expected to minimize potential Project-related effects in air quality during Project construction, with no anticipated residual adverse effects.

In summary, during construction, access restrictions and noise are anticipated to temporarily adversely affect recreational activities in the vicinity of the replacement bridge.

Operation

During the operation phase, both potential beneficial and adverse effects of the new bridge and highway improvements are anticipated.

Potential benefits to the Deas Island Regional Park during operation include the following:

- **Land Use:** Access to the western end of the Deas Island Regional Park will be improved following decommissioning of the Tunnel. In addition, the useable area of the Ministry's ROW adjacent to the Park will be increased through the replacement of the Tunnel with the new bridge.
- **Vegetation:** On completion of construction, areas now required for the Tunnel will be revegetated in accordance with the Terrestrial Vegetation and Wildlife Management Plan (**Section 4.7 Vegetation**). Revegetation of such areas will use native species and the selection of species will take into account ecological conditions in adjacent areas with Deas Island Regional Park. In addition, the Ministry will engage with Metro Vancouver Parks and Delta Department of Parks, Recreation and Culture during design activities regarding the alignment of the reconnected Island Tip Trail and Millennium Trail. Shoreline areas will be restored, and contiguous.
- **Air Quality:** During the operational phase, no Project-related adverse residual air quality effects are anticipated as concluded in **Section 4.9 (Air Quality)**. The new bridge is anticipated to result in an improvement in air quality conditions due to eliminating congestion at the crossing and better dispersion from traffic moving over an elevated bridge rather than through the Tunnel. Such access improvements will also support ongoing use of the Park.

Potential adverse effects may result from shadows, noise, and visual disturbances as follows:

- **Shadow:** Computer simulations indicate that during the winter solstice (December 21), when the sun is lowest in the sky, a greater area of Deas Island Regional Park, to the east of the new bridge, will experience shading at some time throughout the day compared to summer solstice. The affected areas are mainly used for trails. Further, users of the Millennium Trail will experience some shading as they travel the trail corridor. During the summer solstice (June 21) when the sun is highest in the sky shadows will be cast on Deas Island Regional Park over an area where trails are located. From dawn to dusk, the shading will move from the west to the east over a distance slightly wider than the Project alignment. The Park's picnic areas and fields to the east of the new bridge will not experience shading. The Millennium Trail would experience the greatest amount of shading but because trail users are transient, they would experience the shading for a short period of time.

- **Noise:** **Section 4.10 Atmospheric Noise** considers potential changes in noise as a result of highway improvements, and forecast growth in traffic. Predicted changes in noise within Deas Island Regional Park range from a 4 dBA increase at its eastern end (approximately 1,200 m from Highway 99), to an approximate 10 dBA increase 350 m to the east and west of the Highway 99 centreline. This results in a predicted level of 50-57 dBA. While the Ministry's *Policy for Assessing and Mitigating Noise Impacts from New and Upgraded Numbered Highways* (Wakefield Acoustics Ltd. 2014) does not include quantitative noise parameters for passive parks, this noise level is below the thresholds for mitigation for other identified land uses. Current recreational users in the park and on trails may be acclimatized to the existing condition, but will likely initially notice the change in noise levels.
- **Visual:** **Section 5.5 Visual Quality** assessed potential visual effects of the bridge at viewpoints including those within the vicinity of the new bridge. The presence of the new bridge will add noticeable visual features to the landscape and result in changes in visual conditions at certain viewpoints. In Deas Island Regional Park, the visual quality classes change from "modification" to "maximum modification" for the viewpoint closest to the new bridge, and "retention" to "partial retention" at the east end of Deas Island Regional Park. Viewpoints adjacent to the southern end of the new bridge, including a Millennium Trail site, will change to "maximum modification". The Ministry will engage with the Corporation of Delta regarding potential vegetation buffers to be installed within 150 m on either side of the bridge alignment. In designing vegetation buffers at these locations, screening views of the new bridge will need to be balanced with the maintaining views of Deas Slough or the Fraser River and nearby mature vegetation. Potential residual visual effects are assessed as non-significant for the Project, noting that the findings are subjective because viewer perceptions and opinions vary.

In summary, during operation, changes in visual quality and noise are anticipated to have moderately adverse effects on recreational activities in the vicinity of the new bridge, some of which can be mitigated. Potential effects of shadow are not considered further, as it is anticipated that pedestrians and cyclists will be transiting the shaded trails in seconds or minutes and effects on the recreational experience are considered negligible. Countering disturbance affects noted above, the Project will also result in benefits to recreational land uses including those associated with increases in usable area for parkland, restoration of land and shoreline areas, and improvements in air quality.

5.3.3.4 Regional Growth Subcomponent

The regional growth subcomponent focuses on potential land use effects related to reducing existing congestion and improving access and mobility in the Project corridor. Given the temporary nature of construction activities, no effects on regional land use considerations are expected as a result of construction phase activities, and not carried forward further in the assessment. As such, the assessment of potential effects related to changes in the regional growth subcomponent focus on the operations phase of the Project.

The primary focus, with respect to potential Project related changes in regional land use, is potential effects on regional growth considerations associated with reductions in current congestion and improvements in access, mobility, mode choice and travel time reliability. The following section provides the assessment of potential effects on regional growth through a consideration of the two regional growth indicators.

Potential Effect # 6: Change in Regional Population Growth and Distribution

Reviews of recent transportation infrastructure projects in Metro Vancouver, including studies conducted by the Ministry (Site Economics, 2016) and TransLink (Coriolis, 2014), indicate that the Project is not likely to have a substantial effect on land use at the local or regional level because it does not provide new access to marketable and useable lands that were otherwise inaccessible. Rather, unlike new transportation infrastructure (i.e., new access), which can result in substantial changes in the distribution of population, improved highway access and highway connections encourage denser, land intensive, high quality forms of development within existing land uses.

Given the strong policy presence of Metro Vancouver's Urban Containment Boundary and the Provincial ALR, the opportunities for the Project to result in substantially different development from that considered in the RGS and OCPs of adjacent municipalities is extremely limited.

In anticipation of an improved crossing to address congestion at the George Massey Tunnel, TransLink retained Coriolis Consulting Corp. in 2014 to study the potential effects of the Project on changes in housing and population, and population serving employment forecasts to 2045. The study used regional RTM modelling to consider potential effects at a neighbourhood, or traffic zone, level. The modelling assumes a new bridge with four lanes in each direction (three general purpose lanes and one HOV/transit lane), a \$3 toll, and upgrades to major interchanges on Highway 99.

While the Project includes one additional lane in each direction (as well as additional provisions for improved transit, cycling and walking which were not modelled in the Coriolis study), it represents a similar improvement to access rather than new access. As such, the findings of the Coriolis study are considered relevant in the context of understanding the influence of the Project on the how predicted growth in population and employment would be accommodated in adjacent municipalities.

Modelling results from the Coriolis study indicate a small localized shift in population and employment growth as a result of the Project. An excerpt of the conclusions of this report follows:

- "The new bridge is not anticipated "to lead to a direct increase in the total regional rate of population or employment growth after completion, but it is an important component in sustaining the region's overall ability to access external markets and will help sustain the region's competitiveness."(Coriolis 2014, p.9)
- "South Delta and south Surrey will likely capture slightly higher shares of the total ground-oriented multi-family market (and therefore population growth) within the Project alignment, than in the absence of the new bridge. This will translate into slightly higher shares of population and population-serving employment (e.g., retail and service employment). There may also be a small shift in population growth from high-density nodes to south Delta and south Surrey. In the Coriolis 2014 scenario, about half of the projected shift in population growth from Richmond will locate in south Delta and about half will locate in south Surrey." (Coriolis 2014, p. 12)

TransLink independently verified the Coriolis study findings¹, noting only minor differences in modelled traffic volumes across the new bridge.

While some of the scope assumptions that Coriolis modelled are different relative to proposed Project, the Ministry's land use experts contend that the magnitude of these differences, such as 10 lanes instead of eight lanes, would be small and limited to a modest increase in the pace of development rather than a change in final population distribution (Site Economics 2016).

Local governments may choose to review/update their respective plans as required, to continue to accommodate higher density development within their Urban Containment Boundaries, as a part of the regular process of updating their OCPs; however, the overriding foundation of the Agricultural Land Reserve and the land use plan set out in Metro Vancouver's RGS (2015) would limit the effects that any such change might have. Because the Project is not anticipated to affect overall regional growth trends under the RGS or to substantially change the long-term population distribution, potential effects to regional population growth and distribution are not carried forward in the assessment.

¹ http://www.metrovancouver.org/boards/Transportation/Transportation_Committee-March_12_2014-Agenda-Revised.pdf

Potential Effect # 7: Change in Non-residential Land (Industrial and Commercial) Development and Distribution

The shortage of developable land in Metro Vancouver, to support non-residential (i.e., commercial and industrial) land use is well documented and a key focus of dialogue between all levels of government. Given awareness of the ongoing pressure for developable land to support regional economic development goals, regional and local governments indicated concerns that improved access, such as provided for the Project, could further increase demand for new sources of developable land resulting in encroachment into lands currently protected from development.

The Coriolis report (Coriolis 2014) concludes that the Project has the potential for a short term shift in the pace of light industrial development that occurs in Richmond, Delta and parts of south Surrey, but no overall effect on the total amount of light industrial employment, as noted in the following excerpt:

- “The George Massey Bridge and associated road network improvements could cause a shift in the pace of light industrial development that occurs in Richmond, Delta (e.g. Tilbury, Tsawwassen First Nation), and parts of South Surrey in the short term. We expect that these areas may develop at a slightly faster pace in the short term, with a corresponding decrease in the pace of development in South Burnaby and North Surrey. However, these areas (and the entire region) are likely to be constrained in terms of industrial land supply over the forecast period in any case, so by 2045 there is not likely to be a discernable difference in the total amount of light industrial employment in these locations” (Coriolis 2014, p. 10)”

Recognizing local and regional government’s concerns about potential land use changes as a result of the Project, the Ministry commissioned Site Economics Ltd. to review the influence of transportation infrastructure improvements on land use trends, including changes in availability of developable land, by considering recent local and international experience.

The study (Site Economics 2016) noted that most lands in Metro Vancouver are already developed, or in the process of being developed and that demand for real estate exceeds the limited supply of residential, commercial, industrial and agricultural land. Given the context that Metro Vancouver is considered a mature urban area, where demand exceeds supply, infrastructure development is recognized to follow growth, rather than to lead or shape it. As such, transportation projects that improve accessibility have a modest influence on the timing and nature of development forms and timing. Key findings from recent local projects are as follows:

- Alex Fraser Bridge (1986) – Many logistics and goods handling firms in Vancouver moved to Delta and Surrey and developed large tracts of land zoned for industrial use, while Vancouver re-developed to higher and better uses the sites vacated by these firms. Lands on the south side of the Alex Fraser Bridge experienced moderate and controlled change, which was almost always anticipated within the existing land use designations. The value of employment related land in Delta increased in response to development while the value of employment-related land in Vancouver also continued to grow. For both Delta and Vancouver, changes to employment-related land values focused on development areas that were already designated for development and did not entail changes to the existing land use designations or expansion of the developable land base. Almost 30 years later, today there remain intact areas of ALR near the Alex Fraser Bridge and along its corridor and land use designations have not notably changed.
- Golden Ears Bridge (2009) – Prior to the Golden Ears Bridge, Maple Ridge/Pitt Meadows land values had generally lagged behind the region due to lack of access. Following construction of the Golden Ears Bridge, the area has become an integral part of the region’s economy and vacant designated land values have increased by more than 10 per cent, moving closer to the regional average.
- South Fraser Perimeter Road (2013) – Denser, land intensive, high quality forms of industrial development are being seen throughout the Tilbury and Sunbury Industrial area of Delta in particular as well as along other industrial areas near or adjacent this new highway. While the pace and quality of industrial land use development has changed, this project has not led to substantial changes to land use designations.
- Port Mann/Highway 1 (2013) – This project has not substantially changed or expanded land areas designated for development.

Extrapolating the experience noted for other regional transportation improvement projects, to what would be anticipated as a result of the Project, Site Economics (Site Economics 2016, p2) concludes the following:

- “The influence of the Project on land use will be very moderate, primarily due to the lack of vacant developable land on both sides of the crossing, and the presence of strong and restrictive land use controls across the region.
- “Because the Project does not change Metro Vancouver’s Urban Containment Boundary, it can be reasonably anticipated that long-term development will focus on intensification of existing urban areas rather than expansion onto new land areas or ‘sprawl’.
- The only measurable influence of the Project is to add value and density to lands already designated for current and future development. There is no potential for the improved river crossing to change this or lead to the conversion of non-development land into development land.

- The potential for municipal governments to expand land areas for urban development is a separate local major policy decision beyond the scope of the proposed Project.
- Given the strength of existing land use policies such as the Agricultural Land Reserve, Metro Vancouver’s regional growth strategy and the Official Community Plans of Vancouver, Richmond, Delta, Surrey and White Rock, any significant changes in this regard are considered unlikely”

Given the severe lack of industrial land on both sides of the Fraser River, changes in development pressure on non-residential lands due to the improved access across the river is anticipated to be far less influential than already exists. As a result, the Project is not anticipated to substantially change current trends in industrial land use and development other than to encourage denser, land-intensive, high quality forms of industrial development and a faster absorption rate in both Delta and Richmond. This in term will support long-term economic growth that otherwise would have occurred outside of the region.

Because the potential effect of the Project to the use and development of commercial and industrial land is anticipated to be negligible, the potential effect is not carried forward in the assessment.

5.3.4 Mitigation Measures

This section describes the mitigation measures developed to avoid or reduce the potential adverse effects of the Project on land use, specifically, disturbance to adjacent land uses.

A hierarchical approach based on avoidance of potential effects first, followed by minimization or reduction of unavoidable effects was used in identifying strategies to mitigate potential Project-related effects on land use.

Measures to avoid potential adverse effects have been/will be incorporated into the Project considerations such as project design, and construction and operation procedures and practices. Where potential effects cannot be avoided through project considerations, standard mitigation measures, Best Management Practices (BMPs), and construction and operation environmental management plans (EMPs) will be implemented to minimize potential Project-related effects or reduce them to acceptable levels. These measures, described in general terms in the mitigation measures presented below, will be detailed in the Construction Traffic Management Plan (CTMP) and Marine Access Management Plan (MAMP) (**Section 12.0 Management Plans**), and are standard approaches used to address land use effects resulting from the construction and operation of transportation projects. The CTMP will follow the Ministry’s Traffic Management Guidelines for Work on Roads (B.C. MOTI 2001), Traffic Control

Manual (B.C. MOTI 1999), and Standard Traffic Signs and Pavement Markings Manual (Ministry 2000) for temporary lane markings. These mitigation measures are based on Ministry policies and practices and are known to be effective as they have been used in other transportation projects in the region, including the South Fraser Perimeter Road, the Port Mann/Highway 1 and Sea to Sky Highway Improvement projects. The assessment of the potential effects to the land use VC and subcomponents assumes that the mitigation measures proposed for components in the pathway of effects and complementary environmental and social effects assessment sections (**Sections 4.9 Air Quality, 4.10 Atmospheric Noise, 5.1 Traffic, 5.2 Marine Use, and 5.5 Visual Quality**) are implemented. The mitigation measures, described in these sections and summarized below, are considered effective measures to mitigate the indirect effects to land uses during construction and operation, and their implementation is assumed in the assessment of the residual effects in Section 5.3.5.

5.3.4.1 Avoidance

The Project has been designed to be largely within the existing Highway 99 ROW, thus avoiding displacement of nearby land uses where possible (potential effect # 2).

5.3.4.2 Minimization

Air Quality: Potential effects to land users from air quality will be minimized through the implementation of an Air Quality and Dust Control Management Plan, and the design and management of the Project to ensure optimum traffic flow conditions, in turn reducing congestion and emissions. Road dust during operation will be managed by cleaning the road where dirt, debris, sand, and gravel have accumulated at an appropriate frequency, in accordance with Ministry requirements for highway maintenance (B.C. MOTI 2010) (**Section 4.9.4**).

Noise: The potential effects from changes in atmospheric noise to sensitive receptors (and therefore sensitive land uses) will be minimized through the implementation of a Noise Management Plan in the Construction Environmental Management Plan (CEMP). The plan will describe equipment and activity restrictions to minimize noise, site specific schedules, best management practices to control construction noise, a noise monitoring program, and processes for community communication and consultation. Operational mitigation for sensitive receptors is proposed in accordance with the Ministry's *Policy for Assessing and Mitigating Noise Impacts from New and Upgraded Numbered Highways* (Wakefield Acoustics Ltd. 2014) (**Section 4.10.4**).

Vegetation: Potential effects to vegetation resources, relevant to park and protected area land uses, will be managed through environmental protection measures within the CEMP and the OEMP. The CEMP will include a Terrestrial Vegetation and Wildlife Management Plan, which will include invasive species management measures. Mitigation measures also include habitat enhancement for portions of a cattail marsh adjacent to River Road, and habitat offsetting in consultation with Aboriginal Groups through the creation of cattail marsh for those portions of lost marsh within the bridge footprint (**Section 4.7.4**).

Visual Quality: Potential effects to visual quality have been avoided or minimized through design considerations incorporated into the Project, and, where possible, the addition of vegetation buffers to screen views. In designing vegetation buffers at affected viewpoints in the vicinity of new bridge, the desire to screen views of the bridge will need to be balanced with the desire to maintain views of Deas Slough or the Fraser River and nearby mature vegetation. The Ministry will develop and share potential options for minimizing Project-related effects with stakeholders prior to finalizing the appropriate type and extent of vegetated buffers to be installed within 150 metres on either side of the bridge alignment (**Section 5.5.4**).

Traffic: A CTMP, as discussed in **Section 12.0 Management Plans**, will be developed and include a communications component. Richmond, Delta, and owners of property adjacent to the Project alignment, including Metro Vancouver, will be afforded opportunities to provide input regarding the timing and location of accesses, and options for pedestrians and cyclists along recreation trails. The CTMP will identify how information about construction activities, construction periods, and route options will be communicated to adjacent land users. Communication methods may include signage, a website, and a direct telephone line for information. Additional information on the CTMP is presented in **Section 5.1 Traffic**.

Development and implementation of a traffic management plan is a standard approach to minimize potential disturbance to other land uses, resulting from the construction of transportation projects. Specific mitigation measures to be implemented under the CTMP are based on Ministry policies and practices that are known to be effective in addressing potential traffic-related effects from other regional transportation projects.

Marine Use: A MAMP will be developed that includes a communications component, to manage access to marine uses along the Fraser River and Deas Slough. This plan will be part of the CEMP (**Section 12.0 Management Plans**). For a description of MAMP provisions, refer to **Section 5.2.4 Marine Use Mitigation Measures**.

Development and implementation of a marine access plan is a standard approach to minimize potential disturbance to other land uses, resulting from the construction of transportation projects in marine areas. Specific mitigation measures to be implemented under the MAMP are based on Ministry policies and practices that are known to be effective as they have been used to support other regional transportation projects.

Reconnect Recreational Trails

At the end of the construction phase, the Ministry will reconnect the Island Tip Trail, which passes through the Project alignment within Deas Island Regional Park, and would be disconnected during new bridge construction and Tunnel decommissioning. Also at the end of the construction phase, the Ministry will reconnect the Millennium Trail on the south shore of Deas Island slough within the Highway 99 ROW. The Ministry will engage with Metro Vancouver Parks and Delta Department of Parks, Recreation and Culture during final design and construction to confirm the alignment of the reconnected trails.

Reconnection of the existing recreation trails on completion of construction is considered an effective mitigation, in combination with mitigation measures for indirect effects presented in other sections, to minimize operational effects to recreational uses on Deas Island and the Millennium Trail.

5.3.5 Residual Effects and their Significance

After the successful implementation of mitigation measures, residual effects remain to disturbance to residential, commercial and industrial land uses during Project construction, and disturbance to recreational uses near the new bridge during Project construction and operations. These residual effects are characterized and assessed here following the methodology presented in **Section 3.0 Assessment Methodology**.

5.3.5.1 Characterization of Residual Effects

Residual effects are those that remain following implementation of the mitigation measures described in **Section 5.3.4**. Potential residual effects to land use considered further in this assessment include disturbance to other land uses.

The identified potential residual effects to land use are characterized with respect to direction, magnitude, extent, duration, frequency, reversibility, and likelihood. Definitions for ratings applied to residual effects criteria are presented in **Table 5.3-12**. A summary of criteria ratings for the potential residual effects on land use are provided for each residual effect.

Table 5.3-12 Criteria Used to Characterize Residual Effects on Land Use

| Criteria | Description | Definition of Rating | |
|-----------------------------------|--|----------------------|---|
| Direction | Overall nature of the residual effect | Adverse | Negative effect as a result of the Project |
| | | Positive | Beneficial effect as a result of the Project |
| | | Neutral | Neutral effect as a result of the Project |
| Magnitude (land use subcomponent) | Intensity of the effect relative to natural or baseline conditions | Negligible | No measurable change in land use |
| | | Low | A measurable change in land use, however, not readily distinguished from existing conditions |
| | | Moderate | A measurable change in land use, or within a land use designation, but which will not affect use in the remainder of the area |
| | | High | A measurable change in land use, or within a land use designation, which will affect use in the remainder of the area or cannot be accommodated elsewhere in the regional assessment area (RAA) |
| Extent | Geographic extent / distribution of the residual effect | Site | Effect is restricted to the immediate Project components |
| | | Local | Effect is restricted to the local assessment area |
| | | Regional | Effect is restricted to the RAA |
| Duration | Length of time over which the residual effect is expected to persist | Short term | Effect occurs during Project construction |
| | | Long term | Effect occurs for the operational life of the Project |
| | | Permanent | Effect occurs beyond the operational life of the Project |

| Criteria | Description | Definition of Rating | |
|---------------|---|----------------------|---|
| Frequency | Nature of the occurrence of the residual effect (e.g., how often the stressor affects the VC) | Rare | Effect occurs once |
| | | Uncommon | Effect occurs intermittently during Project construction or operation |
| | | Frequent | Effect occurs frequently during Project construction or operation |
| | | Continuous | Effect occurs continuously during Project construction or operation |
| Reversibility | Potential for the effect to be reversed or naturally return to baseline level after the disturbance has ceased (or after a period of time after the disturbance has ceased) | Reversible | Conditions will return to pre-Project state |
| | | Irreversible | Conditions will not return to pre-Project state |
| | | Change | Effect may fluctuate between positive and adverse for the duration of the disturbance |

Residual Effect #1: Disturbance to Residential, Commercial and Industrial Land Uses during construction

Changes in access during construction will be required to enable construction and assure safety. Even with implementation of the CTMP, construction activities in the Project alignment will likely result in some disturbance to adjacent land uses, primarily due to temporary changes in access. Implementation of a MAMP is expected to minimize potential effects on marine use as a result of temporary hindering of passage through, or use of, and access to a section of the Fraser River South Arm during Project construction (see **Section 5.3.6**). With the majority of the LAA used for agriculture or having low-density development, only a limited number of land uses will be directly affected by construction activities. Shore-based marina facilities in Deas Slough may require temporary changes in their activity schedules.

During construction, mitigation measures and best practices as discussed in **Section 4.10.4.1**, including equipment and activity restrictions, appropriate scheduling of construction activities, noise monitoring, and community communication, will be implemented to minimize potential Project-related effects on ambient noise conditions for sensitive receptors. However, frequent construction noise will be experienced in areas near active construction sites. The Magnitude of residual construction noise effects will vary from low to high, depending on receptor location relative to a construction site, and the nature of construction activity. The duration of residual noise effects will be short-term during construction of interchanges etc. and of moderate term during pile installation for the new bridge. During other construction activities, effects of lower magnitude will be experienced occasionally to frequently at receptor sites along the corridor for short durations. All construction-related effects on atmospheric noise will be temporary and fully reversible.

The magnitude of this residual effect is considered low because changes in land use are not readily distinguished from existing conditions or may be accommodated with minor changes in the timing of activities. Because the effects on other land uses would be experienced close to the areas of construction activities and during times of construction, the effects are considered local in extent, frequent in terms of timing, and short term in duration. The effects are reversible, being closely linked to the timing, extent, and location of construction activities.

The context for this Project is one of high resilience to change for the following reasons:

- Past improvements to highway infrastructure, including Highway 99 widening to accommodate a shoulder bus lane, construction of Highway 17, as well as ongoing municipal infrastructure servicing along roads, indicate proven capabilities to manage changes in transportation access during construction

- Development densities in the immediate vicinity of the Highway 99 corridor are generally low, except for the area around the Steveston Highway interchange and Bridgeport Road, reducing the number of affected land users

Existing land uses are expected to accommodate the proposed Project components and activities with only minor disturbances to the existing land uses at select locations. **Table 5.3-13** presents a summary of the criteria ratings for residual effect #1.

Table 5.3-13 Criteria Ratings for Residual Effect #1: Disturbance to Land Uses during Construction

| Criteria | Criteria Rating | Rationale for Criteria Rating |
|---------------|-----------------|---|
| Direction | Adverse | Construction activities in the Project alignment will result in some disturbance to adjacent land uses, primarily due to changes in access and construction noise. |
| Magnitude | Low | Changes in access can be accommodated with minor changes in timing of activities. The magnitude of construction noise is anticipated to vary with the location of the sensitive receptor. |
| Extent | Local | The effect would be experienced close to the areas of construction activities. |
| Duration | Short term | The effect would be experienced during Project construction. |
| Frequency | Frequent | The effect would be experienced during specific times of Project construction. |
| Reversibility | Reversible | Land use patterns will return to pre-Project state on completion of Project construction. |

Residual Effect #2: Disturbance to Recreational Uses near the new bridge during construction

The Proponent will engage with Metro Vancouver Regional Parks and Delta in developing access plans during the construction phase to minimize potential effects to access for recreational uses in Deas Island Regional Park and the Millennium Trail. Access to recreational uses will need to be temporarily restricted for periods of time to protect the safety of recreational users and workers and facilitate an efficient construction schedule. Access to the western portion of Deas Island Regional Park will be affected, but the main Park access, parking areas, boat launch, beach area, and major trails will remain available. Access to the Millennium Trail section that currently loops under the Deas Slough Bridge will be restricted while construction activities are in the area. Users will still be able to use sections of the trail on either side of the restricted area. These restrictions will likely affect a relatively small number of users for a short

period of time. Potential adverse residual effects are anticipated to be moderate in magnitude, local, short term, frequent and reversible. Deas Island Regional Park will continue to be available as an option for regional recreational users.

On completion of construction, areas now required for the Tunnel will be revegetated in accordance with the Terrestrial Vegetation and Wildlife Management Plan. Revegetation of such areas will use native species and the selection of species will take into account ecological conditions in adjacent areas with Deas Island Regional Park. In addition, the Ministry will engage with Metro Vancouver Parks and Delta Department of Parks, Recreation and Culture during design activities regarding the alignment of the reconnected Island Tip Trail and Millennium Trail. Shoreline areas will be restored.

During operation of the Project, potential adverse noise and visual residual effects to recreational uses in Deas Island Regional Park and portions of the Millennium Trail are anticipated to be moderate in magnitude, local, long term, and continuous. The extent to which the overall change to the recreational experience at Deas Island Regional Park is beneficial or adverse is subjective and will be perceived differently by different viewers.

The characterization of residual effects of disturbance to park and recreation areas in relation to land use is summarized in **Table 5.3-14** (during construction) and **Table 5.3-15** (during operation).

The context for this Project during operation is one of high resilience to change because the quality of the recreational experience currently encompasses the existing highway and tunnel, and the existing facilities will remain available in the long term.

Table 5.3-14 Criteria Ratings for Residual Effect #2: Disturbance to Recreational Land Uses near the new bridge during Construction

| Criteria | Criteria Rating | Rationale for Criteria Rating |
|---------------|-----------------|---|
| Direction | Adverse | Construction activities in the Project alignment will result in some disturbance to adjacent land uses, primarily due to changes in access and noise. |
| Magnitude | Moderate | Access to the majority of the affected recreational land uses will not be restricted. Access to the Millennium trail crossing at the Deas Slough bridge and the western end of Deas Island Regional Park will be temporarily restricted. Construction noise will be distinguishable from existing conditions. |
| Extent | Local | The effect will be experienced close to the areas of construction activities. |
| Duration | Short term | The effect will be experienced during Project construction. |
| Frequency | Frequent | The effect will be experienced during times of Project construction. |
| Reversibility | Reversible | Access routes will be reconnected on completion of construction. |

Table 5.3-15 Criteria Ratings for Residual Effect #2: Disturbance to Recreational Land Uses during Operation

| Criteria | Criteria Rating | Rationale for Criteria Rating |
|---------------|-----------------|--|
| Direction | Adverse | Noise, and visual effects. |
| Magnitude | Moderate | Visual and noise residual effects will be distinguishable from existing conditions. |
| Extent | Local | The effect will be experienced close to the areas of recreation activities. |
| Duration | Long term | The effect will be experienced during Project operation. |
| Frequency | Continuous | The effect will be continuous |
| Reversibility | Irreversible | Land use patterns will return to pre-Project state or be improved on completion of Project construction. Sound and visual residual effects will persist for the life of the Project. |

5.3.5.2 Likelihood of Residual Effects

The likelihood of residual effects occurring on land use is influenced by existing conditions, Project activities, potential effects, and the implementation of mitigation measures. Information on these factors is used to determine the likelihood of there being an adverse residual effect. The likelihood of a residual effect on land use occurring is characterized as:

- Low – Chance of the residual effect to occur is less than 25%.
- Moderate – Chance of the residual effect to occur is between 25% and 75%.
- High – Chance of the residual effect to occur is greater than 75%.

Table 5.3-16 summarizes the likelihood ratings of a residual effect on land use occurring and provides the rationale for the rating.

Table 5.3-16 Likelihood Rating of a Residual Effect on Land Use

| Residual Effect | Likelihood Rating | Rationale for Rating |
|---|-------------------|---|
| Disturbance to residential, commercial and industrial land uses | High | Construction activities in the Project alignment will result in some disturbance to adjacent land uses, primarily due to changes in access. |
| Disturbance to recreational land uses near the new bridge | High | Construction and operation activities will result in disturbance to recreational land uses. |

5.3.5.3 Proponent’s Determination of Significance

Significance Definition

Land uses within the Project alignment are primarily determined through local government plans and regulations, in recognition of federal and provincial policies and regulations. Land use regulations are assumed to be indicative of current societal goals, because plans and regulations are updated on a regular basis in consultation with governments, businesses, and residents. Therefore, the significance of residual effects is defined in relation to the existing regulatory context. For land use, a significant adverse residual effect is considered to occur where the proposed use of land for the Project and Project-related activities:

- Is not compatible with adjacent land use activities designated through a regulatory land use process
- Will create a change or disruption that widely restricts or degrades present land uses to a point where the activities cannot continue at current levels, and for which the environmental effects are not mitigated or compensated

A residual adverse effect is considered not significant if the change does not meet either or both of the above thresholds.

Significance Determination

The residual effects associated with Project construction in terms of disturbance to other land uses are determined to be not significant because the effects do not meet either of the thresholds defined above. The rationale for this determination is presented below.

Disturbance to residential, commercial and industrial land uses

Disruption to other land uses is limited in extent to uses adjacent to or within the Project alignment and does not result in restrictions throughout the Project alignment. The duration of effects will be linked to the construction schedule, resulting in short term disruptions during construction of various Project components. The effects will be reversible once construction is completed.

The magnitude of disturbance to other land uses will likely be low for a number of reasons. A small number of land-based users may have to use alternative access routes or plan their travel around road closures for short periods of time when construction is occurring nearby. Similarly, marine users in Deas Slough and Fraser River South Arm may experience changes in schedule for shore based and water access through these areas during the construction phase.

Disturbance to recreational uses near the new bridge

The majority of the recreation use areas in the vicinity of the decommissioned Tunnel and new bridge will continue to be available during construction, and full use will be returned during operation. Other recreation areas are available nearby, so trail users have the option of using available facilities or recreating elsewhere during the times that access is limited due to construction activities. Shore-based recreational facilities at Deas Island Regional Park with access to Deas Slough will be affected by the Project due to potential delays to egress/ingress when construction activities are occurring nearby. During operation, shadow, noise and visual residual effects will be perceptible, however are not anticipated to change the level of recreational activities.

The significance and likelihood of significant adverse residual effects to land use are presented in **Table 5.3-17**. The determination of the residual effects being not significant is considered likely because the mitigation measures have been used during construction of similar projects in the Metro Vancouver region over the past 15 years.

Table 5.3-17 Summary of Determination of Significance of Residual Effects for Land Use

| Residual Effect | Significance (significant/not significant) | Likelihood (low/moderate/high) |
|--|--|--------------------------------|
| Residual Effect #1: Disturbance to other land uses during construction | Not significant | High |
| Residual Effect #2: Disturbance to recreational uses during construction and operation | Not significant | High |

5.3.5.4 Confidence and Risk

Prediction of confidence was based on expert judgment and characterizes the level of uncertainty associated with both the significance and likelihood determinations. The level of confidence is based on scientific information, statistical analysis, professional judgment of the discipline expert, effectiveness of mitigation, and assumptions made.

Low, moderate, or high confidence reflects the level of uncertainty associated with determinations of likelihood and significance.

The level of confidence in the effects predictions, associated with both the significance determination and the likelihood, is high, based on the level of certainty associated with the significance and likelihood determinations.

Given the high confidence level in the effects prediction and the anticipated not significant residual effects, risk is determined to be low and risk analysis is not required (see **Section 3.9 Confidence and Risk**).

5.3.6 Cumulative Effects and their Significance

This section describes the assessment of potential total cumulative effects of the Project on land use. The combination of the residual Project effects with the effects of all other certain and reasonably foreseeable projects and activities that will be carried out comprise the total future cumulative effects. Because the existing conditions (**Section 5.3.2**) take into account the effects of other past and present projects, this cumulative effects assessment considers only certain and reasonably foreseeable future projects.

The assessed Project-related residual effects that have been excluded from the cumulative effects assessment, along with a rationale for their exclusion are listed in **Table 5.3-18**.

Table 5.3-18 Residual Effects Excluded from the Cumulative Effects Assessment

| Residual Effect | Rationale for Exclusion |
|---|--|
| Disturbance to other land uses during construction | Residual effects will be of low magnitude, short term, and reversible once construction is completed (Table 5.3-13), and are therefore considered not likely to interact cumulatively with other projects and activities. |
| Disturbance to recreational land uses during construction | Residual effects will be of low magnitude, short term, and reversible once construction is completed (Table 5.3-14) and are therefore considered not likely to interact cumulatively with other projects and activities. |

Disturbance to recreational land uses in the vicinity of the new bridge during operation is carried forward, as the residual effects are long term and continuous.

The effects of other projects and activities that have been carried out, as well as the effects of other projects and activities that will have been carried out prior to the Project’s construction, were considered in **Section 5.3.2**, and are therefore integrated into the Project residual effects described in the preceding section. Consequently, this section examines only the potential for interactions between the adverse residual effects of the Project and the incremental effects of other future projects and activities that are certain and reasonably foreseeable.

The transmission line that currently traverses Deas Island within the Ministry’s ROW will be relocated. The Ministry is liaising with BC Hydro regarding the location of the new line. However, it is anticipated that the transmission line will continue to be within the ROW on Deas Island, and therefore, is not considered to result in adverse residual effects on land that would interact cumulatively with the Project. The Marina Gardens residential development project, to the east of the highway alignment, will continue to support the Millennium Trail and provide other park facilities, and therefore is also not anticipated to interact adversely and cumulatively with the Project. No other projects or activities were identified that would interact cumulatively with the residual effects to recreational uses in Deas Park and vicinity during operation. A cumulative effects assessment is therefore not required.

5.3.7 Follow-up Strategy

For land use, follow up strategies that have been identified to support the assessment of other VCs and ICs will indirectly support follow up with respect to potential effects on land use. Strategies identified for other VCs and ICs that will support follow-up actions related to land use include:

Section 4.9 Air Quality: Air Quality and Dust Control Management Plan and BMPs as identified in **Section 4.9.4.2** will be developed and implemented to ensure potential construction-related effects on air quality are managed. Regular monitoring and analysis will be conducted during construction to confirm applicable air quality objectives are achieved.

Section 4.10 Noise: Once the Project is completed and traffic patterns have stabilized (no more than a year after completion), post-project, 24-hour noise monitoring will be carried out at selected, representative noise receiver locations. Such monitoring will serve to both confirm noise predictions and to assess the effectiveness of mitigation measures.

Section 5.1 Traffic: During construction, the TCMP will include traffic monitoring to ensure prescribed levels of service for travellers are maintained. Quality Control and auditing processes will be implemented to measure performance, ensure compliance, and identify any areas for improvement. The development and implementation of the CTMP will be supported by ongoing engagement with key stakeholders including Ministry Operations, the contractor, municipalities, schools, emergency responders, and special traffic generators and act as a follow up strategy for traffic related considerations during construction.

During operation, traffic monitoring for the Project will follow the same processes as other major highways in the Lower Mainland. In addition, specific monitoring of travel times, traffic incidents, transit, cycling and pedestrian usage, and goods movement surveys will be carried out to verify the Project performance objectives related to traffic.

Section 5.2 Marine Use: Project-related effects are anticipated to be limited to construction activities. During construction, monitoring will include assessment of the implementation and effectiveness of the mitigation applied, including compliance with the Notice of Works and the MAMP. The development and implementation of the MAMP will be supported by ongoing engagement with key stakeholders including the contractor, municipalities, marine users and Aboriginal Groups, and act as a follow up strategy for marine use related considerations during construction.

Section 5.5 Visual Quality: The mitigation proposed to address effects on visual quality focuses on the establishment of vegetation adjacent to the bridge abutments that are within the viewscape of nearby residential developments. As the establishment of vegetated buffers is a best management practice that has been applied effectively in similar projects, a follow up strategy is not proposed.

In addition to VC- and IC-specific follow-up strategies that relate to land use, and recognizing the interrelated potential effects related to recreational land use at Deas Island Regional Park, future stages of Project development will be supported by follow up with Metro Vancouver in order to address considerations such as: access across the highway right of way during construction, reconnecting shoreline trails on Deas Island, and habitat restoration associated with the existing right-of-way on Deas Island Regional Park following Tunnel decommissioning.

APPENDIX A

Shadow Simulation Methods

Study Overview

Project-related changes will result in shadows where there are currently none. Shading can be important for some adjacent land uses because the users or occupants of land have expectations for direct sunlight and warmth from the sun. Such land uses are termed shadow-sensitive, because sunlight is important to function, physical comfort, and commerce. Land uses that are considered shadow-sensitive include residential, primarily outdoor or routinely used outdoor spaces associated with recreational (e.g., open parks), institutional (e.g., schools), or outdoor commercial (agriculture and outdoor dining). The study examined whether the shadow of the new bridge would cast on shadow sensitive land uses, where currently there are no infrastructure shadows. The study objective was to identify change in shadow cast on shadow-sensitive receptors relative to baseline conditions.

Shadow Study Area

The shadow study area is the maximum extent of the area that could be in shadow at some point due to operation of the new bridge. This area was defined from the shadow modeling outputs and is discussed in the section below on characterization of shadow.

Methods

Shadow analysis was completed for two periods of the year to understand the extent of shadow effects at times when users would be most affected. Shadows are cast in a clockwise direction from west/northwest to east/northeast from approximately 7:00 a.m. to 4:00 p.m. or later, depending on the time of the year. The shortest shadows are cast during the summer solstice (June 21), with shadows growing increasingly longer until the peak at winter solstice (December 21). For this assessment, the shadow cast by the new bridge was modelled at winter and summer solstice since these dates represent the full range of shadow lengths on sensitive land uses (e.g., residents, outdoor diners, and farmers).

AutoCAD was used to model the shadow cast at 9:00 a.m., 12:00 p.m., and 3:00 p.m. for winter solstice and at 7:00 a.m., 12:00 p.m., and 7:00 p.m. for summer solstice. The inputs to the model were a three-dimensional (3D) rendering of the new bridge deck, the date and time, and the spatial location of the bridge (longitude and latitude). The times for the model were selected based on the time of sunrise and sunset, and the times when people would be most affected by shadowing. The model also takes into account daylight savings. The spatial extent of shadow at those times was determined. This study is conservative, assuming no shading from other infrastructure or trees, and assuming no cloud cover – all of which would reduce the shadow effect of the new bridge.

Results

Characterization of Shadow

Areas of Delta and Richmond will experience changes in shadow from the new bridge. The shadow renderings are provided in **Figures 1** and **2**. A description of the areas influenced by shadow is presented in **Table 1**.

Table 1 Area Influenced by the Shadow of the New Bridge

| Time | General Description of Shadow | Area Influenced by Shadow | |
|----------------------------------|---|---|---|
| | | Delta | Richmond |
| June 21 (Summer Solstice) | | | |
| 7 a.m. | ≠ Shadow is cast west of the bridge | <ul style="list-style-type: none"> ≠ Cast over approximately 100 m of the Millennium Trail ≠ Cast over the two marina dock fingers furthest east at Captain's Cover Marina ≠ Cast over a small portion of the western end of Deas Island Regional Park | <ul style="list-style-type: none"> ≠ Cast over the mostly industrial area west of the bridge. This area appears to consist of light industrial and commercial activities, including a car dealership. ≠ Adjacent to the Fraser River, shadow is cast in an industrial area that appears to be used for BC Ferries maintenance activities. |
| 12 p.m. | ≠ Shadow is cast directly under the bridge deck | ≠ Cast directly under the bridge deck | ≠ Cast directly under the bridge deck |
| 7 p.m. | ≠ Shadow is cast east of the bridge | <ul style="list-style-type: none"> ≠ A small portion of the shadow is cast on the western edge of the Riverwoods at River Road housing development. ≠ Cast over the middle of Deas Island Regional Park | <ul style="list-style-type: none"> ≠ Cast over the agricultural area east of the bridge ≠ Adjacent to the Fraser River, shadow is cast over an industrial area. |

| Time | General Description of Shadow | Area Influenced by Shadow | |
|--------------------------------------|---|---|--|
| | | Delta | Richmond |
| December 21 (Winter Solstice) | | | |
| 9 a.m. | ≠ Majority of the shadow is cast directly under the bridge deck while the remainder is cast slightly west of the bridge | <ul style="list-style-type: none"> ≠ Cast over less than approximately 50 m of the Millennium Trail ≠ A small shadow is cast over the western end of Deas Island Regional Park. | ≠ A small shadow is cast over the mostly industrial area west of the bridge. This area appears to consist of light industrial and commercial activities, including a car dealership. |
| 12 p.m. | ≠ Shadow is cast east of the bridge | <ul style="list-style-type: none"> ≠ A small portion of the shadow is cast on the western edge of the Riverwoods at River Road housing development. ≠ Cast over the middle of Deas Island Regional Park | <ul style="list-style-type: none"> ≠ Cast over the agricultural area east of the bridge ≠ Adjacent to the Fraser River, shadow is cast on an industrial area east of the bridge. |
| 3 p.m. | ≠ Shadow is large and is cast east of the bridge | <ul style="list-style-type: none"> ≠ Cast over majority of the Riverwoods at River Road housing development ≠ Cast over the middle of Deas Island Regional Park | <ul style="list-style-type: none"> ≠ Shadow from the bridge deck and the piers is cast over the agricultural area east of the bridge. ≠ Adjacent to the Fraser River, shadow is cast on an industrial area east of the bridge. |

Overview of Potential Project Interactions with Land Use

Table 1 Overview of Potential Project Interactions with Land Use

| Project Phase / Component | Interaction Ranking | Project Works and Activities that Interact with the VC | Nature of Potential Interaction |
|--|---------------------|---|--|
| Pre-Construction / Site Preparation | | | |
| Pre-construction / site preparation | No interaction | <ul style="list-style-type: none"> • Surveying | <p>Nature of interaction: No interaction anticipated.</p> <p>Rationale: Because the Project Area is within an existing highway corridor, it is considered consistent with plan designations</p> |
| | No effect | <ul style="list-style-type: none"> • Clearing and grubbing of vegetation within the existing Highway 99 ROW • Restoration of Green Slough to its historic alignment • Installing temporary drainage structures and diversions • Installing temporary bridges and barging facilities • Conducting additional site investigations (i.e., a geotechnical drilling program) • Installing temporary roads, laydown areas, and site offices • Relocating utilities • Preloading for embankment and highway construction | <p>Nature of interaction: Activities with the potential to cause temporary, short-term disturbance to adjacent land uses.</p> <p>Rationale: All potential disturbances to adjacent land uses can be effectively addressed through proven best practices informed by the Ministry’s experience with previous projects of comparable nature and magnitude.</p> |
| | Potential effect | <ul style="list-style-type: none"> • Acquiring property for the Project | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> • Changes to the compatibility of the Project alignment with adjacent land uses • Changes to the area of existing land uses |

| Project Phase / Component | Interaction Ranking | Project Works and Activities that Interact with the VC | Nature of Potential Interaction |
|--|---------------------|---|---|
| Construction | | | |
| | No interaction | N/A | N/A |
| | No effect | N/A | N/A |
| New Bridge including approaches and ramp connections | Potential effect | <ul style="list-style-type: none"> • Installing upland piers, including pile installation • Installing drainage structures/settling ponds • Installing retaining walls • Hoisting pre-assembled deck segments from barges in the river or land-based transport system • Constructing approach spans (concrete deck slab on steel or concrete girder) • Installing piers adjacent to Deas Slough and Green Slough, including pile installation | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> • Disturbance to other land uses (e.g., recreation) due to changes in access and noise during Project construction. Effects will largely be experienced near the construction sites, which are phased over time. |

| Project Phase / Component | Interaction Ranking | Project Works and Activities that Interact with the VC | Nature of Potential Interaction |
|---|---------------------|---|---|
| Highway 99 improvements, including interchange upgrades | No interaction | N/A | N/A |
| | No effect | N/A | N/A |
| | Potential effect | <ul style="list-style-type: none"> • Replacement of interchanges at Westminster Highway, Steveston Highway and Highway 17A • Replacement of over/underpasses at Cambie Road, Shell Road, Highway 91 Westbound Ramp, Blundell Road, Ladner Trunk Road and 112th Street • Highway widening from Bridgeport in Richmond to Highway 91 in Delta including construction of embankments, placing and compacting fill for road base, establishing improved drainage and paving | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> • Disturbance to other land uses due to changes in access during Project construction. Effects will largely be experienced near the construction sites, which are phased over time. |
| Tunnel decommissioning | No interaction | <ul style="list-style-type: none"> • Transporting Tunnel elements for offsite disposal, and operating support vessels for that activity | N/A |
| | No effect | N/A | N/A |
| | Potential effect | <ul style="list-style-type: none"> • Removing electrical/mechanical/utilities equipment from the Tunnel • Removing of four Tunnel segments and associated scour protection • Backfilling of onshore portions of Tunnel approaches | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> • Disturbance to other land uses (e.g., recreation) due to changes in access and noise during Project construction. Effects will largely be experienced near the construction sites, which are phased over time. |

| Project Phase / Component | Interaction Ranking | Project Works and Activities that Interact with the VC | Nature of Potential Interaction |
|---------------------------------------|---------------------|---|---|
| Decommissioning of Deas Slough Bridge | No Interaction | N/A | N/A |
| | No effect | N/A | N/A |
| | Potential effect | <ul style="list-style-type: none"> Removal of Deas Slough Bridge including substructures | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> Disturbance to other land uses (e.g., recreation) due to changes in access and noise during Project construction. Effects will largely be experienced near the construction sites, which are phased over time. |
| Operation and Maintenance | | | |
| Highway 99 and interchanges | No interaction | N/A | N/A |
| | No effect | <ul style="list-style-type: none"> Operating reconfigured Highway 99 and interchanges Highway 99 and interchange maintenance (drainage maintenance, winter maintenance, emergency maintenance, road cleaning, etc.) | <p>Nature of interaction: Activities with the potential to cause disturbance to other land uses</p> <p>Rationale: Disturbance to adjacent land uses is anticipated to be negligible because the Project is a modification of an existing highway corridor</p> |
| | Potential effect | N/A | N/A |

| Project Phase / Component | Interaction Ranking | Project Works and Activities that Interact with the VC | Nature of Potential Interaction |
|---------------------------|---------------------|---|---|
| New Bridge | No interaction | N/A | N/A |
| | No effect | <ul style="list-style-type: none"> • Bridge maintenance (winter maintenance, emergency maintenance, structure maintenance, etc.) | <p>Nature of interaction: Activities with the potential to cause disturbance to other land uses</p> <p>Rationale: Disturbance to adjacent land uses is anticipated to be negligible because the Project is a modification of an existing highway corridor</p> |
| | Potential effect | <ul style="list-style-type: none"> • Operating the new bridge | <p>Potential Project-related effects include:</p> <ul style="list-style-type: none"> • Shadowing of adjacent areas, visual and noise effects to recreational uses. • Improving trails within the Highway 99 corridor on Deas Island and along the Millennium Trail could result in moderate positive interactions. |

5.4 Agricultural Use Assessment Highlights:

- The Project has been designed to accommodate all proposed works predominantly within the Highway 99 ROW, minimizing the need for land acquisitions to the extent possible.
- The Ministry has identified suitable land parcels that will be made available for agricultural use to offset the acquisition of small portions of farmland for the Project. These parcels are located adjacent to existing farm fields and can be restored to comparable land capability, enhancing their agricultural potential.
- Project-related offsetting is expected to result in a net gain of up to 1.4 ha of land for agricultural use.
- The Project is expected to result in potential changes to the boundaries of a small number of farms. Potential effects associated with these changes will be mitigated through measures such as parcel consolidation and using elevated guideways to minimize land requirements.
- Agricultural operations along the Project alignment are expected to benefit from Project-related improvements to irrigation and drainage systems as well as increased reliability in getting agricultural goods to market.
- No significant Project-related residual or cumulative effects on agricultural use are expected.

5.4 Agricultural Use

5.4.1 Context and Boundaries

This section describes the context for assessment of Project-related effects on agricultural use in terms of Project setting, and defines the spatial, temporal, administrative and technical assessment boundaries. The rationale for selecting the assessment boundaries is also provided.

5.4.1.1 Assessment Context

Agricultural use in this assessment encompasses both on-farm activities and activities carried out by the agricultural sector to support on-farm activities. On-farm activities include but are not limited to; soil cultivation and management, nutrient management, irrigation, drainage, crop production, livestock production, and farm-gate sales of products. Off-farm activities considered in the assessment include but are not limited to; travel between farm parcels (many farm owners farm on multiple properties), transportation of inputs (e.g., fertilizer, fuel) and supplies to farms, and transportation of products to market.

Agricultural use is important to the Lower Mainland and Metro Vancouver for economic, historical, cultural, and ecological reasons. Farming has occurred in the vicinity of the Project since the 1860s, and continues to be an important economic activity that is also part of the cultural identity of the region. Agricultural land provides the base for food security, which will grow in importance as world populations increase and climates change. Agricultural land also provides a number of ecological and socio-community services including wildlife habitat (especially in winter), nutrient and organic matter recycling, carbon sequestration, aesthetics (green space), and flood management.

5.4.1.2 Methodology

The assessment of agricultural use follows the general methodology described in **Section 3.0 Assessment Methodology** and applied to all VCs. Building on this approach; the assessment of agricultural use was designed to focus on specific aspects or features considered most appropriate in the context of existing conditions in the Project area. In this context, the assessment of agricultural use focuses on three sub-components as presented in **Table 5.4-1**.

Table 5.4-1 Sub-components of Agricultural Use

| Sub-component | Representative of: | Rationale for Selection |
|---|--|--|
| Land in Agricultural Land Reserve (ALR) | Agricultural capability in local communities and the region | Land in the ALR provides the base for food production and future food security. It also provides wildlife habitat in winter and has aesthetic value (e.g., as green space). |
| Irrigation and drainage | Public (municipal) and private (farm) infrastructure that makes farming viable | Agricultural operations throughout the local assessment area depend on drainage systems in autumn, winter, and spring to manage soil wetness, but may require irrigation during the growing season to compensate for soil moisture deficits. Most farms are not economically viable without these systems. |
| Farm infrastructure and operations | Farm-specific infrastructure, crop, and animal production | Individual farms must be viable for the overall agricultural land base to meet local, regional, and provincial needs. |

The change in ALR land by capability class, change in irrigation and drainage systems, and change in farm infrastructure and operations were used as indicators to assess trends of agricultural use within the assessment area and to evaluate potential Project-related effects. **Table 5.4-2** presents the indicators chosen for the assessment of Project-related effects on the three agricultural use sub-components, and the rationale for their selection.

Table 5.4-2 Indicators for Assessment of Agricultural Use Sub-components

| Sub-Component | Indicator | Rationale for Selection |
|------------------------------------|---|--|
| Land in ALR | Change in ALR land by capability class | Loss of local and regional agricultural capability may reduce the land base available for agricultural production. |
| Irrigation and drainage | Change in irrigation and drainage systems | Impairment of municipal agricultural drainage infrastructure and changes to irrigation water quality or quantity may impact agricultural production in the local communities. |
| Farm infrastructure and operations | Change in farm operations | Changes to individual farm operations (such as loss of land, parcel fragmentation, boundary adjustments, on-farm drainage systems, or utilities), access, and travel times may influence the economic viability of a few specific farms. |

During pre-Application consultation on the Project, information on plant harvesting in and around the Project area by Aboriginal Groups, including the types of plants harvested and key harvesting locations, was communicated to the Ministry. However, there were no comments that related specifically to commercial agriculture. Most agricultural activity in the LAA occurs on privately-owned lands, including farm land owned by the Tsawwassen First Nation who has developed an agricultural plan to manage farming activity on their lands (Zbeetnoff 2013). This agricultural use assessment includes consideration of the potential for effects (direct and indirect) on those lands. Potential influence of the Project on traditional harvesting or gathering of plants and associated effects on Aboriginal Groups are discussed in **Chapter 10 Aboriginal Consultation** of this Application.

5.4.1.3 Assessment Boundaries

Spatial, temporal, administrative, and technical boundaries identified for the assessment of Project-related effects on agricultural use, and the rationale for selecting them are discussed below.

5.4.1.3.1 Spatial Boundaries

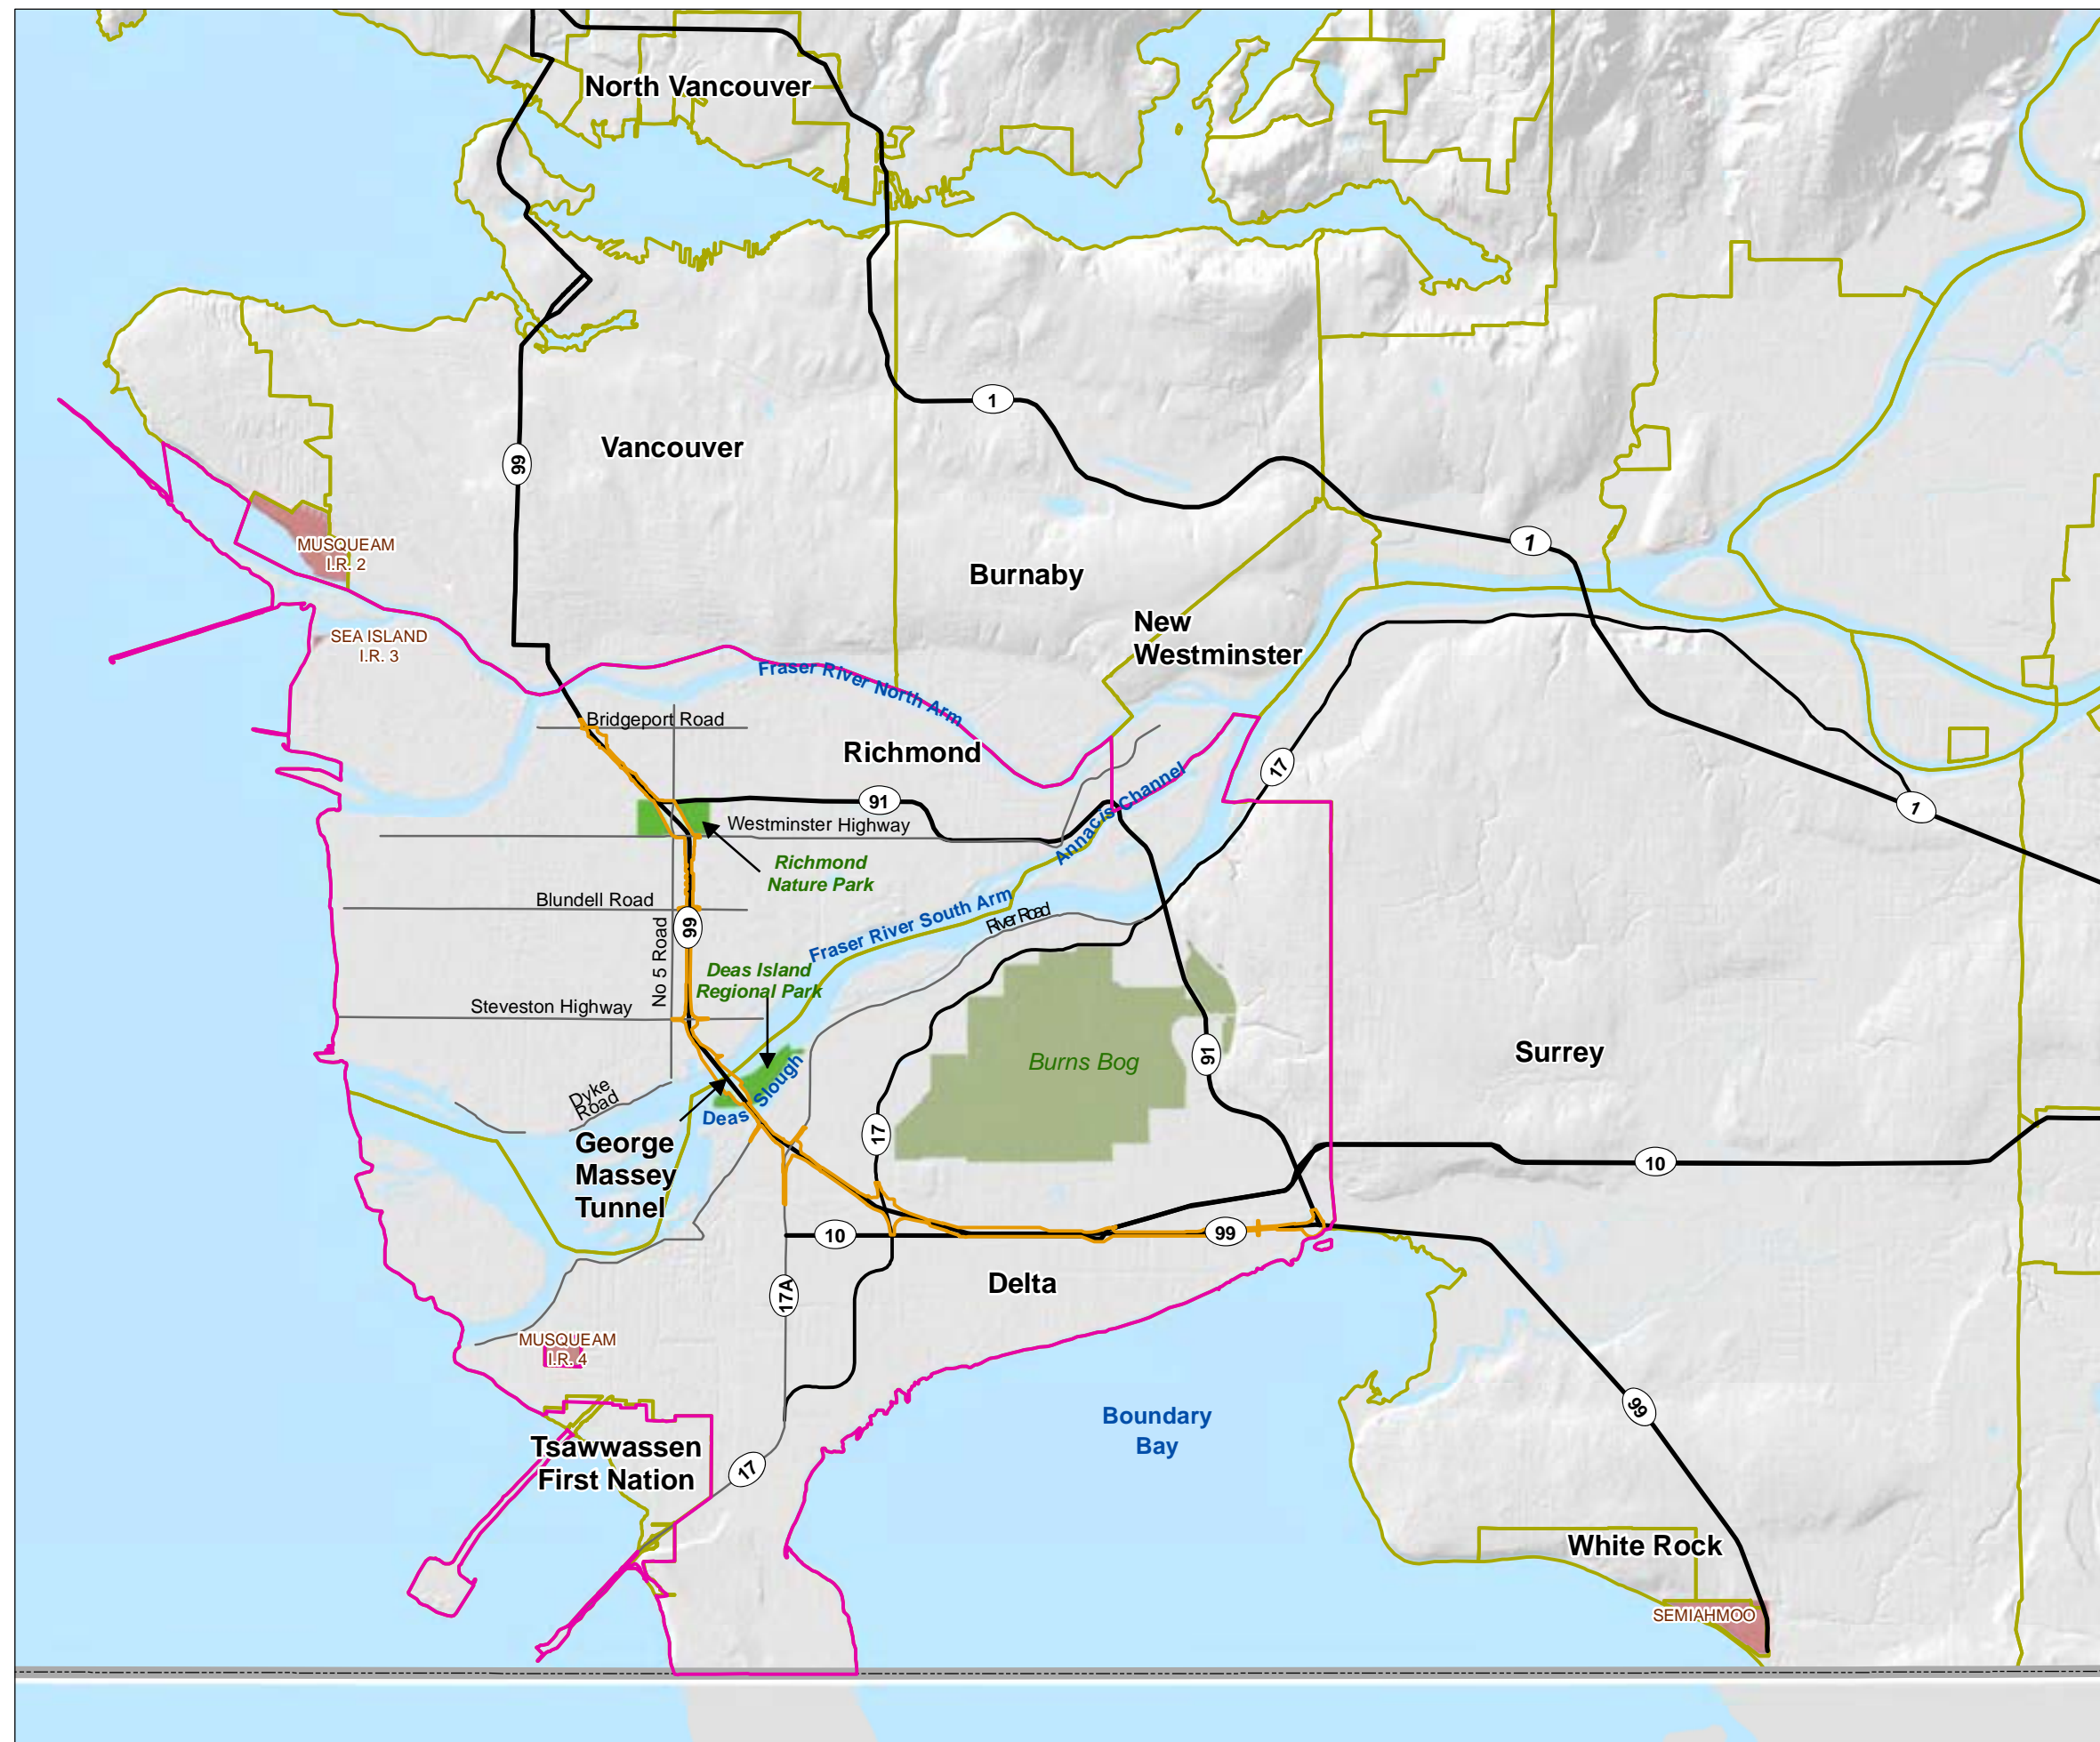

The local assessment area (LAA) and regional assessment area (RAA) are defined in **Table 5.4-3** and shown on **Figure 5.4-1**. Boundaries of the assessment area take into account the scale and spatial extent of potential environmental effects that are appropriate for the three sub-components.

Table 5.4-3 Spatial Boundary Definitions for Agricultural Use

| Spatial Boundary | Description of Assessment Area |
|---------------------------------------|--|
| Local Assessment Area (LAA) | The boundaries of the City of Richmond (Richmond), Corporation of Delta (Delta), and the City of Surrey (Surrey) |
| Regional Assessment Area (RAA) | The boundary of Metro Vancouver |

The LAA was established to encompass the area within which the Project is expected to interact with, and potentially have an effect on, agricultural use. To consider the maximum extent of potential indirect interactions, the LAA includes the municipalities described in **Table 5.4-3** above. In determining LAA boundaries, consideration was given to the nature and characteristics of agricultural use, its potential exposure to various influences, and the maximum extent of potential Project-related influence on agricultural use. The LAA was defined as those municipalities that could be influenced directly (i.e., through overlap with Project components) or indirectly (i.e., through potential effects on drainage/irrigation and transportation) by the Project. The Project is located within the municipal boundaries of Richmond and Delta, and has the potential to affect agricultural use in these municipalities both directly and indirectly. Given that all Project components are located outside of its municipal boundaries, no direct Project-related effects on agricultural use are expected in Surrey. The potential for the Project to influence agricultural use in Surrey indirectly through changes in transportation or irrigation/drainage was considered, and it was determined that, given the extent of the Project alignment relative to municipal boundaries, such influences would be negligible. Surrey is therefore discussed in the regional context in this assessment.

The RAA was established to provide a regional context for the assessment of Project effects, and is consistent with the planning boundaries for the Regional Food System Strategy (Metro Vancouver 2011) which establishes the framework for agricultural land use planning in the region. An agricultural “footprint” was identified that consists of ALR land within the portion of the Project alignment that extends beyond the boundaries of the existing Highway 99 right-of-way (ROW). This area with direct effects on agricultural land consists of narrow segments of land along Highway 99 between Blundell Road and Steveston Highway, and Deas Slough and Highway 17 (see **Figure 5.4-1** and **Appendix A, Figures 1a – 1aa**).

| | |

5.4.1.3.2 Temporal Boundaries

Temporal boundaries for the assessment of Project-related effects on agricultural use were established based on the potential for each phase of the Project to interact with and have an effect on agricultural use. As discussed in **Section 3.1 Issues Scoping and Selection of Valued Components**, both the construction and operational phases of the Project include components and activities that could interact with and affect agricultural use present within the Project alignment; therefore, the following temporal boundaries were defined for the agricultural use assessment:

- Existing conditions
- Project construction (including Tunnel decommissioning)
- Project operation (including maintenance)

Temporal characteristics of the Project phases are discussed in **Section 1.1 Description of Proposed Project**. Specific temporal considerations for the assessment of agricultural use and its sub-components (e.g., planting and harvest seasons; land, water and nutrient management in winter) are discussed in the context of Project interactions and potential effects in **Section 5.4.3 Potential Effects**.

5.4.1.3.3 Administrative Boundaries

The boundaries of both the LAA and the RAA are defined by municipal/regional administrative boundaries because those boundaries provide the planning and socio-economic contexts for the effects assessment. The LAA is defined by the boundaries of municipalities that could potentially be affected by the Project. The RAA is defined by the boundaries of Metro Vancouver.

5.4.1.3.4 Technical Boundaries

Technical boundaries refer to the constraints imposed on an environmental assessment by limitations in the ability to predict the effects of a project. There are no technical boundaries directly applicable to the assessment of agricultural use as a VC. However, some aspects of the agricultural use assessment rely on technical work completed for other VCs; specifically the modelling used to predict changes in the Fraser River salt wedge, ambient noise conditions, and air quality.

5.4.1.3.5 Trends in Agricultural Land Use

Recent and projected future population growth and economic development in the Lower Mainland suggest a potential trend of continuing pressure on the ALR within the RAA. In recent years, projects such as the South Fraser Perimeter Road (SFPR) and the exclusion of former ALR lands related to the Tsawwassen First Nation Lands, as defined by the *Tsawwassen First Nation Final Agreement* (2007), lands have contributed to the loss of agricultural land, particularly in Delta. In the case of the SFPR, the effects were offset in part through substantive improvements to the drainage and irrigation systems in Delta (i.e., the Delta Irrigation Enhancement Project). Local governments in the LAA and RAA remain committed to agricultural land preservation and support for farming.

There is also a trend among consumers towards improved understanding of the value of agricultural land for food production and for a range of other benefits such as green space, aesthetics, wildlife habitat, local employment, stormwater retention, and greenhouse gas (CO₂) uptake. The 2013-2016 drought in California, combined with the recent change in value of the Canadian dollar compared to the U.S. dollar, has contributed to this increase in awareness of the importance of local agriculture and its role in food security.

5.4.2 Existing Conditions

This section provides an overview of the methodology used in collecting baseline data, and describes the existing conditions of agricultural use within the assessment area. An overview of the regulatory context that is relevant to agricultural use is also provided.

5.4.2.1 Baseline Data Collection

In 2014, the Ministry initiated studies on agricultural use to support Project planning and assessment. Building on available information, these studies were designed to address known data gaps, as summarized in **Table 5.4-4**.

Table 5.4-4 Agricultural Use Desktop and Field Studies

| Study Name | Purpose of Study |
|-------------------------------------|---|
| Desktop Review | <ul style="list-style-type: none"> • Provide the agricultural context and baseline conditions within the study areas through a review of existing background information including reports, maps, aerial photographs, and data files. |
| Preliminary Stakeholder Meetings | <ul style="list-style-type: none"> • Meet with stakeholders to discuss potential effects of the Project at a local and regional scale, and understand community concerns. |
| Mapping and Spatial Analysis | <ul style="list-style-type: none"> • Overlay Project components with ALR boundary maps to determine the potential direct effects on individual farm properties and operations. |
| Field Studies and Farmer Interviews | <ul style="list-style-type: none"> • Gain an understanding of land use and the transportation network in the LAA and RAA. • Assess potential direct and indirect effects of the Project on individual farm operations and fields. Site visits focused on farm fields with the potential for direct Project-related effects. |

These studies are described in further detail below.

5.4.2.1.1 Desktop Review

To initiate the agricultural use assessment, existing background information relevant to the Project was assembled and reviewed from sources including the following:

- Orthophoto and topographic maps
- Published soil maps and reports
- Agricultural land and climate capability maps
- ALR boundary maps
- Agricultural area plans and Official Community Plans (OCP) for Richmond and Delta
- Drainage and irrigation studies
- Agricultural commodity profiles
- Agricultural Census of Canada statistics

5.4.2.1.2 Preliminary Stakeholder Meetings

To augment the information review, stakeholder meetings were held to review the Project and discuss potential effects of the Project at a local and regional scale. These included meetings between the Ministry and representatives of the B.C. Ministry of Agriculture, the B.C. Agricultural Land Commission (ALC), the Richmond and Delta Farmers' Institutes, and municipalities of Richmond and Delta.

During preliminary meetings, members of the Farmers' Institutes outlined current challenges related to agricultural infrastructure in the region and posed general questions about the Project, based on the high-level design concepts available at the time. These preliminary meetings were followed by field visits and interviews with a number of farm owners or operators to verify existing soils and agricultural capability/use information and to gain a better understanding of potential Project-related effects on individual farm properties.

5.4.2.1.3 Mapping and Spatial Analysis

The ALR parcels along the Highway 99 corridor that could potentially be directly or permanently affected, or both, were identified by overlaying the ALR boundaries and the Project components on an orthophoto base with cadastral (legal property boundary) information. The Project components included the road prism out to the edge of fill slopes (as indicated by the orange-shaded areas in the maps included in **Appendix A**). The map was also overlain with existing soils and agricultural capability and use information. This mapping was used to help determine potential direct Project-related effects on individual farm properties and operations.

5.4.2.1.4 Field Studies and Farmer Interviews

A preliminary field survey was conducted along the Highway 99 corridor to verify land use in the context of the LAA and RAA. More detailed field assessments and owner/operator interviews were conducted in areas with potential for direct footprint effects.

5.4.2.1.5 Quality and Reliability of Information on Existing Conditions

Most of the published information used for the agricultural use assessment is of sufficient quality to enable the evaluation of potential adverse effects on the first two sub-components – land in the ALR, and drainage and irrigation. The LAA is located in one of the most important agricultural regions in B.C. and, as a result, there is a robust database of information on soils, crops, and water management within this area. For the assessment of effects on specific farm operations, the level of reliability is good for the majority of farm parcels where effects are limited to small adjustments in the Highway 99 ROW. For parcels where the potential effects are

more complex, the reliability is good in the cases where visits to the site with the farm owner or operator were possible and somewhat less reliable where the evaluation was based on site reconnaissance only.

5.4.2.2 Regulatory Context

Responsibility for agriculture in Canada is shared by the federal and provincial governments, and there is a high level of inter-governmental cooperation. The federal government regulates agricultural imports and exports, carries out research, and supports a number of federal-provincial programs, but does not regulate land use. The B.C. government regulates many of the individual producer sectors in the province, and is responsible for land use through the B.C. ALC, an independent provincial agency. Local governments have a role in agricultural use through zoning and other planning tools. Regulation and management of agricultural use in the region surrounding the Project Area occurs primarily through the following provincial legislation:

- *Agricultural Land Commission Act*, SBC 2002, c. 36
- Agricultural Land Reserve Use, Subdivision and Procedure Regulation, B.C. Reg. 171/2002
- *Agricultural Land Commission Amendment Act*, 2014, Bill 24 – 2014
- *Farm Practices Protection (Right to Farm) Act*, R.S.B.C. 1996, c. 131
- *Environmental Management Act*, S.B.C. 2003 c. 53 Agricultural Waste Control Regulation B.C. Reg. 131/92 (including January 2015 amendments)

The *Agricultural Land Commission Act* sets the legislative framework for the establishment and administration of the agricultural land preservation program. This legislation takes precedence over but does not replace other legislation and bylaws that may apply to the land. The ALR is provincially designated land on which agriculture is recognized as the priority use and is encouraged, and on which other land uses are controlled (ALC 2004). The ALR is administered in favour of agriculture by the ALC. The *Agricultural Land Commission Act*, its 2014 amendment, and Regulation 171/2002 specify the regulatory requirements that will need to be satisfied for the Project to move forward. Specifically, authorization from the ALC must be obtained for the following transportation, utility, or recreational works within the ALR:

- Widening of an existing road ROW
- Construction of a road within an existing ROW
- Dedication of a ROW or construction of any of the following:
 - A new or existing road or railway
 - A new or existing recreational trail

- A utility corridor use
- A sewer or water line other than for ancillary utility connections
- A forest service road under the *Forest Act*, RSBC 1996, c. 157
- The new use of an existing ROW for a recreational trail

Local and regional governments, as well as other provincial agencies, are expected to plan in accordance with the provincial policy of preserving agricultural land. In general, the policies and bylaws of the two municipalities in which the Project is located (Richmond and Delta), and Metro Vancouver support and promote agricultural use in the ALR. The ALC obtains the comments and recommendations of local governments for all applications for transportation use in the ALR.

The *Farm Practices Protection Act* (FPPA) provides protection of normal farm practices from nuisance suits (e.g., related to noise from air canons or bird detractor and odour from dairy farms). It only applies to land within the ALR. The FPPA is not expected to be relevant to the Project as nuisance suits are normally confined to the rural/residential interface.

The *Agricultural Waste Control Regulation* (AWCR) describes environmentally sound practices for using, storing and managing wastes, such as manure, and by-products (composted materials) or other materials used in agriculture (wood waste). The AWCR is not relevant to the Project as there are no dairy, swine or poultry producers, or compost facilities that will be directly impacted by the Project

5.4.2.3 Existing Conditions

This section describes the existing conditions of agricultural use, as well as the surrounding environment and factors influencing agricultural use, organized according to the three sub-components identified in **Table 5.4-1**. The biophysical conditions (i.e., soils and agricultural capability) are described only for the areas overlapping the Project components, since the Project will not affect the biophysical conditions of the LAA or RAA outside of these limits. The existing socio-economic conditions are described for the LAA and RAA. The Highway 99 corridor through the RAA is bordered on one, or both sides, by the ALR along 26.6 km, or 66% of its 40-km length.

5.4.2.3.1 Land in ALR

Land Areas currently in the ALR

Based on the BC Ministry of Agriculture’s (2014) land use inventory, there were 4,756 ha of land in the ALR within the City of Richmond as of 2011. Of this, 2,797 ha (59%) was being farmed, 1,032 ha (22%) was anthropogenic/not farmed, and 927 ha (19%) was in a natural or semi-natural state. Within Delta, 6,691 ha (76%) of the ALR was farmed out of a total of 8,843 ha, with 996 ha (11%) anthropogenic/not farmed and 1,155 ha (13%) natural or semi-natural. A further 164 ha of ALR was on Tsawwassen First Nation lands. Since 2011 there have been relatively few inclusions or exclusions of ALR land in the LAA. The 2011-2012 to 2014-2015 annual reports produced by the ALC indicate a net increase of 63 ha to the ALR in the South Coast Region¹ over that time period (ALC 2016).

Soils

Although a variety of soil types exist in the Project footprint, the surficial materials are primarily medium-textured deltaic deposits with poor drainage and saline phases (**Table 5.4-5**; Luttmending 1981). Deltaic sediments have been deposited by the Fraser River since the end of the Fraser Glaciation (about 10,500 years before present), after sea levels stabilized at near their current levels (Luttmending 1981). The most common soils along the Richmond section of the Project alignment are Richmond, Delta, Westham, and Crescent soil. In the Delta section of the Project alignment, the most common soils are the Westham and Crescent soil series. Spetifore, Blundell, and Tsawwassen soils also occupy small areas of the footprint (indicated by purple polygons in **Appendix A, Maps A1 to A13**). Soil types in the Project footprint are described in **Table 5.4-5**; the corresponding Soil Management Groups (outlining agricultural limitations, required inputs, and suitable crops of the soil types) are described in **Table 5.4-6**.

¹ The South Coast Region includes Metro Vancouver plus the Sunshine Coast, Fraser Valley, and part of the Squamish-Lillooet Regional Districts.

Table 5.4-5 Soil Types in the Project Footprint and Adjacent Areas

| Soil Name and Map Symbol | Soil Parent Material | Drainage | Classification Code * | Soil Management Group ** |
|--------------------------|---|---|-----------------------|--------------------------|
| Blundell Soils (BU) | medium-texture deltaic deposits | poorly drained; very high water table | R.Gs | Blundell |
| Crescent (CT) | medium-texture deltaic deposits | mod. poor or imperfect; high water table | O.G | Crescent |
| Delta (DT) | medium-texture deltaic deposits | very poor; high water table | O. HG | Delta |
| Richmond (RC) | >160 cm of partially decomposed org matter | very poor; very high water table | T. H | Lumbum |
| Spetifore Soil (SF) | saline deltaic deposits >1m on sand | poor to very poor; water table at or near surface | R. HGs | Spetifore |
| Tsawwassen (TS) | coarse textured (sandy) Fraser River deposits | well to mod. well; medium water table | O.G. | Grevell |
| Westham (WS) | medium-texture deltaic deposits | poor; high water table | R. HG | Delta |

Codes: R.Gs Rego Gleysol (saline phase) O.G. Orthic Gleysol; O.HGs Orthic Humic Gleysol (saline phase); T.H Typic Humisol; R.HGs Rego Humic Gleysol (saline phase); O.R Orthic Humisol; R.HG Rego Humic Gleysol.

**See Table 5.4-6 for information on management practices and suitable crops for these groups.

Land Capability for Agriculture

As noted above, agricultural capability in B.C. is rated through the Land Capability Classification for Agriculture in British Columbia (B.C. MOE and B.C. MOAF 1983). The system ranks soils into seven land capability classes (Class 1 to Class 7), the highest classification (Class 1) has no or only very slight limitations for agriculture; the lowest (Class 7) has no capability for soil-bound agriculture. **Table 5.4-7** summarizes the descriptions for each class. In most agricultural regions of B.C., two ratings are assigned to a soil unit: the first (unimproved rating) to reflect the natural soil, drainage, and terrain properties, and the second (improved rating) reflects the soil capability after implementation of management improvements to offset limitations (ALC 2013). Improvements typically implemented in B.C. include drainage systems, irrigation, stone picking, and soil amendments.

The system also ranks Class 2 to Class 7 soils into capability subclasses based on the types of limitations. **Table 5.4-8** lists the limitations that are commonly found in the RAA along with the improvement measures that are typically taken.

For the RAA, two capability ratings are shown on the published agricultural capability mapping: an unimproved or natural rating, and an improved rating to reflect changes to capability after management improvements are implemented (ALC 2004). Improvements include drainage system, irrigation systems, or both, stone picking, and soil amendments such as the addition of organic matter, lime, or fertilizer. The improved land capability rating is the appropriate indicator of land quality because drainage and other improvements have been widely implemented throughout the RAA, where soils are primarily limited by a high water table. The improved (drained/irrigated) agricultural capabilities within the areas overlapping Project components and adjacent areas are primarily Class 2, with some Class 1 and Class 3 soils.

Maps A1 to A13 (**Appendix A**) show the land capability ratings for the soil polygons that are present adjacent to the Highway 99 alignment.

Table 5.4-7 Land Capability Classes for Agriculture

| Class | Description |
|----------------|---|
| Class 1 | Land either has no or only very slight limitations that restrict its use for the production of common agricultural crops. |
| Class 2 | Land has minor limitations that require good ongoing management practices or slightly restrict the range of crops, or both. |
| Class 3 | Land has limitations that require moderately intensive management practices or moderately restrict the range of crops, or both. |
| Class 4 | Land has limitations that require special management practices or severely restrict the range of crops, or both. |
| Class 5 | Land has limitations that restrict its capability to producing perennial forage crops or other specially adapted crops. |
| Class 6 | Land is non-arable but is capable of producing native and/or uncultivated perennial forage crops. |
| Class 7 | Land in this class has no capability for arable or sustained natural grazing. |

Note: Adapted from ALC (2013).

Table 5.4-8 Limitations to Agriculture and Associated Improvements

| Symbol | Limitation | Common Improvements |
|----------|--|---|
| W | Excess water | Drainage systems |
| L | Permeability (organic soils) | Cannot be improved |
| D | Undesirable soil structure | Organic matter additions |
| N | Salinity | Difficult to improve. Improvement by drainage with regular flushing with non-saline irrigation water possible in some situations. |
| I | Inundation (by flooding) | Diking |
| A | Soil moisture deficiency | Irrigation |
| P | Stoniness | Stone picking |
| F | Fertility | Fertilizer additions |
| T | Topography | Cannot be improved (except in exceptional circumstances) |
| R | Shallow depth to bedrock or bedrock outcrops | Cannot be improved |

Note: Adapted from ALC (2013).

5.4.2.3.2 Irrigation and Drainage

Climate Capability and Climatic Moisture Deficits

Richmond and Delta receive relatively high rainfall in late autumn and winter, but experience a moisture deficit in the summer (**Figure 5.4-2**). Thus, many agricultural fields require drainage and irrigation improvements to maintain favourable soil moisture conditions during crop production. Climatic moisture deficits (CMD) are calculated using precipitation data and the estimated potential evapotranspiration².

Independent of Land Capability for Agriculture, as described above, the agricultural capability of an area is also classified based on the local climate using the Climate Capability Classification for Agriculture in B.C. (B.C. MOE 1981). This system ranks climate capability into seven classes based on the number of frost free days, growing degree days, and CMD or climate moisture surplus (CMS); the highest classification (Class 1) is associated with a wide range of crops; the lowest (Class 7) has no potential for agriculture.

The general climate capability for agriculture in the LAA is Class 1 for thermal characteristics, but mainly Class 3A for CMD (the “A” denotes aridity due to CMD). The CMD can generally be overcome by supplemental irrigation which improves the capability rating to Class 1 for soils with sandy loam or finer textures (B.C. MOE 1981, B.C. MOE and B.C. MOAF 1983). More information on agricultural capability in the LAA is provided in the Soils and Agricultural Land Capability section above.

² Evapotranspiration is the ability of the atmosphere to remove water from the surface through processes of evaporation and transpiration.

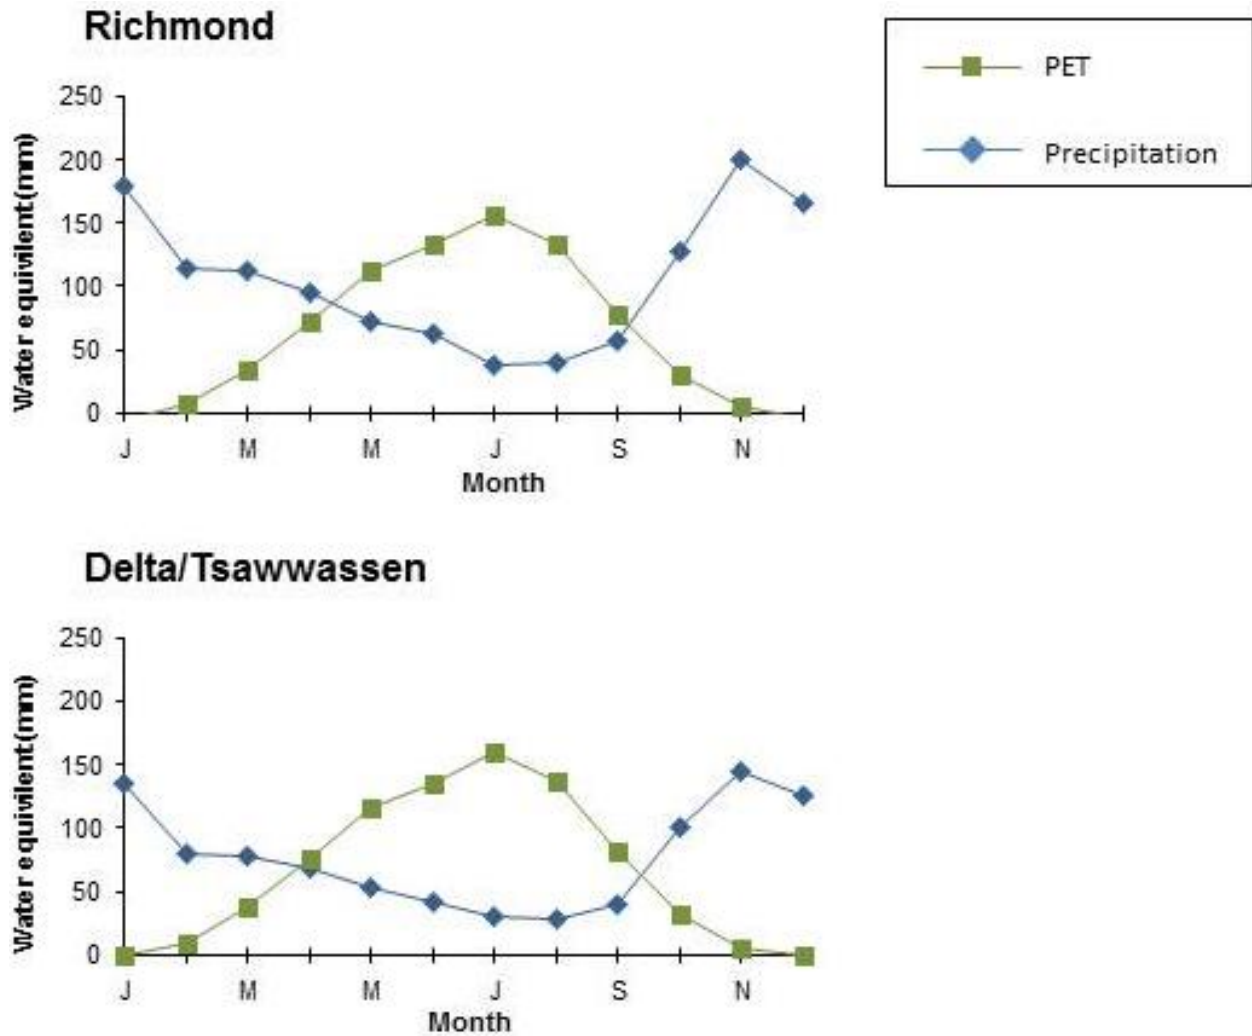

Figure 5.4-2 Monthly Normal Precipitation and Potential Evapotranspiration (PET) in Richmond and Delta

Drainage and Irrigation Infrastructure and Water Quality

Adequate drainage is a major problem for all lowland agricultural areas of the RAA. High or perched groundwater tables (saturated soils) are frequently encountered as a result of a combination of high precipitation levels, high tides, or spring freshet conditions. Saturated soils can result in reduced yields, delayed planting in the spring, flooding and harvesting problems. To counteract the detrimental effects of saturated soils on agriculture, there is extensive private on-farm and municipal drainage infrastructure in place.

Despite the annual need to manage excess soil moisture through adequate drainage, in the summer months many farms in the RAA require irrigation to sustain production. Approximately 48% of all cultivated field crops in the RAA are irrigated (B.C. MOA 2014). In many municipalities, the drainage systems are designed to serve irrigation needs as well. Irrigation sources include withdrawal from surface water, groundwater, and municipal water systems. The limiting factor for agricultural water supply in the RAA is infrastructure requirements and the associated costs of storing or delivering water to agricultural producers, rather than overall water availability (Golder Associates Ltd. 2008).

To address agricultural drainage, irrigation, and water supply issues, the province and municipalities within the LAA and RAA have invested significantly in upgrading drainage and irrigation networks to bring systems to be consistent with the B.C. *Agricultural Drainage Criteria* (B.C. MOAFF 2002), improve irrigation water quality, and increase water supply. Specifically Richmond and Delta have significantly improved their drainage and irrigation systems with new ditch construction or upgrades, new or improved pump stations, and remote salinity monitoring. For example, the Delta Irrigation Enhancement Project (DIEP), constructed as part of the mitigation strategy for the SFPR project, provides greater flow capacity and non-saline irrigation water during the summer months. Due to the complexity of these drainage and irrigation systems, additional improvements and on-going maintenance are needed to optimize their functions.

To address limitations in the existing systems, municipalities (particularly Richmond and Delta) are committed to continuing with drainage and irrigation system improvements in the near future.

5.4.2.3.3 Farm Infrastructure and Operations

Land Use and Cropping

The RAA includes less than two per cent of the total area of farms in B.C.; however, farms in the RAA generate over twenty-five percent of the total gross farm receipts based on the most recent census (Statistics Canada 2011). This is largely due to the moderate climate in the RAA compared with the rest of the agricultural areas in B.C., and the proximity to markets. Forage and pasture are the most common crop type in the RAA, accounting for 49% of all cultivated land (i.e., prepared and used for raising crops; tilled). Berries are the next most common followed by vegetables, nursery, and tree plantations. In addition to cultivated field crops, there are 491 ha of land in greenhouses and other buildings used to produce crops. The majority of all such buildings in B.C. occur in Delta, the Township of Langley, and Surrey.

Cranberries are the most dominant crop in Richmond, and account for approximately 33% of B.C.'s cranberry acreage (Statistics Canada 2011). Cranberry production primarily occurs in the area north of Highway 91 and east of No. 6 Road. Many of the cranberry farms are farmed as contiguous properties with an average parcel size of approximately 20 ha. Agricultural land use south of Highway 91 generally comprises smaller land parcels, around four hectares, in blueberries and vegetables. Due to the small parcel sizes, many farm operations work multiple land parcels throughout Richmond, often located far apart.

Delta's average farm size (35 ha) is the largest of any municipality in Metro Vancouver, and is over twice that of the Metro Vancouver average, which indicates the importance of full-time commercial farming in Delta. Potatoes are the largest agricultural commodity produced with approximately 1,532 ha of farmland in potato production (Statistics Canada 2011). Delta is also a large greenhouse vegetable and field vegetable area, with approximately 50% of B.C.'s greenhouse vegetable area, and about 25% of the field vegetable area.

Agricultural Economy

The RAA is one of the most important food producing areas in B.C. and is a vital component of Metro Vancouver's regional economy. In 2011, gross farm receipts from farms in the RAA were estimated to be \$789 million. This equates to 27% of the gross farm receipts for all of B.C., generated on only about 2% of the province's farmland. The revenue generated from agriculture in the RAA has increased 228% over the 20 years leading up to 2011 (Statistics Canada 2011).

Farming is also a substantial part of the economy in the LAA. According to the 2011 census of agriculture, Richmond's agricultural economy generated \$48.6 million in gross farm receipts, while Delta generated \$167.2 million (Statistics Canada 2011). This represents 1.6% and 5.7%, respectively, of the total gross farm receipt revenues of all of B.C. (Statistics Canada 2011). The revenues generated from agriculture have increased, by 11% for Richmond and 401% for Delta, since 1990. The increases in Delta are greater than the increase in the consumer price index for the same period. Thus, agriculture is a thriving and growing industry, especially in Delta.

Agriculture within OCPs and Agricultural Plans

Municipalities in the RAA are currently facing several challenges relating to agriculture. These include issues such as drainage and irrigation, urbanization pressures, high agricultural land values that limit the entry of young farmers, and farm business factors such as the high cost of farm labour, nutrient management, fuel, and fertilizer. To alleviate these issues, most of the municipalities in the RAA have developed agricultural policies and strategies as part of their Official Community Planning to enhance agricultural viability by supporting and protecting

agriculture within each region. Most municipalities have also developed detailed Agricultural Plans which are intended to augment the agricultural policies and strategies outlined in their OCPs. In addition, Metro Vancouver has developed the Regional Food System Strategy to address interest in food issues. Goals of this strategy include increasing capacity to produce more local food, and improving the financial viability of the food sector (Metro Vancouver 2011). In 2013, the Tsawwassen First Nation developed an agricultural plan to manage Tsawwassen First Nation agricultural lands.

Richmond Agricultural Viability Strategy and Backlands Policy

In 1999, Richmond embarked on a process to develop an Agricultural Viability Strategy to manage their agricultural areas for long-term viability (Richmond, 2003). The goal of the strategy is to enhance agricultural viability in Richmond by not removing land from the ALR unless there is a substantial net benefit to agriculture, and there is consultation with agricultural stakeholders. The strategy's guiding principles are as follows:

- The dominant use of the land in the ALR will be for a competitive, diverse, and flexible agricultural industry.
- The stability and integrity of the ALR boundary will be supported and maintained.
- Agricultural economic growth, innovation, diversification, and best practices are the best ways to protect agricultural land in Richmond and to ensure the ongoing viability of agricultural operations.
- Urban development in the ALR will be minimized.
- Subdivision in the ALR will be minimized, except where it supports agricultural viability (e.g. diversification, expansion, etc.).
- Richmond farmers will be provided with the necessary support, services and infrastructure that are required for agricultural viability.
- Residents of Richmond will be encouraged to learn more about agriculture in their city and to support locally grown agricultural products.
- Effective and positive communication with the general public and the agricultural sector will be a priority.
- Decision-making will be coordinated in a consultative manner and will consider all potential impacts on agricultural viability.
- A sustainable environment will be maintained to provide quality air, water, and land which supports and complements farming.

The City of Richmond also developed a policy for the area identified as the No. 5 Road Backlands Policy Area (the Backlands). The Backlands comprise 33 parcels to the immediate west of Highway 99, between Blundell Road and Steveston Highway, that are zoned for agricultural and assembly use. This area was re-zoned in the 1990s to support Assembly District uses within 110 meters along No. 5 Road while maintaining the remaining eastern portions of the property for agricultural purposes.

To ensure that active farming occurs on the Backlands, the City of Richmond established the Backlands Policy that outlined landowner requirements for farming this area in 1990. The current Backland Policy (Policy 5037) was adopted in 2000 and stipulates that all landowners subject to the policy are required to submit a detailed farm plan to the ALC and demonstrate that the agricultural areas are being actively farmed. To date, only three of the nine parcels required³ have submitted a detailed farm plan. However, limited and/or intermittent farming is occurring on most properties.

Delta Agricultural Plan

Delta has created an Agricultural Plan that contains strategies to assist in pursuing the long-term viability of farming in the community to address these issues (Delta 2011). The successful future of Delta's agriculture will depend on several factors, including the ability to attract complementary agri-industry, reduce costs, diversify, add economic value, attract new entrants, mitigate or offset impacts from projects, comply with regulatory processes, and meaningfully engaging the public in support of agriculture. Delta's 20-year vision includes the following goals:

- The agricultural sector is highly productive, creating efficient production systems and significant value-added activity, assisted by well-functioning infrastructure.
- Local agriculture effectively services local and non-local markets.
- Agriculture's ecological and social attributes are recognized by and cost-shared with society.
- Farming is attractive and accessible, providing a successful alternative career for younger people and new entrants.
- Agriculture will have successfully adapted into the future by adopting new technology, embracing innovation, adjusting to climate change, and reducing reliance on fossil fuels.

³ Parcel #36 (BC Muslim Association) is zoned as Assembly Use only, is fully developed and is therefore exempt from this requirement.

Metro Vancouver Regional Food System Strategy

In 2011, the Metro Vancouver Board adopted the Regional Food System Strategy (the Strategy, Metro Vancouver 2011) to address the regional interest in food issues. This Strategy is part of Metro Vancouver’s commitment to making a sustainable region. The Strategy provides a framework for creating a collaborative approach to a sustainable, resilient, and healthy food system that will contribute to the well-being of all residents and the economic prosperity of the region while conserving our ecological legacy (Metro Vancouver 2011). This will be achieved by meeting six goals:

1. Increasing capacity to produce more local food
2. Improving the financial viability of the food sector
3. Encouraging people to eat healthier diets
4. Ensuring a more equitable access to nutritious food
5. Reducing food waste in the food system
6. Protecting the ecological health of our region and surrounding water

The first two goals are vital to the agricultural sector of the RAA. Metro Vancouver proposes increasing capacity to produce more local food by protecting agricultural (ALR) land and enabling the expansion of agricultural production through access to water, labour, and protecting farmers’ rights to farm. To improve the financial viability of the food sector, Metro Vancouver plans to increase the capacity for distribution of local food (Metro Vancouver 2011).

Tsawwassen First Nation Agricultural Plan

Tsawwassen First Nation’s Agricultural Plan provides a framework and roadmap for executing its vision regarding management of agricultural land resources (Zbeetnoff 2013). Tsawwassen First Nation has 217 ha of agricultural land within Tsawwassen treaty lands. The plan aims to protect the productive agricultural land base by ensuring transportation and access routes do not interfere with farmland and that farmers have access to their fields with heavy equipment. Lands designated Agricultural are within the ALR.

5.4.3 Potential Effects

This section discusses anticipated interactions of Project components and activities with agricultural use, and potential effects of such interactions on the land in the ALR, irrigation and drainage, and farm infrastructure and operations. Information on mitigation of potential effects, including Project design measures to avoid adverse effects, is provided in **Section 5.4.4 Mitigation Measures**. Potential residual effects (i.e., effects remaining following

the implementation of mitigation measures) are described in **Section 5.4.5 Residual Effects and their Significance**. A discussion of potential cumulative effects on agricultural use is presented in **Section 5.4.6 Cumulative Effects**.

5.4.3.1 Project Interactions

An overview of potential interactions between Project activities and agricultural use during the construction and operation of Project components is provided in **Appendix B**. A preliminary evaluation of the potential effects of Project interactions on agricultural use, intended to focus the assessment on those interactions of greatest importance, is provided in this section. Interactions rated as having no potential for effects are not considered further in the assessment. The following are effects that could potentially occur. The assessment of potential effects begins in the following **Section 5.4.3.2**.

Construction: Potential interactions with and effects on agricultural use during Project-related site preparation and construction activities could include the following:

- Changes to irrigation and drainage systems
- Changes in transportation between farm parcels, markets, and suppliers
- Short-term disturbance to livestock
- Accidental spills of deleterious substances
- Sedimentation in agricultural drainage ditches
- Degradation of agricultural soils
- Changes to farm utilities and infrastructure
- Economic considerations

Operation: Potential interactions with and effects on agricultural use during Project-related operation and maintenance activities could include the following:

- Change in area of available agricultural land
- Severance or isolation of farm parcels and other changes in the viability of individual farms
- Increased runoff from new impervious surfaces that may affect soils and crops
- Temporary disruption of drainage during ditch maintenance

Potential positive effects as a result of the Project include:

- Alleviation of traffic volumes during peak hours, improving travel times and reliable access to farms
- Increasing efficiency of farming operations
- Improvement to drainage and irrigation ditches that run alongside the highway

5.4.3.2 Potential Effects

The methods used to assess potential Project-related effects on agricultural use are based on the ALC's *Planning for Agriculture - Resource Materials* (Smith 1998), which provides guidance for completing Agricultural Impact Assessments for large projects in the ALR, and includes an overview of potential impacts that should be assessed to determine if a project will have a significant impact on agricultural use. In general, the document recommends assessing the impacts on the agricultural resource, drainage and irrigation, land use compatibility, air quality and noise, transportation and traffic, and services such as stormwater and sewer.

5.4.3.2.1 Effects on Land in ALR

Loss of Agricultural Land

The Project will result in the removal of narrow segments of ALR land adjacent to the Highway 99 corridor between Blundell Road and Steveston Highway Interchange in Richmond, and River Road and Highway 17 in Delta. **Table 5.4-9** shows the estimated area of agricultural land that would be removed from agricultural production within the Project alignment, summarized by capability class. The total projected removal is a maximum of approximately 20 ha, of which approximately 17 ha is currently productive ALR land. The estimates in **Table 5.4-9** were generated by placing the property acquisition areas (obtained from the Ministry) along the design footprint (see **Appendix A, Maps A1 to A13**). These estimates represent the maximum extent of land required for the new alignment, including cut and fill slopes, setbacks and drainage related infrastructure.

The collective loss of ALR area may be considered equivalent to losing slightly more than one average-sized farm in the LAA. Approximately 20 ha of Class 1, 2 and 3 soils, based on the improved land capability ratings will be removed by the Project (**Table 5.4-9**). As noted earlier, the improved land capability rating is the appropriate indicator of land quality because drainage and other improvements have been widely implemented throughout the RAA.

Table 5.4-9 Estimated Agricultural Land Loss from the ALR

| Agricultural Capability Class (Improved) | Area (ha) | Area (% of total) |
|--|-------------|-------------------|
| 1 | 2.7 | 13 |
| 2 | 12.6 | 63 |
| 3 | 3.9 | 20 |
| 4 | 0 | 0 |
| 5 | 0 | 0 |
| 6 | 0 | 0 |
| 7 | 0 | 0 |
| Other | 0.9 | 4 |
| Total | 20.1 | 100 |

Note: This table summarizes the gross removal of agricultural land from the ALR, prior to consideration of surplus lands that can be returned to agriculture by the Ministry.

Based on the current Project design, agricultural land loss is expected to occur on 32 properties (**Appendix A, Figure 1a – 1aa**; highlighted orange). There may be slight changes to the Project design during final design stages; however, they are expected to be minor and the nature of the potential removals (i.e., narrow strips of land parallel to the roadway) will not change appreciably.

Individual losses to each of the 32 properties will be minor in extent, ranging from 0.01 ha to 2.8 ha on sites that are 0.2 ha to 51.4 ha. These sites are a mix of cultivated fields, non-cultivated fields, filled land, and non-productive sites (paved land).

Loss of agricultural land is considered an adverse effect because of the importance of preserving high capability agricultural lands within the ALR. The ALC, along with municipalities in the RAA, generally discourage removal of land from the ALR unless there is a demonstrated net benefit to agriculture through compensation or improvements as a result of non-agricultural development in the ALR.

Accordingly, to offset the losses listed in **Table 5.4-9**, the Ministry has identified several Crown or Ministry-owned parcels of land that will be made available for agricultural use. The potential for these additions to offset the losses from the new alignment and provide a net gain in available agricultural land is discussed in **Section 5.4.4.4**.

Degradation of Agricultural Soils

Degradation of agricultural soils is primarily related to temporary construction work that may affect soil quality. Soil quality degradation can occur in laydown areas, temporary construction areas, or heavy traffic areas where soils can become compacted. Soil compaction can impair water infiltration into soil, crop emergence, root penetration, and crop nutrient and water uptake. These can all result in lower crop yields.

Soils can also be degraded through soil contamination, soil erosion, and soil mixing. Soil contamination can occur as a result of chemical or fuel spills or contaminants from run-off water (e.g., oils). Project activities that disturb and expose soils can also result in soil erosion (either through water or wind erosion). Soil mixing, or admixing, can occur in temporary laydown areas where topsoils are salvaged for future reclamation.

5.4.3.2.2 Effects on Irrigation and Drainage

Drainage, Water Quality, and Irrigation

The Project has the potential to affect municipal drainage infrastructure and irrigation sources in the LAA, as well as on-farm drainage. Agricultural operations in the LAA rely on effective on-farm and municipal drainage and irrigation infrastructure (**Section 5.4.2**). The planned Project upgrades to Highway 99 will involve the replacement of some drainage structures within the new bridge and highway prisms, and some ditches and control structures may need to be moved or changed to accommodate the Project footprint.

Temporary alteration of drainage patterns, potential for sedimentation, and loss of access to irrigation water may negatively affect agricultural operations during the Project construction phase. Temporary alteration of drainage patterns also has the potential to disrupt existing drainage, resulting in saturated soils, reduced yields, delayed planting in the spring, and flooding and harvesting challenges. From a water quality and irrigation perspective, farmers who irrigate are most concerned about the negative impacts of high sediment concentrations (which can damage pumps), salinity and, to a lesser extent, agricultural chemicals or leachate from industrial areas (Klohn Leonoff Ltd. et al. 1992).

Locations where there is potential for effects on drainage or irrigation water quality include the highway drainage ditches on both sides of Highway 99 primarily between Blundell Road and the Steveston Highway interchange in Richmond, and between River Road and the Highway 17 interchange in Delta, where existing highway ditches will need to be relocated and reconstructed as part of the Project.

Fraser River Salt Wedge

Background

The salt water in the Strait of Georgia at the mouth of the Fraser River is denser than the outflowing river water. During the rising tide, this denser saline water advances up the river along the channel bottom while the river water flows over the top, creating the characteristic wedge shape. The Fraser River salt wedge has been studied since the 1960s, and monitoring in the early 1970s led to the development of a numerical two-layer model that was used to predict salt wedge behavior and thickness during low-flow conditions (Hodgins 1974, 1977). Due to the importance of salt wedge processes for fisheries, wastewater discharge, navigation, and agriculture (e.g. Ages 1979, 1988), monitoring continued in the 1970s and 1980s to assess wedge behavior under a range of tidal and river flow conditions. Later research was aimed at developing a better understanding of the factors that explain variations in the maximum upstream extent of the salt wedge, and the role that the salt wedge plays in causing sediment deposition at the mouth of the river (Kostachuck and Atwood 1990). On the latter point, sediment deposition occurs when the velocity of sediment-laden river flow slows and turbulence decreases as it is forced over the wedge. This process is referred to as shoaling. Shoaling is a complex process because the salt wedge influences sediment accumulation in the channel, which in turn affects salt wedge movement.

Recently, interest in the salt wedge has centred on potential effects if the Fraser River were to be dredged to enhance shipping access upstream of the Tunnel after the Tunnel is removed and replaced with a bridge (ter Borg 2015). There are currently no formal proposals to carry out such dredging. The results of on-going studies about the potential effects of dredging, which are being undertaken by the University of British Columbia and the Delta Farmers' Institute, are expected later in 2016.

Decommissioning of the Tunnel may have the potential to alter the hydraulic characteristics of the Fraser River, and questions have been raised as to whether or not those changes would influence the extent of the salt wedge in the river, and the salinity of the water within the wedge affecting irrigation water quality. Although the salt wedge regularly extends as far as Annacis Island under low flow conditions, such as January to March (Ages 1988), it reaches the irrigation pump station at 80th Street intake in Delta less frequently during the irrigation season (based on Neilson-Welch 1999). However, there are periods when the water in the vicinity of the 80th Street intake is too saline to be used for agricultural irrigation, and the key question is whether or not Tunnel removal could increase the length of time when the water is too saline for agricultural use.

The Province of B.C. has published guidelines for irrigation water quality that are based on a combination of water electrical conductivity and the sodium adsorption ratio (Tam and Peterson 2014). Crop selection begins to be restricted when electrical conductivity in the irrigation water is greater than 0.7 deci-Siemens per metre (dS/m), and is severely restricted if above 3.0 dS/m. With respect to berry crops, EC values <0.5 dS/m are considered safe for all berries, 0.5 to 3.0 dS/m are considered safe for most berries, and >3.0 dS/m is considered injurious to most berries (BC Ministry of Agriculture 2012). Typical salt wedge conductivity values are higher than 3.0 dS/m, although during flood tide the salt wedge is situated at the river bottom with the fresh water flowing over top. On ebb tides, however, turbulent mixing occurs and the surface water becomes saline. A sensor at the 80th Street intake stops inflow to the irrigation pump house when electrical conductivity reaches the threshold set by the City of Delta based on crop needs (Tetra Tech EBA 2015).

Modelling Potential Project Effects

To evaluate the potential for effects on irrigation water quality due to Project-related changes in the salt wedge, the effects of the removal of the Tunnel on the behaviour of the salt wedge in the Fraser River were evaluated by the Ministry (see **Appendix 16.7 Fraser River Salt Wedge Modelling**). This was accomplished using a three-dimensional hydrodynamic model (called H3D) that compared existing conditions with predicted conditions following Tunnel removal (Tetra Tech EBA 2016). The model was run for the hydraulic conditions measured in the Fraser River during the late fall of 2011 because that period coincides with the collection of bank-to-bank bathymetry data and salinity monitoring using a sensor installed in the river at the 80th Street intake in Delta. This enabled the modelling team to validate the model using actual salinity data from at the intake. The key results of the modeling exercise are summarized as follows:

- The model could replicate the trend of salinity and its variability on a daily time scale near the intake with reasonable accuracy during validation (i.e., with the Tunnel in place), although modelled salinities were generally higher than observed (i.e. more conservative). This may be partly explained by the high degree of variability in salinity near the intake that appears to be related to the presence of a shallow bench along the shore near the intake and turbulence as tides recede.
- Although model results varied from observations at the intake, it was assumed that the differences in river hydrodynamics with and without the Tunnel would be captured by the model since salinity trends were well represented on a daily time scale.

- Using a conservative criterion of 0.4 dS/m (i.e., 20% below the “cut-off” threshold of 0.5 dS/m), the model was able to predict the overall trend in the number of hours per day when water can be drawn from the river for irrigation. The model tended to be conservative, indicating fewer hours within the acceptable criterion (range of approximately 4 to 19 hours per day) than the observed (range of 4 to 24 hours per day).
- Under baseline conditions, (i.e., with the Tunnel in place) the salt wedge remains mostly downstream of the Tunnel until the Fraser River flow drops below 2,000 m³/s, usually in November.
- When the model was run continuously for the September to November period, there was only a small difference between salinity behavior with and without the Tunnel.
- The salt wedge advances slightly further in the case without the Tunnel than with the Tunnel, but the differences in salinity were slight, with most values about 0.1 ppt higher⁴. The greatest projected differences (up to about 0.38 ppt) occurred when the salinity levels were already above the threshold for irrigation.
- Natural features along the bottom of the Fraser River between the mouth and the intake (such as sand dunes) have similar topographic relief as the existing Tunnel. These dunes are constantly changing in size and locations, and any one feature (i.e. one dune or the tunnel) has a minor role in overall salt wedge behaviour.

The major conclusions drawn by the authors (Tetra Tech EBA 2016) are:

- The timing window during which the salinity of the water exceeds the threshold for irrigation is almost identical for the two cases (i.e. with and without the Tunnel).
- Tunnel removal will not affect the behaviour of the salt wedge.

5.4.3.2.3 Effects on Farm Infrastructure and Operations

Farm Parcel Fragmentation and Changes to Farm Parcel Boundaries

Fragmentation of existing farm parcels and farm parcel boundary changes have the potential to affect farm economics by making remaining parcels too small to be farmed, resulting in a shape that is impractical for farm machinery to operate. Based on the current Project design, no farm properties will be bisected or otherwise fragmented by the Project.

The Project will result in removal of narrow segments of land adjacent to Highway 99, potentially resulting in property boundary changes, somewhat smaller farm parcels on specific properties, and some changes to field configuration. For most parcels, this loss of land is considered

⁴ The provincial irrigation guidelines are based on electrical conductivity (EC), whereas the model results are presented using salinity units (parts per thousand, ppt). Tetra Tech-EBA has established a local conversion factor to enable comparison of the model results to guidelines.

relatively small and is not expected to significantly change field configurations since the boundary changes occur on the perimeter of fields. Therefore, the impact of the Project on farm configuration is expected to be neutral on the majority of the farm parcels affected, with the exception of the following properties:

- Property #62 (**Appendix A, Figure 1n and 1p**) – potato/vegetable farm located on the west side of Highway 99 on River Road
- Properties #67 and #68 (**Appendix A, Figure 1p and 1q**) – two parcels of land that are owned by the provincial government located along the southeast side of Highway 17A in Delta

Project activities on Property #62 will result in the reconfiguration of this parcel into a shape and size that is likely to affect the farm's operations. The parcel is currently 9.7 ha; and the Project will result in a reduction of approximately two hectares; however, the shape of the remaining area (7.7 ha) is such that a portion will be difficult to farm, reducing the area suitable for agricultural production to approximately 5 ha.

Project activities on Properties #67 and #68 will result in the reconfiguration of these two parcels into a shape and size that may affect current farming operations. These parcels are currently farmed under lease as part of a larger field unit with the contiguous property to the south (shown in **Appendix A, Map A-9**). Together, the two parcels are currently 6.2 ha. The Project will result in a reduction of these parcels by 3.6 ha; however, the remaining parcels are expected to continue to be farmed in concert with the adjacent, privately owned field.

The impact of the Project on Property #55 (a fill site that is under ALC reclamation approval) located at the Steveston Interchange in Richmond is not expected to significantly affect potential agricultural use on this relatively large property.

Changes to On-farm Utilities

With any highway construction project there is potential for temporary disturbance of on-farm utilities (e.g., power, telephone, gas, etc.). For the Project, this may occur within the Project footprint or on those properties located adjacent to the Highway 99 corridor where most utility lines are located. Although there are regional power lines that will have to be moved, there are no on-farm power lines that will be affected. Nevertheless, disruption of utilities can have a negative effect on livestock operations and greenhouses where even short-term loss of light or heat could have serious economic implications. If any disruption is necessary during construction, permanent restoration of services is straightforward.

Fencing, Public Access, and Security

During Project construction, some existing fences will need to be removed and relocated and, where applicable, new fencing will be installed in accordance with current highway design standards. Agricultural fencing is not only important for traffic safety and livestock protection, it also helps to deter trespassing, vandalism, theft, and dumping of waste into ditches or on farm land.

Changes in the Agricultural Landscape and Stakeholder Perceptions

In addition to food production, agricultural land in the RAA provides a number of other ecological and socio-community benefits including wildlife habitat (especially in winter), nutrient and organic matter recycling, carbon sequestration, climate regulation, and stormwater and flood management (Metro Vancouver 2011). Agricultural land also contributes aesthetically as a form of green space, and is considered to be part of the green zone within Metro Vancouver, along with parks and other undeveloped areas. In general, there is a correlation between the loss of ALR land and a decline in ecological and socio-community interests associated with green space.

With respect to wildlife, there are several programs that support habitat by minimizing financial effects on farms. For example, the Delta Farmland and Wildlife Trust helps to fund winter cover crops, grassland set-asides, and hedgerows, and compensates farmers of perennial forage crops for damage done by overwintering waterfowl. Effects of the Project on wildlife and wildlife habitat are addressed in **Section 4.8 Terrestrial Wildlife**.

Although not straightforward to quantify, there is potential for effects on agricultural use related to the perception that the Project alignment has become more developed, and its character is more urban. In general, farm properties along major transportation routes and in the urban-rural fringe are more likely to be farmed at a lower intensity or held by speculators despite being in the ALR. Mitigating this tendency is accomplished largely through the measures that will be implemented for other potential agricultural effects (see **Section 5.4.4**), especially minimizing the Project footprint, consolidating farm parcels into more economically-viable units, irrigation/drainage improvements, and installing visual landscape buffers where appropriate.

Transportation and Network Access

During construction, potential effects to agriculture include increased travel times for farmers and processors due to detours, wait times, and general Project-related congestion. This could result in reduced efficiency and added costs. Post construction, however, the utility of Highway 99 as a corridor for the transportation of agricultural goods and services would be significantly

improved, and have a positive effect on agriculture in the LAA, particularly for Richmond farmers and processors. Several farmers located in the vicinity of the Tunnel stated, during field interviews, that the new bridge would directly benefit their operations (see **Section 5.4.4**).

Noise and Air Quality Effects on Farm Animals

The potential effects of the Project on ambient air quality and atmospheric noise have been assessed and the results are presented in **Section 4.9** and **Section 4.10** of this Application. Those assessments focus on potential effects on humans; however, the results of these assessments can be used to evaluate the possibility of effects on farm animals, which include common livestock. At present (2016) there are very few livestock operations adjacent to Highway 99 in Richmond or Delta (there is a beef operation between 64th Street and Highway 17 in Delta).

For air quality, the evaluation of potential effects on farm operations is based on the findings of **Section 4.9 Air Quality**. The assessment concluded that implementation of the Project (i.e. during operation) will result in an overall improvement in air quality compared to existing conditions and future conditions without the Project, primarily due to a reduction in traffic congestion and better dispersion of emissions from traffic moving over an elevated bridge rather than through the Tunnel. Short-term changes in local air quality can be mitigated effectively. As such, no adverse effects on farm animals from the Project are anticipated.

Fuel-combustion pollutants degrade some of the chemicals that make up floral odors, and the absence of those floral chemicals affects honeybees' ability to recognize the scent and locate its source. The anticipated Project-related improvement in air quality could, therefore, be beneficial to bees and other pollinating insects as well.

Ground level ozone (O₃) has been shown to reduce agricultural yield and crop growth by reducing the resistance to fungi, bacteria, virus, and insects, thereby reducing growth and inhibiting yield and reproduction. Estimations of the change in O₃ concentrations, as summarized in the **Section 4.9 Air Quality**, suggest that the overall change in O₃ is negligible, with a worst-case estimate of a peak change of 0.1 µg/m³ in the 24-hour average concentration. This change falls within the typical limit of detection of monitoring equipment; therefore, there is no measureable change in O₃ anticipated as a result of the project.

There are currently very few farm animals within about one kilometre of the Project, any farm animals along the Highway 99 corridor will already be acclimatized to traffic noise. Given this, any increases in noise would have negligible effect on farm animals, specifically livestock.

Economic Considerations

Farmers that are directly affected by the Project (i.e., where there is permanent land loss or soil degradation) may experience reduced revenues due to their reduced land-base and/or lower crop yields where temporary disturbances result in soil degradation. While soil degradation is considered reversible, increased travel time during Project construction may temporarily result in reduced efficiencies, reduced revenue, and added costs associated with transporting agricultural goods and services.

Once the Project is operational, reduced travel time is expected to have a positive effect on agricultural revenues in the LAA and RAA due to reduced labour time and operating costs associated with the transportation of goods and services.

5.4.4 Mitigation Measures

A hierarchical approach based on the four types of mitigation as outlined below was used in identifying strategies to avoid or minimize potential Project-related effects:

- **Avoidance:** Measures to avoid potential effects on the VC have been/will be incorporated into project considerations such as site and route selection, project design, project scheduling, and construction and operation procedures and practices.
- **Minimization:** Where potential effects on the VC cannot be avoided through project considerations, standard mitigation measures, best practices, and construction and operation environmental management plans (EMPs) will be implemented to minimize potential Project-related effects or reduce them to acceptable levels.
- **Land Restoration and Reclamation:** Where potential Project-related effects cannot be avoided or minimized through standard mitigation measures, best practices, or implementation of EMPs, affected components will be restored to pre-Project conditions, or to an improved agricultural condition.
- **Enhancement or Compensation/Offset:** Where on-site restoration or land reclamation is not feasible, appropriate means to counteract, or make up for potential Project-related effects on the VC will be identified.

Selection of mitigation measures was based on current best management practices (BMPs), as well as information gathered through stakeholder meetings to identify strategies to offset potential Project-related effects on agricultural values. Stakeholder meetings involved discussions with individual farmers, Farmers' Institutes, municipalities of Richmond and Delta, and the ALC.

5.4.4.1 Avoidance

Minimizing direct effects on agricultural lands through avoidance of agricultural land and farm infrastructure was one of the key design goals for the Project. Avoidance measures integrated into Project design include accommodating Project components and activities within the Highway 99 ROW to avoid direct effects on agricultural land and incorporating drainage works (e.g. new ditching) and related rainwater management structures that meet provincial and local government standards for agricultural areas and purposes. Rainwater runoff from the new bridge over the Fraser River will be captured in pipes so it does not directly enter the river, with the runoff directed to ponds or wetlands on either side of the river. All bridge-related rainwater infrastructure will be located outside the ALR.

5.4.4.2 Minimization

Environmental protection measures that will be implemented during Project construction and operation to prevent or minimize potential effects on agricultural use will be outlined in a Construction Environmental Management Plan (CEMP), and subsequently in an Operation Environmental Management Plan (OEMP), as described in **Section 12.0 Management Plans**. The CEMP will include an Agricultural Management Plan that describes standard best practices and Project-specific mitigation measures to prevent or minimize potential effects on drainage, water quality and irrigation, farm infrastructure and operations, and soil conservation, storage, and reclamation. The best management practices (BMPs) and mitigation measures (summarized in the following subsections) have been widely used and successfully implemented on other transportation corridor projects (e.g. SFPR) to effectively minimize impacts on agricultural land and use. The BMPs will be customized for the site-specific conditions in the Project area.

The plans will also include an outline of monitoring programs to ensure that mitigation is effectively implemented. Key elements of the Agricultural Management Plan that will minimize the potential impacts to Land in the ALR, Irrigation and Drainage and Farm Infrastructure and Operations are outlined below.

5.4.4.2.1 Land in the ALR

The following mitigation measures will reduce the potential for degradation of agricultural soils during Project construction:

- Use non-arable areas for temporary laydowns and roads, where possible.

- Where possible, undertake construction activities during dry conditions to minimize soil erosion and compaction. Avoid working during high winds if exposed soils are subject to wind erosion.
- To the extent possible, avoid situations where construction vehicles or equipment would pass through agricultural fields.
- If construction equipment passing through agricultural fields is unavoidable, use the lowest acceptable tire pressure on heavy equipment or reduce load by keeping axle weight to a minimum.
- Salvage topsoil and subsoil along temporary roads or laydown areas. Stockpile soils to reclaim areas that could be improved for agriculture. Stockpile topsoils and subsoils separately to avoid admixing. Seed longer-term topsoil storage piles to avoid erosion, organic matter loss, and infestation by weeds. Store any excavated saline subsoils separately. As part of reclamation, disk all disturbed field areas or subsoil to alleviate compaction.
- Incorporate, as part of an Emergency Response and Spill Contingency Plan of the CEMP, measures to prevent accidental spills and contamination of soils during construction.
- Incorporate, as part of the Erosion and Sediment Control Plan of the CEMP, measures to reduce soil erosion and sediment transport.

5.4.4.2.2 Irrigation and Drainage

Drainage and irrigation effects will be mitigated by reconstructing or upgrading ditches in accordance with the B.C. Standard Specifications for Highway Construction (Ministry of Transportation and Infrastructure 2011), and by considering the B.C. *Agricultural Drainage Criteria* (B.C. MOAFF 2002) for areas where Project runoff could affect farm fields. The Project will be constructed in a way that enables key ditch systems to continue to function (i.e. maintain water levels during the stipulated design storm events to pre-construction levels or lower), and that water quality is suitable for irrigation in those locations where farmers currently obtain all or part of their irrigation supply from ditches that could be affected by the Project. The following specific drainage objectives will be incorporated into the design standards for the Project to mitigate identified risks:

- Provide improvements to infrastructure so that no increase in flooding occurs as a result of the 100-year design storm event.
- Provide improvements to infrastructure to mitigate flow volume increases to municipal pump stations.
- When replacing or installing new culverts, increase sizes to comply with current design criteria and consider possible climate change effects.

- Retain existing ditches at existing elevations and capacities. Increase capacity of ditches for additional storage and conveyance where possible.
- Deepen ditches in specific locations to improve drainage capacity and enable their use for irrigation.
- Re-grade and clean existing ditches within the corridor to improve hydraulic capacity and flow efficiency.
- Add stormwater management ponds where possible to capture highway runoff and control the flow release rates.
- Add temporary water management systems during construction, as needed.

If these steps are implemented, the relocation and reconstruction of drainage ditches along the Highway 99 corridor is expected to result in drainage improvements within the LAA.

5.4.4.2.3 Farm Infrastructure and Operations

Changes to On-Farm Utilities

Farm operators, particularly livestock or greenhouse operators, who may be affected by Project-related activities will be informed well in advance of any potential disruption to utility services—specifically power and natural gas supply—during construction. Alternative power sources (e.g., generators or temporary power lines) will be arranged to minimize potential effects of such disruption, where required. With proper planning and communication, residual effects to farm utilities are not expected.

Fencing, Public Access, and Security

Agricultural fences that are damaged or moved as a result of the Project will be replaced as appropriate. New fencing may be required in some locations where the highway ROW boundaries are altered. The following best practices related to access and security will apply:

- Move existing fencing just prior to construction, replace to Ministry standards (B.C. MOTI 2012), and to meet farm requirements.
- Consult with individual farmers of properties bordering the Project who have livestock, prior to installing the new or replacement fencing, to ensure that the fence is installed to maintain livestock and public safety. In some cases, fencing may have to be placed prior to the start of construction.

Provided existing fences are replaced to applicable standards, issues dealing with public access and security are considered negligible.

Agricultural Landscape and Stakeholder Perceptions

Measures implemented to mitigate other potential effects on agricultural use discussed in this section—specifically, minimizing the Project footprint and consolidation of farm parcels into more economically viable units will also mitigate for the effects of the Project on stakeholder perceptions of agricultural land in the LAA. Installation of visual landscape buffers at select locations will further reduce any Project-related effects on agricultural landscape and stakeholder perceptions. The ALC has published design guidelines for these types of buffers (ALC 1998). The need for, and specific locations of any buffers will be finalized during detailed design.

Transportation and Network Access

Traffic management during construction will be described in a Construction Traffic Management Plan that will be developed prior to construction. Traffic coordination along secondary roads in the LAA will be designed to facilitate the efficient movement of agricultural traffic and mitigate for temporary disruptions and increased traffic during construction. The plan will be shared with the agricultural community prior to implementation.

Once operational, the Project will improve traffic flow within the Highway 99 corridor, particularly during peak hours, as well as provide more reliable cross-highway access for farm traffic. This will improve the movement of agricultural goods and services.

Economic Considerations

Economic effects related to agriculture can be mitigated or offset by the strategies used to mitigate other potential effects (as outlined above) whereby the agricultural productivity and viability, or both, of existing farm parcels are improved. These mitigation measures include:

- Consolidation of small farm parcels.
- Salvaging topsoil from permanent disturbance areas for use in field levelling in other areas of the LAA.
- Improvement to on-farm and municipal drainage and irrigation ditches.
- Increased transportation efficiencies.

5.4.4.3 Enhancement

Enhancement strategies will be implemented on several properties directly affected by the Project to counteract potential effects on farm infrastructure and operations. This will be achieved through consolidation of parcels and working with stakeholders (particularly in the Richmond Backlands area) to enhance the agricultural viability of specific properties.

5.4.4.3.1 Farm Infrastructure and Operations

Farm Parcel Boundary Changes (Consolidation)

Since changes in field configuration are expected to affect farm operations at only three properties (Properties #62, #67, and #68; **Appendix A, Figures 1n, 1p, and 1q**), mitigation measures will be incorporated to address the needs of these specific parcels. The Ministry is currently developing farm-specific mitigation plans in consultation with the ALC and affected land owners.

Two of the potentially affected properties (Property #67 and Property #68) are provincial government lands that have been historically farmed by a local family that leases these parcels from the government and farm them in combination with two of their private parcels located directly to the south. These fields are currently (in 2015) farmed with a variety of crops. The current field units are not aligned with property boundaries; rather, they are configured to take advantage of field drainage and ease of farm equipment use.

The recommended mitigation strategy to reduce the effects of boundary changes on the lands owned by the provincial government is to consolidate the remainders of the affected parcels and to continue to allow the land to be farmed with the adjacent private land parcels to the east.

Consolidation of parcels is considered an effective way to enhance existing agricultural operations on those parcels because of the greater efficiency and flexibility afforded by larger parcels. Consolidation of parcels has been successfully used on other ALR exclusion/non-farm use applications throughout the LAA and RAA to offset impacts to agriculture. Specific details of the consolidation will be developed in consultation with the ALC and the land owners.

Mitigation Considerations for Richmond Backlands

The Project will require approximately 4.5 ha of land, made up of narrow portions of ten properties in Richmond (Property #36 to #45; **Appendix A, Figures 1h – 1k**), located along the Backlands. To ensure that the highway widening does not hinder future agricultural development, the Ministry will work with the City of Richmond in developing practical mitigation measures for the Backlands. Potential Project-related mitigation measures that may be considered include:

- Maintaining and/or improving drainage/irrigation ditches to meet Agricultural drainage criteria.
- Salvaging surplus topsoil from highway widening areas for use in the Backlands (to be negotiated on a farm by farm basis).
- Maintaining or improving farm infrastructure (including fencing and buffering).
- Exploring potential consolidation of parcels (led by the City of Richmond).
- Exploring long-term agricultural lease options (led by the City of Richmond).

5.4.4.4 **Offsetting**

5.4.4.4.1 Offset of Land in ALR

The Ministry has identified several parcels of Highway 99 ROW totalling 21.4 ha that are currently unused, are not required for the Project, and will be made available for future agricultural use (area shown as green crosshatched in **Appendix A, Figures 1k, 1l, 1p, 1q, 1v, 1y, and 1z**). This includes areas that are currently occupied by highway infrastructure, but will be made available for potential return to agricultural use as discussed below:

- Reconfiguration of the Highway 17A Interchange to reduce the amount of ALR land required in the north-east and south-west corners, removing the old roadway, and reclaiming the ground to connect portions of the old ROW with the adjacent fields. On completion, some of this land could be returned to production or other agricultural use (e.g. equipment or produce storage, livestock feeding).
- Reconfiguration of the Steveston Highway Interchange from the current cloverleaf design reduces the amount of ALR land required in the south east corner. The old roadbed and the filled median area would then be reclaimed and consolidated with the adjacent Richmond Farm parcel(s).

Most of the areas within the highway ROW identified for potential return to agricultural use would be restored and reclaimed to equal capability as adjacent cultivated areas in an effort to offset Project-related loss of agricultural land, in cooperation with local farmers. In most cases these parcels are located immediately adjacent to actively farmed lands and restoration would incorporate the “new” land into the adjacent field. In some limited locations, the site could be made available for agricultural infrastructure purposes such as processing or storage.

If all 21.4 ha of the available land within the Highway 99 ROW, as discussed above, are eventually developed for agricultural use, a net gain of approximately 1.4 ha of agricultural land will be achieved. Given that 2 ha out of the 20 ha that will be acquired for the Project is currently non-productive land, primarily paved, Project-related offsetting could result in an effective gain of up to 3.4 ha of land for agricultural use.

The practice of offsetting project-related removal of agricultural land by adding the same area of other land with equal or better agricultural capability is an effective method of reducing overall effects on agricultural use because it results in no net loss of capability. It is anticipated that the land that will be made available for agricultural use would be of similar or better capability in comparison to the land acquired for the Project, or improved such that there is no net loss in capability, ensuring effective mitigation.

In addition to returning available land within the highway ROW to agricultural production, other mitigation strategies that increase productivity and optimize use of existing agricultural lands in the ALR, as discussed below, will also be implemented:

- Construction of elevated guideways at Steveston Interchange and 17A Interchange to reduce the impacts to agricultural land on Richmond Country Farms in Richmond and provincial government properties in Delta.
- Salvaging topsoil from permanently disturbed areas for use in levelling depressional, poorly-drained areas of near-by farm fields and reclaiming ROW parcels for crop use.

The mitigation strategies that will be applied to the individual farm properties are currently being developed by the Ministry in consultation with the landowners. Detailed mitigation strategies (such as consolidation and reclamation plans) will be completed during detailed Project design, following submission of the application to the ALC.

5.4.5 Residual Effects and their Significance

Residual effects are those effects that remain after implementation of recommended mitigation measures. The preliminary design largely contains the Project within the existing highway ROW and thereby has limited the potential effects of the Project on agricultural use to the areas adjacent to the Project alignment, which make up a small portion of the LAA. With implementation of standard BMPs for highway construction and operation and the recommended mitigation measures (**Section 5.4.4**), it is expected that a number of the potential effects of the Project on agricultural use, as listed below, can be fully mitigated or offset.

Land in ALR

- It is anticipated that there will be a net gain in agricultural land with the return of available lands within the highway ROW to agricultural use following Project construction.

Irrigation and Drainage

- Potential effects of changes to drainage, irrigation, and irrigation water quality will be fully mitigated.

Farm infrastructure and Operations

- All potential Project-related effects, including the following, are expected to be fully mitigated
 - Degradation of agricultural soils
 - Changes to on-farm utilities
 - Effects on public access and security
 - Changes in the agricultural landscape and public perception

Only one potential residual effect of the Project on agricultural use is considered further in this assessment:

- Changes to farm parcel boundaries (Farm infrastructure and Operations Sub-Component). This includes changes to the shape, size and configuration of farm fields and access to farm property.

This potential residual effect was characterized by qualitatively assessing the direction, magnitude, geographic extent, duration, frequency, and reversibility of the effect. Definitions for the ratings applied to the residual effect are presented in **Table 5.4-10**. These ratings were developed with specific reference to agricultural use in the LAA and RAA, and reflect the importance of agriculture in the Lower Mainland, the relatively high productivity and value of agricultural land in the LAA, and the potential for on-going pressures on farm land from urban growth in the region.

Context: Agricultural land in the LAA and Project footprint are located in the ALR where agricultural is recognized as the priority use and is encouraged, and on which other land uses are controlled. Agricultural land in these areas are comprised of Class 1 and 2 lands that are considered some of the best agricultural lands in Canada as they are highly productive and can support a wide variety of crops. Even relatively small farm properties in the LAA can be economically viable for certain production systems, therefore the area has less resilience to development effects than other parts of BC with lower capability where farm properties tend to

be larger. Recognizing the importance of agricultural land in the Project area and the drainage and irrigation infrastructure that supports it, the Ministry has designed the Project to accommodate the proposed works predominantly within the existing Highway 99 ROW, minimizing the need for land acquisitions in the ALR, and identified land parcels within the highway ROW that will be returned to agricultural production, resulting in a net gain in agricultural land. In this context, agricultural use in the LAA is expected to be resilient to minor changes in land parcel boundaries of a limited number of farms.

Table 5.4-10 Criteria Used to Characterize Residual Effects on Agricultural Use

| Criteria | Description | Definition of Rating | |
|-----------|--|----------------------|--|
| Direction | Overall nature of the residual effect | Adverse | Measureable negative effect on agricultural capability or farm viability |
| | | Positive | Measureable positive effect on agricultural capability or farm viability |
| | | Neutral | No or non-detectable effect on agriculture |
| Magnitude | Amount of the effect relative to natural or baseline conditions | Negligible | Effect not detectable at farm or LAA scale |
| | | Low | Effects detectable but will not affect farm viability |
| | | Moderate | Effects could affect viability of individual farms |
| | | High | Effects could influence farm activity in LAA |
| Extent | Geographic extent / distribution of the residual effect | Site | Limited to directly affected farm properties |
| | | Local | Effect detectable on farms beyond footprint in LAA |
| | | Regional | Effect detectable on farms beyond footprint in RAA |
| Duration | Length of time over which the residual effect is expected to persist | Transient term | Limited to field investigations or <1 month during construction |
| | | Short term | Limited to Project construction phase |
| | | Moderate term | Will affect VC during first five years of operation |
| | | Long term | Effect is permanent |

| Criteria | Description | Definition of Rating | |
|---------------|---|----------------------|--|
| Frequency | Nature of the occurrence of the residual effect (e.g., how often the stressor impacts the VC) | Once | Residual effect will occur once. |
| | | Rare | 1-2 times per year and intermittently |
| | | Uncommon | 3-5 times per year and intermittently |
| | | Frequent | More than 5 times per year or for extended periods |
| | | Continuous | Continuous or ongoing |
| Reversibility | Potential for the effect to be reversed or naturally return to baseline level after the disturbance has ceased (or following a period of time after the disturbance has ceased) | Reversible | Existing conditions will be restored after effect has ceased |
| | | Irreversible | Existing conditions will not be restored after effect ceases |
| | | Change | Effect may fluctuate between positive and adverse for the duration |
| Likelihood | Likelihood that the residual effect may occur | Low | Likelihood of residual effect is less than 25%. |
| | | Moderate | Likelihood of residual effect is between 25% and 75%. |
| | | High | Likelihood of residual effect is greater than 75%. |

5.4.5.1.1 Changes to Farm Parcel Boundaries

Changes to farm parcel boundaries resulting from the Project will be limited to three farm fields; however, parcel boundary changes can potentially affect the viability of these farm operations. This is primarily related to changes in field size and configuration or shape, which can make it challenging to farm a parcel.

A summary of criteria ratings to determine the significance of changes to farm parcel boundaries and field configurations on agricultural use is provided in **Table 5.4-11**. In general, boundary changes will reduce the agricultural viability of some individual farms that are directly affected by the Project by permanently changing the configuration of fields and reducing their land base. Boundary changes are not expected to affect agricultural viability of lands outside of the areas that overlap with the Project alignment.

Table 5.4-11 Summary of Criteria Ratings for Changes to Farm Boundaries

| Criteria | Criteria Rating | Rationale for Criteria Rating |
|---------------|-----------------|---|
| Direction | Adverse | Changes to farm parcel boundaries may result in adverse effects on individual farm viability due to revised field configuration and reduced land-base. |
| Magnitude | Moderate | Effects may affect viability of the farm configuration on one farm and potentially affect the viability of other individual farms. Three individual farms fields will be directly affected. |
| Extent | Limited | Changes to farm parcel boundaries are limited to directly affected farm properties. |
| Duration | Long term | Changes to farm parcel boundaries are considered permanent since the affected areas will be used for expansion of Highway 99, and upgraded drainage and utility infrastructure. |
| Frequency | Once | One-time change in farm boundaries. |
| Reversibility | Irreversible | Changes to farm parcel boundaries are considered permanent. |
| Likelihood | High | Based on current Project design concept, the likelihood of changes to three farm parcel boundaries is greater than 75%. |

5.4.5.2 Proponent's Determination of Significance

5.4.5.2.1 Significance Definition

Agricultural use of lands in the LAA and RAA has been subject to pressures from land and infrastructure development for more than 50 years. The existing provincial and local government regulatory frameworks for agricultural land management do not specify quantitative thresholds that, if exceeded, would indicate significant effects. Therefore, the significance definitions for this effects assessment are based on the ability for agricultural land use to continue, consistent with the B.C. Environmental Assessment Office guidelines (B.C. EAO 2013). For an adverse residual effect to be considered significant, one or more of the following conditions would apply:

- It results in one or more farms becoming non-viable as an agricultural business because of land loss, soil damage, long-term alteration of drainage or water supply, or constraints on farm operations.
- The collective effect on individual farms is comparable to an effect that would make a farm business non-viable.
- The geographic extent of residual effects goes beyond farms that directly overlap with Project components and extends into the LAA or RAA such that the additive constraints on agricultural use are detectable.

5.4.5.2.2 Significance Determination

The residual effects on farm parcel boundaries are not considered significant because they affect only three farm fields (Properties #62, #67, and #68; **Appendix A, Figures 1n, 1p, and 1q**) within the Project alignment, and these effects can be offset to a substantive degree. Residual effects on Properties #67 and #68, which are provincially-owned, can be offset by parcel consolidation with adjacent properties. The details of the planned consolidation will be developed with the ALC as part of the process to obtain Project authorization under the ALR Regulation. Project construction/operation on Field #62 would result in the removal of 2.0 ha and leave approximately 7.7 ha in a triangular shape that may create some practical challenges for farming a portion of the parcel. The Ministry will work with the property owner to develop mitigation measures to ensure the property remains as a viable farm.

5.4.5.3 Confidence and Risk

Prediction of confidence was based on the assumption that the alignment shown on **Appendix A** is a reasonably accurate representation of the Project footprint, that the information obtained from farm owner/operator meetings is reliable, and that the recommended mitigation measures will be implemented. With respect to mitigation measures, the confidence associated with the effectiveness of the mitigation measures is that most have been tested on other highway projects in B.C. by the Ministry, with proven success.

Low, moderate, or high confidence reflects the level of uncertainty associated with determinations of likelihood and significance. The level of confidence in the effects prediction for agricultural use, associated with both the significance determination and the likelihood, is high because the final project footprint will be subject to only very minor revisions during detailed Project design.

Given the confidence level in the effects prediction and the anticipated negligible residual effects, risk is determined to be low and risk analysis is not required (see methods **Section 3.9 Confidence and Risk**).

5.4.5.4 Summary of Residual Effects

Changes to farm parcel boundaries can affect the viability of a farm operation by making the remaining area of the parcel too small to be farmed and/or by resulting in a shape that is impractical for farm machinery to operate. Residual effects associated with farm parcel boundary changes will be limited to three farm fields (Properties #62, #67, and #68; **Appendix A, Figures 1n, 1p, and 1q**) located in Delta. These residual effects can be largely offset by consolidating the parcels with adjacent properties, such that the parcels can continue to be farmed. Based on this, Project-related residual effects related to change in farm parcel boundaries is assessed to be not significant.

5.4.6 Cumulative Effects

As discussed in **5.4.5**, the only residual effect of the Project on agricultural use is changes to farm parcel boundaries on three farm parcels. Influence of this residual effect on agricultural viability can largely be mitigated through consolidation with adjacent properties such that the impact to the overall agricultural viability of these farm operations is minor.

The residual effect to the three parcels was compared to the Project inclusion list in **Section 3.10.1 Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities**, with particular attention to the spatial overlap of these projects. No overlap or interaction is expected; thus, no cumulative effects are expected to occur that will further contribute to the reduction of agricultural viability of these farms.

5.4.7 Follow-up Strategy

An Agriculture Management Plan will be developed and implemented as part of the construction and operations-phase environmental management plans (CEMP and OEMP, **Section 12.0 Management Plans**). The plan will include a monitoring program and the involvement of qualified professional environmental monitors (e.g., Professional Agrologists). Where soil stockpiling activities are required (such as topsoil recovery and in temporary laydown areas located in the ALR), an environmental monitor will be present during soil salvaging operations to

ensure that soils are salvaged and stockpiled appropriately and to record volumes of salvaged material. Stockpiled soils will include erosion protection measures and will be inspected after heavy rainfall events to ensure erosion and sedimentation measures are effective.

Reclamation plans will be prepared for all temporary work areas and following restoration, the temporary work areas will be inspected by qualified professionals to ensure compliance with the reclamation plans.

Erosion and Sediment Control Plans will be prepared during detailed design of the Project, and qualified professionals will monitor the installation and operational effectiveness of sediment and erosion control structures and measures.

The Project team will work with municipal staff and individual farm operators to schedule relocation or disruptions of highway ditches that also serve as drainage/irrigation ditches to periods when potential effects on farming operations will be minimal. The environmental monitor will also inspect field drainage ditches on affected properties to make sure that this network continues to function properly during construction. This will include regular consultation with affected property owners, particularly during the growing season, to ensure that ditches are functioning properly and that fields are not being flooded or damaged. The environmental monitor will also ensure farm access to the existing ditches (for irrigation), or the new ditches, when sufficient water is available in the ditch system during the irrigation season.

Following Project construction, on-going monitoring will be conducted to ensure reconstructed ditches are functioning as intended. During this period, follow-up meetings with affected property owners will be held to address any outstanding issues related to drainage and irrigation.

Agricultural Capability Class Descriptions

| Class | Description |
|-------|---|
| 1 | No significant limitations in use for crops. |
| 2 | Moderate limitations that restrict the range of crops or require moderate conservation practices. |
| 3 | Moderately severe limitations that restrict the range of crops or require special conservation practices. |
| 4 | Severe limitations that restrict the range of crops or require special conservation practices. |
| 5 | Very severe limitations that restrict capability in producing perennial forage crops, and improvement practices are feasible. |
| 6 | Capable only of producing perennial forage crops, and improvement practices are not feasible. |
| 7 | No capacity for arable culture or permanent pasture. |

5.5 Visual Quality Assessment Overview

- The new bridge will add noticeable visual features to the landscape and will change visual conditions adjacent to the Project alignment. Replacement of interchanges also has the potential to change visual conditions at these locations.
- At distances greater than one kilometre, the bridge deck will merge with the natural landscape and the main visual features will be the bridge towers.
- Vegetated buffers will minimize visual effects to residential developments within close proximity to the bridge in Delta.
- Changes in visual quality at interchanges will be minor as visual quality in such areas is currently influenced by existing transportation infrastructure.
- No significant Project-related residual or cumulative effects on visual quality are expected.

5.5 Visual Quality

This section presents the results of the assessment of potential effects of the Project on visual quality, and includes a description of existing conditions, potential Project-related effects and proposed mitigation measures, and an evaluation of residual Project-related and cumulative effects.

The Project will introduce new visual features to the landscape that have the potential to change local and regional visual conditions; construction of the new bridge and upgraded interchanges (Westminster Highway, Steveston Highway, and Highway 17A).

A visual quality assessment was undertaken to evaluate the potential effects of these changes. The findings in this assessment are subjective as different viewers will have different opinions of the aesthetics of the new bridge and interchanges in relation to the landscape. A method based on the application of qualitative visual quality classifications has been used as a framework for assessment of these effects.

5.5.1 Context and Boundaries

This section describes the context for assessment of Project-related effects on visual quality in terms of Project setting and defines the spatial and temporal assessment boundaries. The rationale for selecting the chosen assessment boundaries is also provided.

No jurisdictional, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects, or accessibility constraints or gaps in data that could limit the ability to predict the effects of the Project were identified; therefore, administrative or technical boundaries are not considered.

5.5.1.1 Assessment Context

Visual Quality Objectives are established through the *Government Action Regulation*, B.C. Reg. 582/2004, to the *Forest and Range Practices Act*, S.B.C., 2002, c. 69. Visual Quality Objectives identify levels of scenic quality based on physical characteristics and social considerations for a given area.

No provincially-designated scenic areas exist in the Project or surrounding assessment areas, and there are no Visual Landscape Inventory classifications for the Project alignment or surrounding areas. The Visual Landscape Inventory rating for the area is listed as Unclassified (DataBC 2014).

Visual quality was selected as a valued component (VC) due to its importance to Aboriginal Groups, the public, and other stakeholders, as evidenced in the feedback received during pre-Application consultation on the Project. During consultation, Aboriginal Groups expressed an interest in visual disturbance to the cultural landscape, in the context of potential change in quality of experience tied to traditional uses. Additional information on the selection of visual quality as a VC is provided in **Section 3.1 Issues Scoping and Selection of Valued Components** and **Appendix A**. Potential influence of the Project on cultural landscape and associated effects on quality of experience tied to traditional uses are discussed in **Part C-Section 10 Aboriginal Consultation** of this Application

5.5.1.2 Methodology

The assessment of visual quality follows the general methodology described in **Section 3.0 Assessment Methodology** and applied to all VCs. The assessment of visual quality is primarily focused on the new bridge, which will introduce tall infrastructure into the landscape and change visual conditions from nearby residential and recreational areas. In addition, visual impact assessments for the Westminster Highway, Steveston Highway, and Highway 17A interchanges are also included.

Visual conditions represent daytime viewing opportunities as seen from selected viewpoints and are evaluated in terms of the colour, shape, texture, and scale of anthropogenic features in relation to characteristics of the natural environment.

For the new bridge, change in visual quality from sensitive locations was used as an indicator to assess trends of visual quality and evaluate potential Project-related effects. This provides a qualitative classification of the change between existing and post-Project visual quality as seen from a viewpoint.

For interchange upgrades, changes in visual quality were assessed taking into account the nature of the existing visual quality classifications in the general area of the interchanges. This provides a qualitative classification of the change between existing and post-Project visual quality taking into account current and proposed future landscape and land uses.

5.5.1.3 Assessment Boundaries

The assessment boundaries for visual quality are defined below.

Spatial Boundaries

The local assessment area (LAA) for visual quality is defined as the area within a six-kilometre radius centered on the highest point of the new bridge deck, as shown on **Figure 5.5-1**. This distance represents views of the new bridge as seen in the foreground and mid-ground from various viewpoints.

The boundaries of the assessment area encompass the area within which the bridge portion of the Project is expected to interact with and potentially have an effect on visual quality. This selection was based on the nature and characteristics of existing visual quality in relation to the maximum extent of potential effects as a result of the bridge and interchanges.

The Westminster Highway interchange is located immediately north of the LAA. Modifications to this interchange are expected to be minor and only visible from the immediate surrounding area. Thus, the study area for upgrades to this Project component is the immediate area surrounding the interchange. The Steveston Highway and Highway 17A interchanges are contained within the LAA.

No regional assessment area has been defined because in a flat landscape, such as in City of Richmond (Richmond) and Corporation of Delta (Delta), beyond six kilometres the views of the bridge and interchanges will be mostly screened by intermediate structures and vegetation. If the bridge is visible outside the LAA, it will be from elevated locations and will be in the background rather than forming a substantial element of the viewscape.

Temporal Boundaries

Temporal boundaries for the assessment of Project-related effects on visual quality were established based on the potential for each phase of the Project to interact with and have an effect on visual quality. As discussed in **Section 3.1 Issues Scoping and Selection of Valued Components**, both the construction and operational phases of the Project include components and activities that could interact with and affect visual quality within the Project alignment; therefore, the following temporal boundaries were defined for the visual quality assessment:

- Existing conditions
- Project construction (including Tunnel decommissioning)
- Project operation (including maintenance)

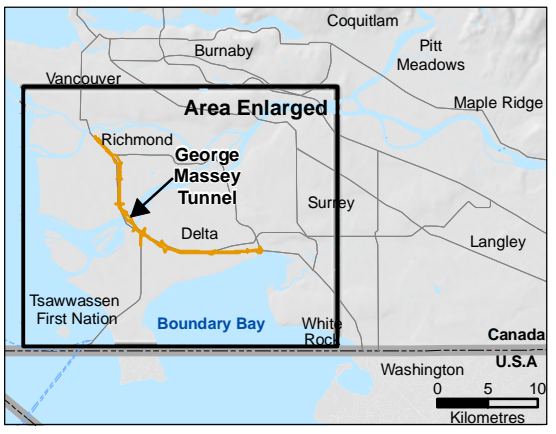

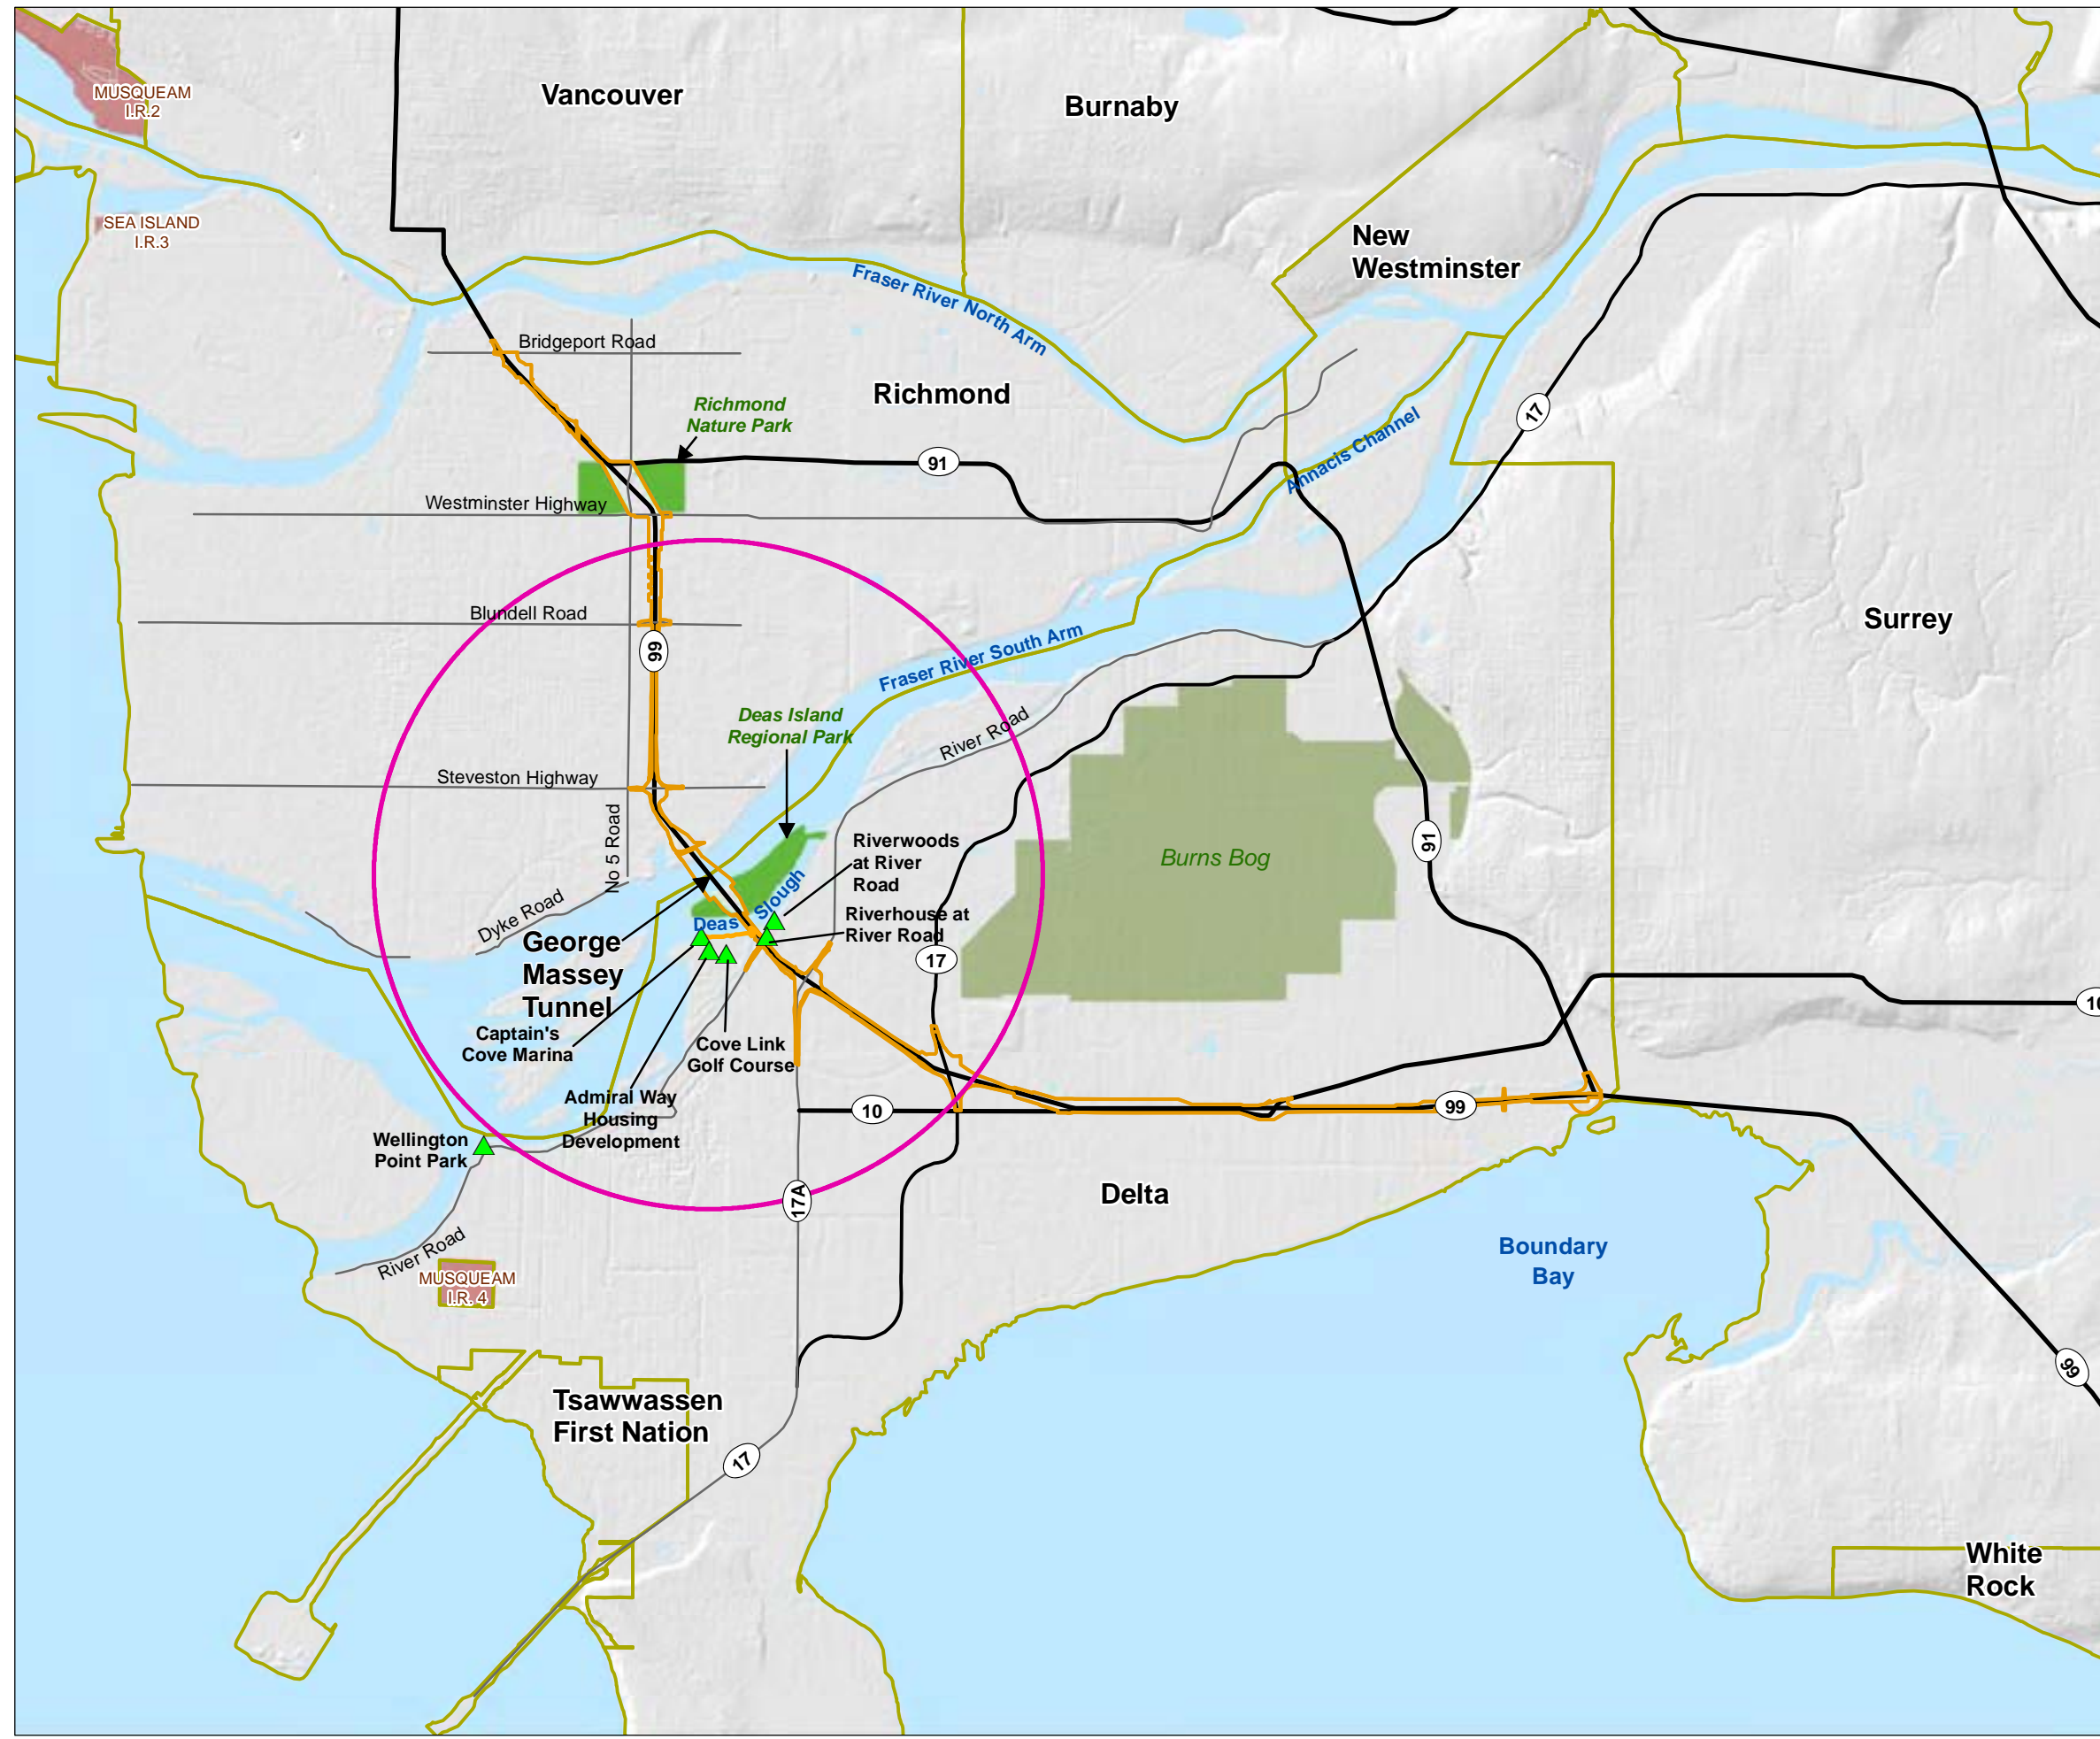

Temporal characteristics of the Project phases are discussed in **Section 1.1 Description of Proposed Project**. Specific temporal considerations for the assessment of visual quality and its sub-components are discussed in the context of Project interactions and potential effects in **Section 5.5.4**.

Administrative Boundaries

No political, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects on visual quality have been identified; therefore, no administrative boundaries are defined.

Technical Boundaries

Established visual quality objectives and scenic area designations, as well as procedures and standards for conducting visual quality assessments, are geared towards non-urban forestry applications. These have been adjusted, based on information from comparable past projects, to meet the needs of Project-related visual quality assessment. No other technical boundaries have been identified that could influence the assessment of potential Project-related effects on visual quality.

5.5.3 Existing Conditions

This section provides an overview of the methodology for collecting baseline data, and describes the existing conditions of visual quality within the assessment areas. An overview of the regulatory context for management of visual quality as relevant to the Project is also provided.

5.5.3.1 Baseline Data Collection

In 2014, the Ministry initiated visual quality studies to support Project planning and environmental assessment. Building on available information, these studies were designed to:

- Identify an appropriate approach for assessing potential effects of the new bridge.
- Document existing visual conditions at viewpoints selected to represent sensitive receptors (e.g., residents).

Desktop and field studies conducted with respect to visual quality are summarized in **Table 5.5-1** and described in detail below.

Table 5.5-1 Desktop and Field Studies Related to Visual Quality

| Study Name | Purpose of Study |
|----------------|--|
| Desktop review | <ul style="list-style-type: none">• Identify existing management objectives.• Identify the appropriate method for assessing the effects of the Project on visual quality. |
| Field studies | <ul style="list-style-type: none">• Characterize and document the existing conditions at viewpoints selected to represent sensitive receptors. |

Visual Conditions

A review of relevant government documents and databases was undertaken to determine what management objectives for visual quality may already exist. The provincial Visual Landscape Inventory map layer, available through iMapBC (DataBC 2014), revealed no provincially established visual quality objectives within a six-kilometre radius of the new bridge. A review of the local government (Richmond and Delta) websites did not identify any applicable plans or policies regarding the protection of visual quality in the LAA.

A review of the existing information and the state of knowledge pertaining to visual quality assessment was undertaken to identify the appropriate analysis methods for the Project. The Province has established criteria for conducting visual quality effectiveness evaluations (*Protocol for Visual Quality Effectiveness Evaluation*, B.C. MOF 2008). These methods are based on, and used for, non-urban forestry applications, with only peripheral utility for infrastructure projects in urban settings. As such, provincial methods informed this study; however methods used for recent visual quality evaluations on similar infrastructure projects nearby and across North America are considered more relevant. This approach is considered appropriate for this assessment, as the Project is located within an already developed urban corridor, within a substantially altered visual landscape.

Studies for the Port Mann/Highway 1 Improvement project (B.C. MOTI 2007), Deltaport Third Berth project (VPA 2005), Deltaport Terminal Road and Rail Improvement project (PMV 2012), and the California Incline Bridge Replacement Project (ICF Jones and Stokes 2010) were deemed most relevant to the Project. For the interchanges, the method was adjusted to account for differences in the modification of existing interchange structures versus those applied to the visual assessment of the new bridge, which represents a new element in the local and regional viewscape.

No formal attributes exist for visual quality indicators in the urban setting as they do for rural areas (i.e. crown land scenic areas). For the assessment of visual resources, the methodology used to establish baseline conditions is based on a rating system for visual sensitivity.

A key step in the visual quality assessment was determining visual sensitivity for the Project alignment, which is the overall sensitivity of the viewscape to human alteration as measured by visual sensitivity class (B.C. MOF 1997). A viewscape is the visual connection between a person and the spatial arrangement of natural and urban landscape features that they are viewing. The visual sensitivity class rates the likelihood that new or additional human alteration within a viewscape would elicit some degree or type of criticism or concern. This could be of an economic nature (e.g., adverse effect on a tourism operation) or a social nature (e.g., adverse effect on a public recreation opportunity or the public's enjoyment of an existing natural or previously altered viewscape). The visual sensitivity class is defined for the object of the view, in this case the new bridge, rather than for each viewer or viewpoint, and provides the context for the assessment.

Based on professional judgement and experience from other projects, and drawing from the visual sensitivity classes and definitions in **Table 5.5-2**, a visual sensitivity rating, from perspective of typical viewers, has been assigned for the Project. At one end of the spectrum, viewers who can see a change in visual conditions from their residence would have a relatively high sensitivity to the change. At the other end of the spectrum, typical commuters driving

through an area to and from work are presumed to have a low level of sensitivity because they perceive the landscape in a different manner from those viewing it for pleasure. Pedestrians, tourists, and motorists who view the landscape as part of a recreational activity would likely have a moderate sensitivity. The perspectives of all viewer types are considered when selecting a visual sensitivity class (VSC) to rate the viewscape.

Table 5.5-2 Visual Sensitivity Classes and Definitions

| Visual Sensitivity Class | Description |
|--------------------------|---|
| Very High | Views of and from the area are managed through public regulations and plans. The public has great potential to react strongly to small modifications in the viewscape because the affected views are unique or special to the region or locale. |
| High | The viewscape includes distinctive qualities that are important to viewers. There is considerable potential for public concern over major changes in the viewscape. |
| Moderate | The affected views may be secondary in importance or are similar to other views commonly available to the public. Noticeable changes may be tolerated by the public if the distinctive qualities of the viewscape remain dominant. |
| Low | The views are seen by a small minority of the public who may have concerns about additional changes to the viewscape, which has been subject to constant change. |
| Very Low | The affected views are either not publicly assessable or there are no indications that the visual resources within the potentially affected viewscape are valued by the public. |

Note: Adapted from B.C. Ministry of Forests (1997).

Field surveys were completed to characterize the existing viewscape from select viewpoints. Viewpoints were identified based on local knowledge and experience, giving consideration to residential as well as recreational areas (e.g., municipal parks). Field work was conducted during clear, sunny days to provide optimal viewing conditions. Each viewpoint was visited twice between May and September 2014, or on August 15 or 17, 2015. Photographs were taken from each viewpoint using a Nikon D7100 with a 200 mm zoom set at 18 mm.

Another purpose for the field visit was to determine a baseline visual quality class (VQC) of the viewscape from each viewpoint. The VQC is a qualitative rating based on visual characteristics that describe the existing level of human development in the area being viewed. The five-point classification scheme used in this assessment is based on the *Protocol for Visual Quality Effectiveness Evaluation* (B.C. MOF 2008) and presented in **Table 5.5-3**.

Table 5.5-3 Visual Quality Classes and Definitions

| Visual Quality Class | Definition |
|----------------------|---|
| Preservation | <ul style="list-style-type: none"> • Largely natural landscape. • Any human development on the landscape is very small in scale. |
| Retention | <ul style="list-style-type: none"> • Mostly natural landscape. • Any human development on the landscape is difficult to see and small in scale. |
| Partial Retention | <ul style="list-style-type: none"> • Part of the landscape is natural. • Human development is easy to see and is small to medium in scale. |
| Modification | <ul style="list-style-type: none"> • The natural landscape is marginally present. • Human development is very easy to see and large in scale. |
| Maximum Modification | <ul style="list-style-type: none"> • Human development dominates the landscape. |

Note: Adapted from Protocol for Visual Quality Effectiveness (B.C. MOF 2008).

A general assessment of the visual quality at interchange locations was conducted. This reflects the generally lower visual sensitivity class at the interchanges where existing development, including the presence of transportation infrastructure, commercial properties reliant on transportation, and agriculture are prevalent. The existing visual conditions in the landscape, including the presence of interchanges, is considered consistent with the existing land uses in the Highway 99 corridor.

The assessment considers potential changes in visual conditions at interchanges against visual sensitivity and visual quality classification criteria including:

- Proximity to existing residential and recreation areas.
- Relative change from existing infrastructure including elevations of proposed works.
- The existing visual environment.

5.5.3.2 Regulatory Context

In B.C., Visual Quality Objectives are established through the *Government Action Regulation*, B.C. Reg. 582/2004 under the *Forest and Range Practices Act*, S.B.C., 2002, c. 69. Visual Quality Objectives identify levels of scenic quality based on physical characteristics and social considerations for a given area. No provincially-designated scenic areas are located in the visual quality assessment area for the Project.

Richmond, Delta, and Metro Vancouver do not have specific plans or policies on the protection of cultural landscapes, view corridors, or other visual resource values that are applicable to the Project alignment.

5.5.3.3 Existing Conditions

The Project traverses the Fraser River South Arm, which flows westerly through a relatively flat landscape that has been extensively modified by human activity (e.g., agriculture, river training, road, rail and air transportation, commercial and residential). In addition to the river, Highway 99 is also a prominent visual feature and includes the highway, interchanges, and the existing infrastructure associated with the Tunnel.

The Highway 99 alignment is largely surrounded by agricultural and recreational areas, with clusters of residential, commercial, and industrial development nearby. Mature vegetation is present around older developments, in larger parks, and along the river banks. Detailed description of existing land uses is provided in **Section 5.3 Land Use**. Most residential and commercial developments adjacent to Highway 99 exist in close proximity to the existing interchanges and have developed in parallel to growth in population in the adjacent municipalities since the Tunnel opened in the 1950s, and earlier when the route was served by a ferry crossing on the Fraser River.

Within the LAA, Highway 99 connects Richmond and Delta through the existing four-lane Tunnel that passes under the Fraser River South Arm from the south shore of Lulu Island and emerges on Deas Island. South of the Tunnel, the Deas Slough Bridge carries traffic over Deas Slough. From there, Highway 99 continues to the Canada–U.S. border. Further details of the Project context are provided below.

Lulu Island: At the north end of the proposed new bridge, there are several areas of agricultural land holdings with a commercial farm market to the east. To the west of the new bridge are commercial developments and residential properties. Richmond's south shore (of the Fraser River) is characterized by industrial development, immediately adjacent to and on either side of Highway 99. Further to the west, a pedestrian and cycling trail follows the Fraser River shoreline.

Fraser River: The Fraser River is a notable visual feature in Metro Vancouver, with cultural, commercial, and recreational values. Views of the river and marine traffic are available upstream and downstream of the current Highway 99 corridor crossing. With the exception of Deas Island Regional Park and Finn Slough, a small historic fishing village at the south end of No. 5 Road in Richmond, none of these view locations are specifically managed for recreation. The Fraser River channel is heavily used by commercial and industrial traffic, commercial and recreational fishing vessels, and recreational boats.

Deas Island: The Tunnel entrance and exit on Deas Island is surrounded by Deas Island Regional Park. The park encompasses all of Deas Island with the exception of the land allotted to the Highway 99 ROW, and it offers recreational trails, tidal fishing areas, aquatic recreational areas, and heritage buildings. Along the south shore of Deas Slough in Delta, there are various recreational, residential, and commercial developments, including the recreational Millennium Trail. The trail connects Deas Island Regional Park to downtown Ladner and provides access to scenic viewpoints, recreational fishing areas, historical structures, and park amenities.

5.5.3.4 Selected Viewpoints

No provincial visual quality objectives have been assigned within the LAA. However, public consultation conducted for the Project indicates that there are visually important areas within the LAA (i.e., high VSC). These include residential areas, restaurants, marinas, parks, trails, golf courses, and beaches. During pre-Application consultation activities for the Project, Aboriginal Groups noted that a historical village, Tle'tinus (also Tq'ltinus and Tl'uqtinus), was located within 5 km of the Project, with associated harvesting areas as well as areas used for bathing and spiritual practices. Commenters noted that this village “was a major trade centre and the elders called it little New York”, and that an area in proximity to this village site exists where one of the practices was bathing, mourning, and spiritual practices. Harvesting areas were also identified to have occurred near the village site. A viewpoint (see Viewpoint 17 in **Section 5.5.3**) was selected to represent this location, which also has visual quality aspects for recreational use.

Based on potential visibility of the new bridge alignment and informed by public consultation, 17 viewpoints were selected to represent sensitive receptors in the LAA (**Figure 5.5-2**). The viewpoints selected represent areas identified as having the greatest potential for change for individuals using such areas and include areas with residential development, in close proximity to the bridge, and areas that attract recreational activities linked to the large rural areas and natural values in the Project area (e.g., river, agricultural land, wildlife values).

A brief overview of the setting of the selected viewpoints is provided in **Table 5.5-4**.

Table 5.5-4 Viewpoint Location and Description

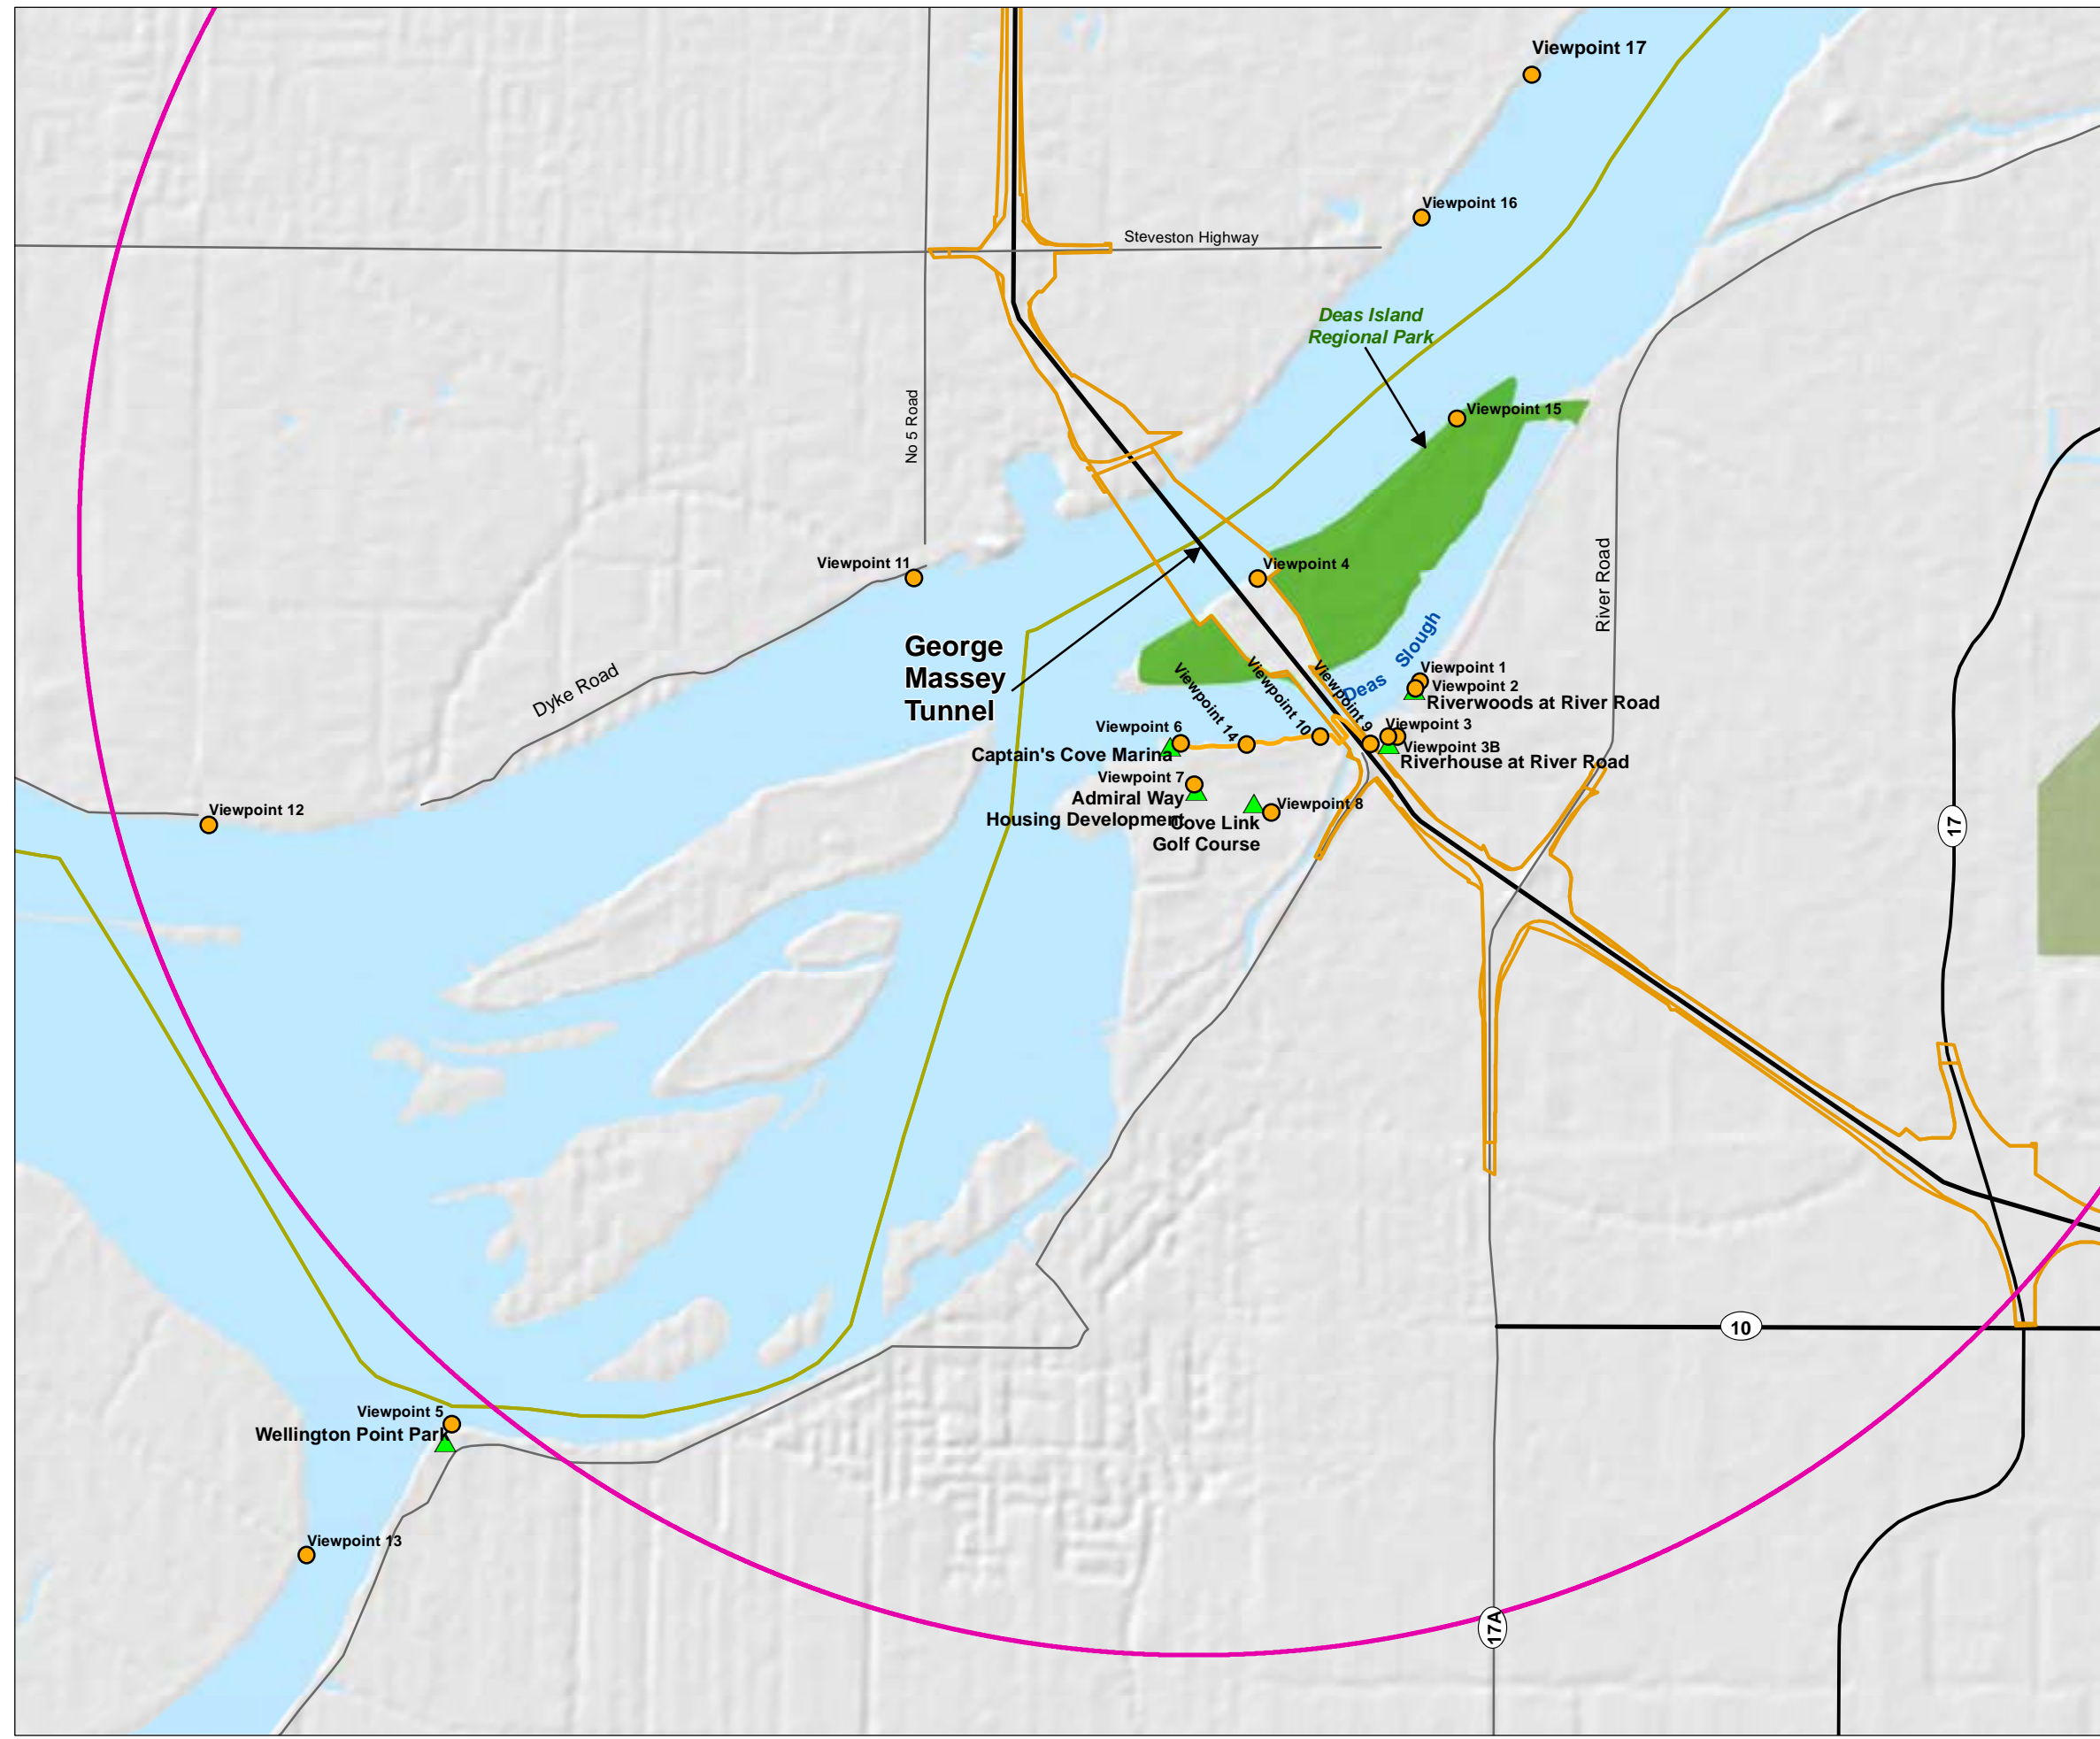

| Viewpoint ID | Location Description | Distance to Project (m)¹ |
|---|--|--|
| Viewpoint 1: River House Restaurant and Marina | Located near River House Restaurant and Marina, less than one kilometre southeast of the Tunnel entrance on Deas Island, in Delta. A large number of people access this location via vehicle, boat, and by cycling or walking on the Millennium Trail. | 1,200 |
| Viewpoint 2: River House Restaurant and Marina | Located southwest of Viewpoint 1 on the Millennium Trail. | 1,200 |
| Viewpoint 3: River Woods neighbourhood | Located within the River Woods neighbourhood at River Road, in Delta, the neighbourhood consists of a 21-unit residential complex built in 2005, situated between River House Restaurant and Marina to the east and Highway 99 to the west. The Millennium Trail runs along the property. The existing views of the Highway 99 right-of-way (ROW) are screened by over 30 m tall deciduous trees to the north and west of the complex. This viewpoint is located in the centre of the neighbourhood, on the street facing northwest towards the ROW. | 1,270 |
| Viewpoint 3B: River Woods neighbourhood | Located in River Woods neighbourhood, this viewpoint represents a backyard view of the Highway 99 ROW, partially screened by vegetation, from between two housing units. | 1,240 |
| Viewpoint 4: Tunnel Access Road (south side) | Located in Deas Island Regional Park, in Delta, near the Tunnel entrance. This viewpoint is accessible via a road intended primarily for use by emergency vehicles and maintenance trucks, but it is open for public access. | 340 |
| Viewpoint 5: Wellington Point Park | Located in Wellington Point Park, near River Road West, in Delta. The park is located about five kilometres to the southwest of the new bridge location and contains trails, recreational fishing areas, historical structures, and other park amenities. This location has a boat launch, picnic tables, and parking. | 5,180 |

| Viewpoint ID | Location Description | Distance to Project (m) ¹ |
|--|--|--------------------------------------|
| Viewpoint 6: Captain's Cove Marina | Located at Captain's Cove Marina, in Delta. The marina is adjacent to Deas Slough, less than one kilometre southwest of the Tunnel entrance on Deas Island. The marina is a commercial development used by commercial and recreational users. It is about 150 m north of Cove Links Golf Course. | 910 |
| Viewpoint 7: Admiral Way, south of Captain's Cove Marina | Located at the residential development in Ladner on Admiral Way and Ferry Road, in Delta. This residential development is situated near Captain's Cove Marina, and adjacent to Cove Links Golf Course, with views of the Fraser River to the north. | 1,100 |
| Viewpoint 8: Cove Links Golf Course | Located at Cove Links Golf Course, in Delta. This nine-hole golf course is surrounded by several residential developments. | 1,270 |
| Viewpoint 9: Millennium Trail between River Woods and Highway 99 | Located along the Millennium Trail, in Delta, on the south shore of the Fraser River and Deas Slough, this viewpoint was selected for its proximity to the River Woods neighbourhood and frequency of use. | 1,210 |
| Viewpoint 10: East of Captain's Cove Marina | Located beside the existing Deas Slough Bridge, this viewpoint was selected due to the future housing development currently under construction adjacent to the location. | 1,050 |
| Viewpoint 11: Benches on Dyke Road (West of No.5 Road) | Located along an off-street unpaved path paralleling Dyke Road, just west of the south end of No.5 Road in Richmond. The trail is an informal pedestrian and cycling trail that follows Dyke Road and forms part of the Richmond Trails network. This part of the trail is near benches, offering clear views of the Fraser River South Arm. | 1,270 |
| Viewpoint 12: No.3 Road and Dyke Road (dog park and public pier) | Located near the Dyke Trail Dog Park east of a public pier in Richmond. The trail runs along the Fraser River South Arm and is well-used for walking and cycling. The trail also includes benches along the river. As part of the Richmond Trails network, this viewpoint is a popular location for year-round fishing. | 4,600 |

| Viewpoint ID | Location Description | Distance to Project (m) ¹ |
|--|--|--------------------------------------|
| Viewpoint 13: Westham Island Road near the single-lane bridge | Located near Westham Island Road, in Delta, this viewpoint represents a travel corridor and is near the single-lane bridge that connects Westham Island to Delta. The Alaksen National Wildlife Area and George C. Reifel Bird Sanctuary are located on the northwest corner of the island. This location was chosen due to the large number of visitors that use Westham Island Road to access the George C. Reifel Bird Sanctuary. | 6,040 |
| Viewpoint 14: Millennium Trail beside Captain's Cove | Located along the Millennium Trail, west of the Project, this viewpoint was chosen because of the frequency of use observed during field studies. | 950 |
| Viewpoint 15: Deas Island Regional Park Lookout | Located on the northwest corner of Deas Island Regional Park, in Delta, this viewpoint was selected as it is a popular lookout of the Fraser River South Arm along the Tinmaker's Walk trail within the Riverside Picnic Area. | 1,300 |
| Viewpoint 16: Waterstone Pier residential complex | Located adjacent to Waterstone Pier residential complex along Riverport Way in Richmond, on the southeast bank of the Fraser River at No. 6 Road and Steveston Highway. The complex was built in 2006 and consists of three four-story buildings containing a total of approximately 140 units. This viewpoint represents the view of the Fraser River from the perspective of a pedestrian walking on the path adjacent to the complex. | 1,770 |
| Viewpoint 17: Dyke and Williams Road | Located near the corner of Dyke and Williams Rd. This area is an unofficial parking lot on long the north side of the Fraser River. This viewpoint represents the view from a walking area to the west of the parking lot. This area also represents the view from the historical village Tle'tinus (also Tq'ltinus and Tl'uqtinus) that has been identified by Aboriginal Groups as culturally important area. | 2,560 |

Notes: 1. Straight-line approximate distances from each viewpoint to the center point of new bridge, estimated from Figure 5.5-2.

5.5.3.5 Existing Visual Quality

New Bridge

Existing VQC of the viewscape from selected viewpoints, shown on **Figure 5.5-2**, are presented in **Table 5.5-5**. The viewpoints with the least visual alteration from human development are Viewpoint 5 (Wellington Park), and Viewpoint 13 (Westham Island Road near the one-lane bridge). Currently Viewpoints 5 and 13 have a VQC rating of Retention since predominant views from this location are of natural features and any human development on the landscape is difficult to see and of small and scale.

The remaining viewpoints have existing views of marinas, housing, commercial or industrial buildings, integrated with views of natural vegetation and the Fraser River. The existing viewscape from these viewpoints have a VQC rating of Partial Retention, Modification, and Maximum Modification. The Deas Slough Bridge can be clearly viewed in the mid-ground from Viewpoint 9 (Millennium Trail) and from Viewpoint 10, east of Captain's Cove Marina. The Deas Slough Bridge is screened from direct view by mature vegetation from Viewpoint 14 as this low elevation bridge merges with adjacent topographic features. Viewpoint 17 has an existing view of a vacant industrial lot and jetty together, with views of natural vegetation along Deas Island, along the south side of the Fraser River.

The viewpoints with the most visual alteration to their viewsapes from human development are Viewpoint 1 (River House Restaurant and Marina), Viewpoint 2 (River House Restaurant Marina), Viewpoint 6 (Captain's Cove Marina), Viewpoint 7 (Admiral Way, south of Captain's Cove Marina), Viewpoint 8 (Cove Links Golf Course), Viewpoint 9 (Millennium Trail between River Woods and Highway 99), Viewpoint 10 (East of Captain's Cove Marina), Viewpoint 11 (Benches on Dyke Road (west of No.5 Road), Viewpoint 14 (Millennium Trail beside Captain's Cove), Viewpoint 15 (Deas Island Regional Park Lookout) and Viewpoint 16 (Waterstone Pier residential complex). The viewsapes from these viewpoints have a VQC rating of Maximum Modified since human development dominates the views.

Table 5.5-5 Viewpoint Locations and Existing Visual Quality Class of Viewscape

| Viewpoint | Existing Visual Quality Class |
|--|--------------------------------------|
| Viewpoint 1: River House Restaurant and Marina | Modification |
| Viewpoint 2: River House Restaurant and Marina | Modification |
| Viewpoint 3: River Woods neighbourhood | Partial Retention |
| Viewpoint 3B: River Woods neighbourhood | Partial Retention |
| Viewpoint 4: Tunnel Access Road (south side) | Modification |
| Viewpoint 5: Wellington Point Park | Retention |
| Viewpoint 6: Captain's Cove Marina | Modification |
| Viewpoint 7: Admiral Way, south of Captain's Cove Marina | Maximum Modification |
| Viewpoint 8: Cove Links Golf Course | Maximum Modification ¹ |
| Viewpoint 9: Millennium Trail between River Woods and Highway 99 | Partial Retention |
| Viewpoint 10: East of Captain's Cove Marina | Partial Retention |
| Viewpoint 11: Benches on Dyke Road (west of No.5 Road) | Modification |
| Viewpoint 12: No.3 Road and Dyke Road (dog park and public pier) | Modification |
| Viewpoint 13: Westham Island Road near the single-lane bridge | Partial Retention |
| Viewpoint 14: Millennium Trail beside Captain's Cove | Modification |
| Viewpoint 15: Deas Island Regional Park Lookout | Retention |
| Viewpoint 16: Waterstone Pier residential complex | Modification |
| Viewpoint 17: Dyke and Williams Road | Partial Retention |

Note: 1. Classified as Maximum Modification due to the amount of vegetation that was removed for the new residential development.

The rating system for visual sensitivity is based on potential viewer responses to changes in visual conditions. Viewer response to changes in the viewscape as a result of installing the bridge will be variable. A small number of viewers, including residents, workers, recreationists, and tourists, will experience the changed views over relatively long periods of time, and are assumed to have a high sensitivity to changes in visual conditions. However, the majority of viewers within the LAA are likely to be vehicle drivers or passengers using Highway 99. These short-term users generally have low sensitivity to changes in visual conditions. In addition, the affected views are similar to those available upstream and downstream of the Project alignment. Therefore, the overall visual sensitivity class for the LAA is rated as low, based on the majority of the typical viewers of the views being transient and the availability of similar views nearby.

Other factors that contribute to the low visual sensitivity classification are the relatively flat topography of the area around the new bridge, the mature trees that will limit views of the new bridge from a distance, and the existing level of human alteration in the LAA, which includes the major traffic corridor of Highway 99. In future, with regional population growth and further development, the visual change caused by a new bridge is likely to have a fairly high level of acceptance and low level of concern. Within this context of low visual sensitivity within the LAA, the assessment focuses on the potential effects of the Project on visual quality from the perspective of the most sensitive receptors (i.e. long-term users).

Interchange Upgrades

For all three interchanges, the landscape is currently dominated by human development, both at the existing interchanges and through extensive land use changes for agriculture, commercial, and residential. Naturalised greenspace is marginally present in the surrounding areas, as per the definitions provided in **Table 5.5-3**. However, at Westminster Interchange there is substantial forest in the immediate area around the interchange (Richmond Nature Park). The areas adjacent to the Steveston Highway and Highway 17A interchanges have substantial agricultural, commercial, and residential development adjacent to their right-of-way, which have occurred following the establishment of the Highway 99 corridor. The Westminster interchange, by comparison, has relatively low levels of development in its vicinity. Key features of the existing conditions for the three interchanges where improvements are proposed include the following.

Westminster Highway Interchange

The visual assessment of improvements to the Westminster Highway interchange focused on existing development on Westminster Highway between Sidaway Road to the east and Number 5 Road to the west. Also associated with this is the lane widening activities on the Highway 99 and Highway 91 Interchange to the north, though the changes there are minor and do not result in any substantial changes in the nature of the infrastructure.

Current land use south of Westminster Highway, on both sides of Highway 99, is dominated by agricultural developments many of which include a residence. West of Highway 99, Westminster Highway supports some commercial and residential development. Virtually all development on Westminster Highway is oriented to have north or south facing views rather than viewscapes facing the existing interchange. Northeast and northwest of the existing infrastructure, land use includes forested areas within the Richmond Nature Park where there is recreational use. The existing visual environment is defined by largely undeveloped areas (i.e., Richmond Nature Park and agricultural land) that will remain undeveloped, and transportation infrastructure associated with Highway 99 and Westminster Highway.

The visual sensitivity class in this area is high, reflecting the forest area in Richmond Nature Park, to low, reflecting the existing interchange and overpass structure, maintained rights-of-way and absence of residential areas facing the Project area. The opportunities for visual receptors to view the Westminster Interchange area are low as there are few locations for residential or recreational viewpoints that look toward the highway.

Visual Quality Classification: For Westminster Interchange, the VQC ranges from Partial Retention adjacent to the Richmond Nature Park (i.e., where part of the landscape is natural and human development is easy to see and is small to medium in scale) to Modification in other areas (i.e., where the natural landscape is marginally present and human development is very easy to see and large in scale).

Steveston Highway Interchange

The visual assessment of improvements to the Steveston Highway interchange focused on existing development east of Highway 99 to Sidaway Road and west to Number 5 Road. Current land use on the east side of Highway 99 includes agricultural development north and south of Steveston Highway and commercial produce sales southeast of the interchange. On the west side of Highway 99, land use is primarily commercial and includes auto sales, logistics and transportation businesses to the south and mixed retail and residential to the north.

The closest residential development faces directly onto Steveston Highway and is approximately 100 metres from the southbound off ramp from Highway 99 and 200 m from the centre line and existing over/underpass. The residential development in this area, which is part of a mixed used retail development, has developed in recent years during which time the existing visual conditions have been strongly influenced by transportation activities in the area including the local road network.

The existing visual conditions are influenced by transportation infrastructure including over/underpass and on/off ramps to support north and south bound traffic movements off of Steveston Highway. Eastward views include transportation infrastructure in the foreground and agricultural land beyond the Highway 99 corridor. Due to existing congestion, views in all directions are influenced by the presence of slow moving/congested traffic. The VSC in this area is low to very low, which reflects the presence of existing interchange and overpass structures, prevalence of commercial and industrial areas that are not expected to be influenced by visual changes, and developed agriculture. Given the limited number of residential or recreational viewpoints that look over or toward the highway, opportunities to view the Steveston Interchange area are low. Recent residential developments have views that are dominated by transportation infrastructure.

Visual Quality Classification: for Steveston Interchange, the VQC ranges from Modification in agricultural areas (i.e., where the natural landscape is marginally present and human development is very easy to see and large in scale) to Maximum Modification in other areas (i.e., where human development dominates the landscape).

Highway 17A Interchange

Current land use surrounding the existing Highway 17A interchange is primarily for agricultural development. There is limited commercial or retail development in the area with the closest and primary development being a mixed commercial development (Delta Town and Country Inn), to the east of the existing Highway 99/17A over/underpass. Additional commercial developments exist to the east along 62B Street. The closest residential development in proximity to the existing interchange is approximately 500 m to the north (River Woods) with developments primarily facing the Fraser River and views influenced by the proposed bridge rather than the interchange at Highway 17A.

The existing visual environment directly adjacent to the existing over/underpass is defined by developed agricultural areas, and transportation infrastructure associated with the Highway 99 corridor. There are few to no opportunities for public viewpoints in this area and the visual sensitivity class is considered low.

Visual Quality Classification: In this area, the VQC is considered Modification (i.e., where the natural landscape is marginally present and human development is very easy to see and large in scale).

5.5.4 Potential Effects

This section discusses anticipated interactions of Project components and activities with visual quality, and the potential effects of such interactions. Information on mitigation of potential effects, including Project design measures to avoid adverse effects, is provided in **Section 5.5.4**. Potential residual effects (i.e., effects remaining following the implementation of mitigation measures) are described in **Section 5.5.6**. A discussion of potential for cumulative effects on visual quality is presented in **Section 5.5.7**.

5.5.4.1 Project Interactions

An overview of potential interactions between Project activities and visual resources during the construction and operation of Project components is provided in **Appendix A**. A preliminary evaluation of the potential effects of Project interactions on visual resources, intended to focus the assessment on those interactions of greatest importance, is presented below. Interactions rated as having no effect are not considered further in the assessment.

Construction: While construction activity associated with the bridge and interchanges represents an addition to the visual landscape, these works are temporary and of short duration, therefore, they are considered of negligible magnitude when compared to the more-substantive long-term changes associated with the completed infrastructure during operations. As such, visual effects specific to the construction phase, are not considered further in this assessment.

Operation: Once construction of the new bridge is complete, its towers, piers, and deck will appear as prominent features in a flat, vegetated landscape with a major river channel. The surrounding landscape supports a wide variety of human developments and activities, from recreational to residential, commercial and industrial, along the shoreline as well as inland. Visual quality effects on recreational users during Project operation is discussed in **Section 5.3 Land Use**. The potential effect on quality of experience (i.e., cultural heritage) tied to Traditional Uses due to visual disturbance to the cultural landscape that informs and supports those uses is discussed in **Section 10.0 Aboriginal Consultation**.

The new bridge piers and towers will be situated on the south shore of Richmond and the north shore of Deas Island. The highest point on the deck of the new bridge will be near the centre of the Fraser River South Arm, making it visible over a relatively long distance. On the Delta side, the deck of the new bridge, as it approaches ground level, will be higher, and consequently visible from a greater distance, when compared to the existing Deas Slough Bridge. The supporting piers of the new bridge on Deas Island will also be visible over a greater distance due to their height above the ground. Contrast created by the geometric structure and light colour of the piers against the background vegetation could influence the effect of visual changes.

Modifications of interchanges on Highway 99, at Westminster Highway and Steveston Highway and at Highway 17A, will include changes to existing structures that currently influence visual conditions in these areas. The modified structures will be minimally visible at long distances because the modifications are generally low in elevation and the landscape is flat.

5.5.4.2 Potential Effects

The methodology adopted for this study combined approved visual standards and procedures from the B.C. MOF (1997) and other methodologies used on comparable projects to assess the nature and degree of potential Project-related changes in visual quality.

The assessment involved a qualitative evaluation of the degree to which overall visual quality would change as a result of the Project, and followed the three main steps listed and described in detail below:

- 1. Select and characterize viewpoints:** Seventeen viewpoints with viewsapes that may be sensitive to visual changes resulting from the Project were identified based on local knowledge and experience surrounding the new bridge. Consideration was given to nearby residential and recreational areas. As discussed in **Section 5.5.2** and listed in **Table 5.5-5**, the existing VQC was assigned for the viewscape from each viewpoint. All potential viewpoints were considered for the interchange upgrades.
- 2. Simulate future visual conditions:** To identify Project-related changes in visual conditions from the selected viewpoints, simulations of the potential views with the new bridge were created using AutoCAD design and drafting software. To create the simulations for each viewpoint, photographs of existing landscape features taken from the viewpoints were incorporated into AutoCAD, along with elevation data (height contours) of the surrounding landscape, and reference concept drawings of the new bridge.

The result is a realistic three-dimensional visual simulation of the views with the new bridge as seen from each viewpoint. The simulated views present what would be seen at the time of the day when the original viewpoint photos were captured. For each viewpoint, features of reference that are in close proximity to the new bridge and visible from the viewpoint were identified and annotated on maps (**Figure 5.5-2**). The new bridge and the reference points were combined within the software to create the simulations.

Aerial views of each of the interchanges were rendered using AutoCAD to include the interchange upgrades. These renderings provide an overhead view of the locations of the upgrades and provide a perspective to assess surrounding viewpoint locations.

- 3. Assess effects:** The simulations with the new bridge in place were used to rate the future VQC from each viewpoint, based on the classifications defined in **Table 5.5-3**. The anticipated future VQC ratings were compared with the VQC ratings under existing conditions to determine changes in visual quality expected as a result of the Project. Those changes were reviewed in the context of overall sensitivity of the viewscape to alteration, as measured by VSC (B.C. MOF 1997).

New Bridge

The potential effect of the new bridge on visual quality is characterised as increased visibility of anthropogenic features and variable change in VQC rating, as seen in the visual simulations for each viewpoint. Existing and potential views from each of the viewpoints (**Table 5.5-4**), along with their VQC ratings (**Table 5.5-3**), are presented in **Table 5.5-6**. High resolution images of the existing conditions and simulated future conditions with the Project are provided in **Appendix B**.

Existing views from the majority of the viewpoints include small-scale anthropogenic features such as marinas and low-rise buildings in the foreground or mid-ground, which provide visual interest. The scale and characteristics of these features blends in with the surrounding mature vegetation. Views that include Deas Slough and the Fraser River provide additional interest.

Given the relatively flat topography of the Fraser River delta, construction of the new bridge will introduce prominent visual features into existing viewscales. The new bridge will be of a much larger scale, both in height and width, than the existing roadway and Deas Slough Bridge.

Viewscales from Viewpoint 9 (Millennium Trail between River Woods and Highway 99) and Viewpoint 10 (east of Captain's Cove Marina) will experience the most change as a result of the new bridge. The VQC ratings of the viewscales from these viewpoints are likely to change from Partial Retention to Maximum Modification once the new bridge is in place. The views from these locations currently contain mostly natural views of the Fraser River South Arm and Deas Slough, respectively, with human development small to medium in scale. Once the Project is completed and operational, the views from these viewpoints will be dominated by the new bridge as it will be directly adjacent to these viewpoints.

With the new bridge, the viewscape from Viewpoint 15 (Deas Island Regional Park Lookout) will likely experience a change in VQC rating from Retention to Partial Retention. This viewpoint is located relatively far from the new bridge (approximately 1,300 m) but will experience changes in the views from the distant appearance of the bridge towers and cables against the relatively flat existing landscape. Discernable details of the bridge are more difficult to perceive as distance increases from the Project.

Due to its large scale and linear features, the VQC ratings in other locations close to the new bridge are likely to change from Modification to Maximum Modification once it is in place. The viewpoints where the VQC rating of the viewscape is likely to change from Modification to Maximum Modification are:

- Viewpoint 4 (Tunnel Access Road).
- Viewpoint 6 (Captain's Cove Marina).
- Viewpoint 14 (Millennium Trail beside Captain's Cove).

River House Restaurant and Marina (Viewpoints 1 and 2), currently have a modified viewscape. With the new bridge, the viewscape will remain modified—the bridge towers, deck, and piers will be visible; however the view of the bridge deck and piers will be partly screened by trees. River Woods (Viewpoints 3 and 3B) have views towards the new bridge partially or fully screened by mature trees. Because of this, the VQC ratings of the viewscapes from these viewpoints will likely not change with the addition of the new bridge, and any change in visual quality resulting from the presence of the new bridge will be negligible for most of the year (i.e., when the trees have leaves).

Viewscales from the following viewpoints have an existing VQC rating that is not anticipated to change with the presence of the new bridge:

- Viewpoint 1 (River House Restaurant and Marina)
- Viewpoint 2 (River House Restaurant and Marina)
- Viewpoint 3 (River Woods Neighborhood)
- Viewpoint 3B (River Woods Neighborhood)
- Viewpoint 5 (Wellington Point Park)
- Viewpoint 7 (Admiral Way, south of Captain's Cove Marina)
- Viewpoint 8 (Cove Links Golf Course)
- Viewpoint 11 (Benches on Dyke Road)
- Viewpoint 12 (No.3 Road and Dyke Road)
- Viewpoint 13 (Westham Island Road near the single-lane bridge)
- Viewpoint 16 (Waterstone Pier residential complex)
- Viewpoint 17 (Dyke and Williams Road)

Table 5.5-6 Summary of Characteristics and Effects on Visual Quality for the New Bridge

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|---|--|--|--|---|---|---------------------------------|
| Viewpoint 1: River House Restaurant and Marina | Modification |  | This location will have views of the bridge towers, deck, and piers from the marina and restaurant. | Modification |  | No |
| Viewpoint 2: River House Restaurant and Marina | Modification |  | This location will have views of the bridge towers, deck, and piers from the marina and restaurant. | Modification |  | No |
| Viewpoint 3: River Woods neighbourhood | Partial Retention |  | This location will have views of the bridge towers through trees on River Woods property. Views of the bridge will be partially screened when the trees have leaves. | Partial Retention |  | No |

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|---|--|--|--|---|---|---------------------------------|
| Viewpoint 3B: River Woods neighbourhood | Partial Retention |  | This location will have screened views of the bridge deck and cables through the trees. Views of the bridge will be partially screened when the trees have leaves. | Partial Retention |  | No |
| Viewpoint 4: Tunnel Access Road (south side) | Modification |  | This location is directly adjacent to the bridge and will have clear views of the bridge towers, deck, and piers. | Maximum Modification |  | Yes |
| Viewpoint 5: Wellington Point Park | Retention |  | This location will have distant views of the bridge towers, against a background with tall buildings in Burnaby and New Westminster and the coastal mountains. | Retention |  | No |

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|--|--|--|--|---|---|---------------------------------|
| Viewpoint 6: Captain's Cove Marina | Modification |  | This location will have clear views of the bridge towers and deck and screened views of the piers. | Maximum Modification |  | Yes |
| Viewpoint 7: Admiral Way, south of Captain's Cove Marina | Maximum Modification |  | This location will have clear views of the bridge towers. The view of the bridge deck and piers is partially screened by trees, and would be nearly fully screened when the trees have leaves. | Maximum Modification |  | No |
| Viewpoint 8: Cove Links Golf Course | Maximum Modification |  | This location will have clear views of the bridge towers. The view of the bridge deck and piers will be partially screened by trees, and remain that way until the trees have leaves and the residential development is completed. | Maximum Modification |  | No |

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|--|--|--|--|---|---|---------------------------------|
| Viewpoint 9: Millennium Trail between River Woods and Highway 99 | Partial Retention |  | This location will have direct views of the bridge deck and piers. | Maximum Modification |  | Yes |
| Viewpoint 10: East of Captain's Cove Marina | Partial Retention |  | This location will have direct views of the bridge towers, deck and piers. | Maximum Modification |  | Yes |
| Viewpoint 11: Benches on Dyke Road (west of No.5 Road) | Modification |  | This location will have a slightly screened view of the new bridge towers, deck and piers. | Modification |  | No |

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|---|--|--|---|---|---|---------------------------------|
| Viewpoint 12: No.3 Road and Dyke Road (dog park and public pier) | Modification |  | This location will not have any views of the bridge however screened views may be visible further east on the unpaved path. | Modification |  | No |
| Viewpoint 13: Westham Island Road near the single-lane bridge | Partial Retention |  | This location will have distant views of the bridge towers, against a background of distant buildings and mountains. | Partial Retention |  | No |
| Viewpoint 14: Millennium Trail beside Captain's Cove | Modification |  | This location will have direct views of the bridge deck and piers. | Maximum Modification |  | Yes |

| Viewpoint ID | Existing Visual Quality Class of Viewscape | Existing Conditions | Visibility of the New Bridge | Future Visual Quality Class of Viewscape with the Project | Simulated Potential Conditions | Change in Visual Quality Class? |
|--|--|--|--|---|---|---------------------------------|
| Viewpoint 15: Deas Island Regional Park Lookout | Retention |  | This location will have clear views of the bridge deck, tower, and piers. | Partial Retention |  | Yes |
| Viewpoint 16: Waterstone Pier residential complex | Modification |  | This location will have views of the bridge towers, deck, and piers. | Modification |  | No |
| Viewpoint 17: Dyke and Williams Road | Partial Retention |  | This location will have partial views of the bridge towers, deck, and piers. | Partial Retention |  | No |

Interchange Upgrades

The visual assessment of interchanges being improved as part of the Project, involves a qualitative evaluation of the degree to which overall visual quality would change as a result of the Project.

Westminster Highway Interchange

Access to Highway 99 south, for westbound traffic on Westminster Highway, will be improved with a new access ramp. The access ramp will be constructed on the northwest corner of the interchange on the opposite side of Westminster Highway from the nearest residential area. The changes are entirely contained within the current right-of-way and within an area of grass and trees maintained as road verge by the Ministry of Transportation and Infrastructure. The proposed works represent an expansion in the number of lanes but no substantive change in the general nature of the infrastructure including the elevation of the existing and proposed structure.

Considering that land use adjacent to the Westminster Interchange includes limited residential development, with views typically oriented away from Highway 99, and that the nature of the existing infrastructure will not change substantially, the overall impact is considered to be low because the magnitude of the change is small and the area is already developed.

Visual Quality Classification: For this interchange, once upgrades are completed, the VQC is considered to be identical to that of the current situation and ranges from Partial Retention around Richmond Nature Park to Modified in other areas adjacent to the interchange. As noted previously, the visual sensitivity class at this location is considered to be generally low. As a result of these considerations, there is no change in the visual quality classification.

Steveston Highway Interchange

To improve the access and egress of this interchange, and accommodate all movements while avoiding the requirement for additional agricultural land, a three-level interchange may be considered.

The planned improvements in this area will result in some changes to the viewscape for adjacent receptors, including some in the residential development in close proximity to the Project. Adjacent land use is dominated by vehicle-oriented commercial and retail developments which currently experience high volumes of vehicle traffic on Steveston Highway and Number 5 Road.

While visual quality will be affected by the higher elevation of the new infrastructure, reducing existing congestion represents an improvement to visual quality in adjacent areas. The landscape adjacent to the Steveston Interchange will continue to be dominated by transportation, agricultural, commercial and residential development, as it does now. Some visual conditions will improve with reductions in congestion, others will overall remain similar.

Visual Quality Classification: Considering the proposed changes, the VQC for this interchange remains unchanged and ranges from Modification in agricultural areas (i.e., where the natural landscape is marginally present and human development is very easy to see and large in scale) to Maximum Modification elsewhere (i.e., where human development continues to dominate the landscape). Also, as noted, the visual sensitivity class at this location is considered to be generally low. As a result of these considerations, there is no change in the visual quality classification.

Highway 17A Interchange

Modifications to the existing over/underpass will involve development of a full movement interchange with some increase in height to accommodate all traffic movements while avoiding the requirement for additional agricultural land. The reference concept for the Highway 17A interchange contemplates roundabouts placed on the east and west side of Highway 99. The roundabout on the east side of Highway 99 would allow for the removal of the traffic lights on Highway 17A east of the interchange.

While the improved interchange will be higher than the current structure, the proposed works will result in improvements to visual conditions. The visual impact on the commercial property on the northwest corner of the interchange will improve with the removal of the traffic lights and reductions in congestion on Highway 99. Further, there are no residential developments in close proximity that include receptors that would experience a change in visual conditions.

Visual Quality Classification: Considering the proposed changes, the VQC for this upgraded interchange remains unchanged and is considered Modification (i.e., where the natural landscape is marginally present and human development is very easy to see and large in scale). Also, as noted the VSC at this location is considered to be generally low. As a result of these considerations, there is no change in the visual quality classification.

5.5.5 Mitigation Measures

A hierarchical approach based on avoidance of potential effects followed by minimization or reduction of unavoidable effects was used in identifying strategies to mitigate potential Project-related effects on visual quality at sensitive locations.

5.5.5.1 Avoidance

Because the Project involves replacement of the Tunnel with a bridge, and upgrades to existing interchanges to accommodate future forecasted traffic, changes in visual quality are unavoidable; however, design considerations have been incorporated into the Project to ensure that the structure is aesthetically pleasing and blends well with the local and regional landscape.

5.5.5.2 Minimization

The presence of the new bridge will add noticeable visual features to the landscape and result in changes in visual conditions of the viewsapes from certain viewpoints. Wherever possible, at those viewpoints where the greatest effects to visual quality will occur, addition of vegetation buffers could screen views and partially reduce the visual effects of having a large bridge structure in the foreground. The most directly affected locations include points along the Millennium Trail, on either side of the new bridge, and along the foreshore by Captain's Cove Marina, between the residential development and the new bridge. In designing vegetation buffers at these locations, the desire to screen views of the bridge will need to be balanced with the desire to maintain views of Deas Slough or the Fraser River and nearby mature vegetation.

The Ministry will develop and share potential options for minimizing Project-related effects with stakeholders prior to finalizing the appropriate type and extent of vegetated buffers to be installed within 150 m on either side of the bridge alignment.

Establishment of vegetation at appropriate locations to screen objects that interfere with visual quality is a best management practice that has been applied effectively in similar projects, and is expected to be effective in addressing potential effects of the Project on viewsapes from sensitive receptor locations.

As substantial structures currently exist at Steveston Highway, Westminster Highway and Highway 17A, and the assessment conducted did not identify any changes in the visual quality classifications at these locations, no mitigation is proposed to address changes in visual conditions associated with the upgraded structure. As such, changes in visual conditions, associated with highway improvements noted, are not carried forward into assessment of residual effects.

5.5.6 Residual Effects and their Significance

Residual effects are those adverse effects that remain after implementation of mitigation measures. Measures proposed to avoid or minimize Project-related effects on visual quality (primarily implementation of vegetative screening) were identified based on standard best practices and proven methodologies. Accordingly, there is a high level of confidence in the effectiveness of these measures and their ability to minimize Project-related effects on visual quality.

After the implementation of mitigation measures, there are residual effects with respect to changes in conditions predicted for the following viewpoints:

- Viewpoint 4 (Tunnel Access Road). Modification changes to Maximum Modification.
- Viewpoint 6 (Captain's Cove Marina). Modification changes to Maximum Modification.
- Viewpoint 14 (Millennium Trail beside Captain's Cove). Modification changes to Maximum Modification.

These viewpoints are located in the immediate vicinity of the new bridge (i.e., within 1 km) and will have clear views of the structure as the absorptive capacity of the landscape is lower than at distances greater than 1 km. At distances of greater than 1 km absorptive capacity is higher as the new bridge will appear smaller, and other man-made and natural structures will become prominent in the landscape (high-rise towers, industrial complexes and mountains). These other structures act to draw the eye away from, or compete with, views of the new structure. No residual effects to visual quality are predicted for viewpoints more distant to the new bridge (i.e., viewpoints 9, 10 and 15).

The new bridge will add noticeable visual features and affect viewscapes from viewpoints closest to the new bridge alignment. Overall, within the LAA, the visual effect of the new bridge is expected to result in changes in visual conditions that are moderate in magnitude, site-specific in extent, long-term in duration and, continuous, and only reversible if the bridge is removed.

The area surrounding the Project is already impacted at a moderate to high level by human development. As a result, the Project alignment has a low sensitivity, or high resilience, to additional human alterations. Given the noticeable change in the level of alteration when a tunnel is replaced with a bridge, the likelihood of the new bridge resulting in changes to visual quality is high.

Effects to viewsapes from all viewpoints are assessed together. The potential residual effect was characterized by qualitatively assessing the direction, magnitude, geographic extent, duration, frequency, and reversibility of the effect. Definitions for the ratings applied to the residual effect are presented in **Table 5.5-7**.

Context: The new bridge structure, a large angular feature, will increase the extent of human alteration in viewscape within the LAA, especially for viewers close to the bridge. The associated change in visual quality, however, is subjective and dependant on the perception and opinion of the viewer. A rating for direction (i.e., adverse, positive, or neutral) that is based on level of change has not been provided as it would not represent the preference of all viewers. Rating for the magnitude of Project-related effects was developed in the context of sensitivity of the viewscape to alteration, as measured by VSC (**Table 5.5-2**), with specific reference to visual quality experienced from sensitive receptor sites.

Table 5.5-7 Criteria Used to Characterize Residual Effects on Visual Quality

| Criteria | Description | Definition of Rating | |
|-----------|--|----------------------|---|
| Magnitude | Amount of the effect relative to natural or baseline conditions | Negligible | Effect not detectable at LAA scale. |
| | | Low | Effects detectable but will not alter visual quality ratings. |
| | | Moderate | Effects could result in a minor or moderate change in visual quality (i.e., negative change in VQC of more than one classification) for viewpoints within 1 km. |
| | | High | Effects could have a major influence on visual quality (i.e., negative change in VQC of more than two classifications) for viewpoints within 1 km. |
| Extent | Geographic extent / distribution of the residual effect | Site-Specific | Limited to directly individual sites. |
| | | Local | Effect detectable over entire LAA. |
| | | Regional | Effect detectable in area larger than the LAA. |
| Duration | Length of time over which the residual effect is expected to persist | Transient term | Limited to field investigations or <1 month during construction. |
| | | Short term | Limited to Project construction phase. |
| | | Moderate term | Will affect VC during first five years of operation, then be mitigated. |
| | | Long term | Effect is permanent. |

| Criteria | Description | Definition of Rating | |
|---------------|---|----------------------|---|
| Frequency | Nature of the occurrence of the residual effect (e.g., how often the stressor impacts the VC) | Once | Residual effect will occur once. |
| | | Rare | 1-2 times per year and intermittently. |
| | | Uncommon | 3-5 times per year and intermittently. |
| | | Frequent | More than 5 times per year or for extended periods. |
| | | Continuous | Continuous or ongoing. |
| Reversibility | Potential for the effect to be reversed or naturally return to baseline level after the disturbance has ceased (or following a period of time after the disturbance has ceased) | Reversible | Existing conditions will be restored after effect has ceased. |
| | | Irreversible | Existing conditions will not be restored after effect ceases. |
| | | Change | Effect may fluctuate between positive and adverse for the duration. |

A summary of the criteria ratings used to characterize the residual effect on visual conditions is provided in **Table 5.5-8**.

Table 5.5-8 Summary of Criteria Ratings for Change in Visual Conditions

| Criteria | Criteria Rating | Rationale for Criteria Rating |
|---------------|-----------------|--|
| Magnitude | Moderate | It will result in a noticeable change, compared to the Tunnel; however, it will be consistent with the level of alteration associated with a major highway in a populated urban area that is undergoing active growth. |
| Extent | Site-specific | The adverse effects are most evident within one kilometre of the bridge alignment because the area's flat topography and tall mature vegetation diminish the visibility of the bridge as seen from a distance. |
| Duration | Long-term | The effects will be experienced for as long as the bridge is in place. |
| Frequency | Continuous | The effect is continuous, especially for potentially sensitive viewers, like residents and recreationists, who spend more time in proximity to the Project alignment. |
| Reversibility | Irreversible | The existing visual conditions cannot be completely restored if the bridge is removed. |

5.5.6.1 Significance Definition

The residual effect of the new bridge and interchange upgrades on visual conditions will be considered significant if the magnitude of the effect is high (i.e., visual change is prominent in relation to existing natural and anthropogenic features) and the effect extends beyond the site (i.e., greater than one kilometre from the Project alignment).

The long-term plans for Richmond and Delta indicate continued growth in population and employment. The changes in visual conditions associated with ongoing growth in these communities are typically experienced as low to moderate in magnitude, with the trend being the incremental loss of natural areas and increasing extent of alteration in the landscape. The construction and operation of the bridge, which supports provincial and regional goals, will have an effect on visual resources, but not one that is greater than that typically experienced in growing municipalities with major transportation routes. The residual effect of visual impacts would be considered significant if:

- viewscales from 2/3rd of the viewpoints assessed have a negative change in VQC (i.e., negative visual quality classification change).

- viewscales from 1/3rd of the viewpoints assessed, which had high original VQC (i.e., Retention or Partial Retention), had a negative change in VQC of greater than two classifications.

This definition acknowledges that for a significant effect to occur, there must be negative changes to a multitude of viewpoints (i.e., 2/3rd of the total viewpoints changing by 1 VQC class), and some of those changes need to be substantial in magnitude and affect high-value or high sensitivity viewpoints (i.e., 1/3rd of the total with high original VQC changing by at least 2 classes).

5.5.6.2 Significance Determination

The significance determination of the Project-related residual effect on visual conditions, the likelihood of the residual effect, and the level of confidence associated with determinations of significance and likelihood are presented in **Table 5.5-9**. Likelihood characterization was based on professional judgement and the definition above. The effects were also defined as those having low, moderate, or high probability of resulting in an adverse residual effect on visual resources. Low, moderate, or high confidence reflects the level of uncertainty associated with determinations of significance and likelihood.

Table 5.5-9 Summary of Significance Determination for Residual Effects on Visual Resources

| Residual Effect | Significance (significant/not significant) | Likelihood (low/moderate/high) | Level of Confidence (low/moderate/high) |
|-----------------------------|--|--------------------------------|---|
| Change in visual conditions | Not significant | High | High |

Residual effects from the Project on changes in visual conditions are not expected to be significant on the basis that:

- Only six of the 17 viewpoints (35%) assessed had changes in VQC of the viewscape.
- Only two of 8 viewpoints (25%) with high VQC ratings had negative changes in VQC of the viewscape of greater than two classifications.

In reaching this conclusion, it is noted that the magnitude of the residual effect is moderate at the small number of viewpoints from where the new bridge structure will be noticeable, compared to the existing Tunnel. However, the extent of the residual effect is site-specific (i.e., within one kilometre of the new bridge), and most viewpoints have no change in VQC of the viewscape as a result of the Project. There was no change in VQC (no visual impact) assessed for the modified interchanges.

The likelihood of residual Project effects on visual quality is high, as the likelihood of the causal disturbance (i.e. construction and operation of the bridge) is high.

The level of confidence in this significance determination is high, based on the results of the simulated future visual conditions and the Ministry's experience with previous major infrastructure projects in the region.

The findings in this assessment are subjective as viewer perceptions and opinions on having a new bridge or upgraded interchange as part of the viewscape, and the aesthetics of the new bridge itself would vary widely.

5.5.7 Cumulative Effects and their Significance

The effects of the Project combined with the effects of other projects and activities that have been carried out are considered in existing conditions. The combination of the residual Project effects on visual quality with the effects of other certain and reasonably foreseeable projects and activities comprise the future cumulative effects on visual quality.

Spatial Boundaries

The spatial boundary of the cumulative effects assessment for visual quality is defined as the area within a six kilometre radius centered on the highest point of the new bridge deck. Beyond six kilometres, the views of the bridge and interchanges will be mostly screened by intermediate structures and vegetation, and thus are not anticipated to interact cumulatively with other projects and activities.

Other Certain and Reasonably Foreseeable Projects and Activities

A review of other current and reasonably foreseeable projects and activities (**Section 3.10.1 Identifying Past, Present or Reasonably Foreseeable Projects and/or Activities**) identified one project with new structures or components that might be visible from the locations where Project-related changes in visual quality are expected. Based on a review of EAO Project Information Centre (e-PIC), the Canadian Environmental Assessment Registry, and project websites, no other projects with anticipated visual effects that could combine with those of the Project were identified within the assessment boundary.

The replacement of B.C. Hydro and Power Authority's (B.C. Hydro) Massey Circuit transmission line, which currently passes under the Fraser River through the Tunnel, will be reconfigured to a crossing of the Fraser River outside of the Tunnel and parallel with the Project. Currently, three crossing options have been considered including:

- Alternative 1: An overhead transmission line crossing the Fraser River. Based on information currently available from B.C. Hydro (2015), this alternative would include two steel lattice towers, approximately 120 metres in height (approximately half the height of the proposed new bridge towers), would support the overhead 230-kilovolt line crossing the Fraser River. One transmission tower would be located on Deas Island and the other in Richmond, to the west of the new bridge. B.C. Hydro would place these towers in line with the proposed new bridge towers, and the conductor lines would hang at approximately the same height as the bridge deck to mitigate visual and potential avian impacts. A second, smaller steel lattice tower, approximately 75 metres in height, would also be required on Deas Island.
- Alternative 2: An underground transmission line running under the Fraser River. Based on information available from B.C. Hydro (2015), this alternative would consist of a transmission line running under the Fraser River, parallel to the new bridge, from Richmond to Deas Island. A borehole path would be created using horizontal directional drilling. Once a borehole path is drilled, conduits would be installed, through which the transmission cables would be pulled. The cables would terminate on either side of the river, at a transition infrastructure called a pothead, where they would transition from underground cables to an overhead line. A steel lattice tower, approximately 75 metres in height, would also be required on Deas Island.
- Alternative 3: A transmission line located on the new bridge. Based on information available from B.C. Hydro (2015), this alternative would include installation of the transmission line on the new bridge. This alternative requires a steel lattice tower, approximately 75 metres in height, on Deas Island and a pothead on either side of the Fraser River. The transmission cables would run from the ground in vertical shafts up the bridge, on either end of the bridge, and through a box girder within the main bridge deck.

While a decision on which alternative will be selected has not been made, B.C. Hydro has indicated that Alternative 1 appears to be the technically-leading alternative for a number of reasons, including providing a high level of safety and reliability of service.

Cumulative Interactions and Potential Cumulative Effects

For the purposes of this assessment it is assumed that the reconfigured transmission line will be the overhead transmission line crossing (Alternative 1). This assumption is considered the most conservative as it would have the greatest potential impact on visual conditions relative to other options that are being explored by B.C. Hydro. Further assumptions regarding the future reconfiguration of the transmission lines are based on B.C. Hydro's (2015) description of this alternative, and include:

- Towers for the new transmission line will be in the existing B.C. Hydro ROW and therefore close to the new bridge and existing poles where the transmission line exits the Tunnel portals.
- Towers will be in alignment with bridge piers and the transmission line will be in alignment with the bridge deck.

On this basis, the new transmission line is not considered to result in a residual effect on visual conditions. In addition, the proximity of the new bridge to the transmission line and the co-alignment of the components will result in the two blending into the viewscape, rather than appearing as separate structures. As such, the Project is not expected to interact with residual effects from B.C. Hydro's new transmission line or other projects, and no cumulative effect to visual quality is expected.

5.5.8 Follow-up Strategy

The mitigation proposed to address effects on visual quality focuses on the establishment of vegetation adjacent to the bridge abutments that are within the viewscape of nearby residential developments. Evaluation of the integrity of the vegetated buffer over one to two growing seasons, and if required, maintenance or restoration, is proposed. As the establishment of vegetated buffers is a best management practice that has been applied effectively in similar projects, no other follow-up measures are proposed.

6.1 Heritage Resources Assessment Highlights:

- The Project is located in an area where substantial historical development has occurred, and the majority of the Project alignment is characterized as having low archaeological potential.
- No archaeological or historical sites were found within the Project alignment during the field inventory of the Project area.
- The development and implementation of an Archaeological and Heritage Resources Management Plan, which will include a chance-find procedure, will avoid impacts to previously unknown heritage resources that may be encountered during Project construction and operation.
- No Project-related residual or cumulative effects on heritage resources are expected.

6.1 Heritage Resources

This section presents the results of the assessment of potential effects of the Project on heritage resources, and includes a description of existing conditions, potential Project-related effects and proposed mitigation measures, and an evaluation of residual Project-related and cumulative effects.

6.1.1 Context and Boundaries

This section describes the context for assessment of Project-related effects on heritage resources in terms of Project setting, and defines the spatial and temporal assessment boundaries. Rationale for selecting the assessment boundaries as defined is also provided.

No jurisdictional, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects, or accessibility constraints or gaps in data that could limit the ability to predict the effects of the Project were identified; therefore administrative or technical boundaries are not considered.

6.1.1.1 Assessment Context

Heritage resources, in the context of this assessment, comprise archaeological and historical heritage sites, objects, and features. In this assessment, archaeological sites are defined as those sites that pre-date AD 1846, or sites that are undated and could pre-date AD 1846. Historical heritage sites are those that originated since AD 1846.

In accordance with the B.C. *Heritage Conservation Act (HCA)*, R.S.B.C 1996, c. 187, heritage resources include, but are not limited to:

- Artifacts, features, materials, or other physical evidence of human habitation or use prior to AD 1846.

- Burial places and human remains with archaeological or historical value.
- First Nations rock paintings or First Nations rock carvings that have archaeological or historical value.
- Heritage wrecks (i.e., vessels or aircraft) or heritage objects from a heritage wreck.

The assessment of heritage resources follows the general methodology described in **Section 3.0 Assessment Methodology** and applied to all VCs. Indicators used to assess the potential Project-related effects on heritage resources are based on the provincial guidelines for archaeological overview assessments (AOAs) and archaeological impact assessments (AIAs) (B.C. FLNR 1998, 2009). These indicators and the rationale for their selection are presented in **Table 6.1-1**.

Table 6.1-1 Indicators for Heritage Resources

| Indicator | Rationale for Selection |
|--|---|
| Disturbance of archaeological sites, objects, and features | <ul style="list-style-type: none"> • Disturbance may affect site integrity. |
| Disturbance of historical sites, objects, and features that are subject to protection under the <i>HCA</i> | |
| Changes in level of accessibility to archaeological sites, objects, and features | <ul style="list-style-type: none"> • Reduced accessibility may inhibit opportunities for research, preservation, or public appreciation. • Increased accessibility may expose heritage resources to vandalism or looting. |
| Changes in level of accessibility to historical sites, objects, and features that are subject to protection under the <i>HCA</i> | |

6.1.1.2 Assessment Boundaries

The assessment boundaries for heritage resources are defined below.

Spatial Boundaries

The local assessment area (LAA) and regional assessment area (RAA) for heritage resources are defined in **Table 6.1-2**, and shown on **Figure 6.1-1**. The boundaries of the LAA take into account the scale and spatial extent of potential environmental effects that are appropriate for heritage resources. The RAA is intended to provide regional context for the assessment.

Table 6.1-2 Spatial Boundary Definitions for Heritage Resources

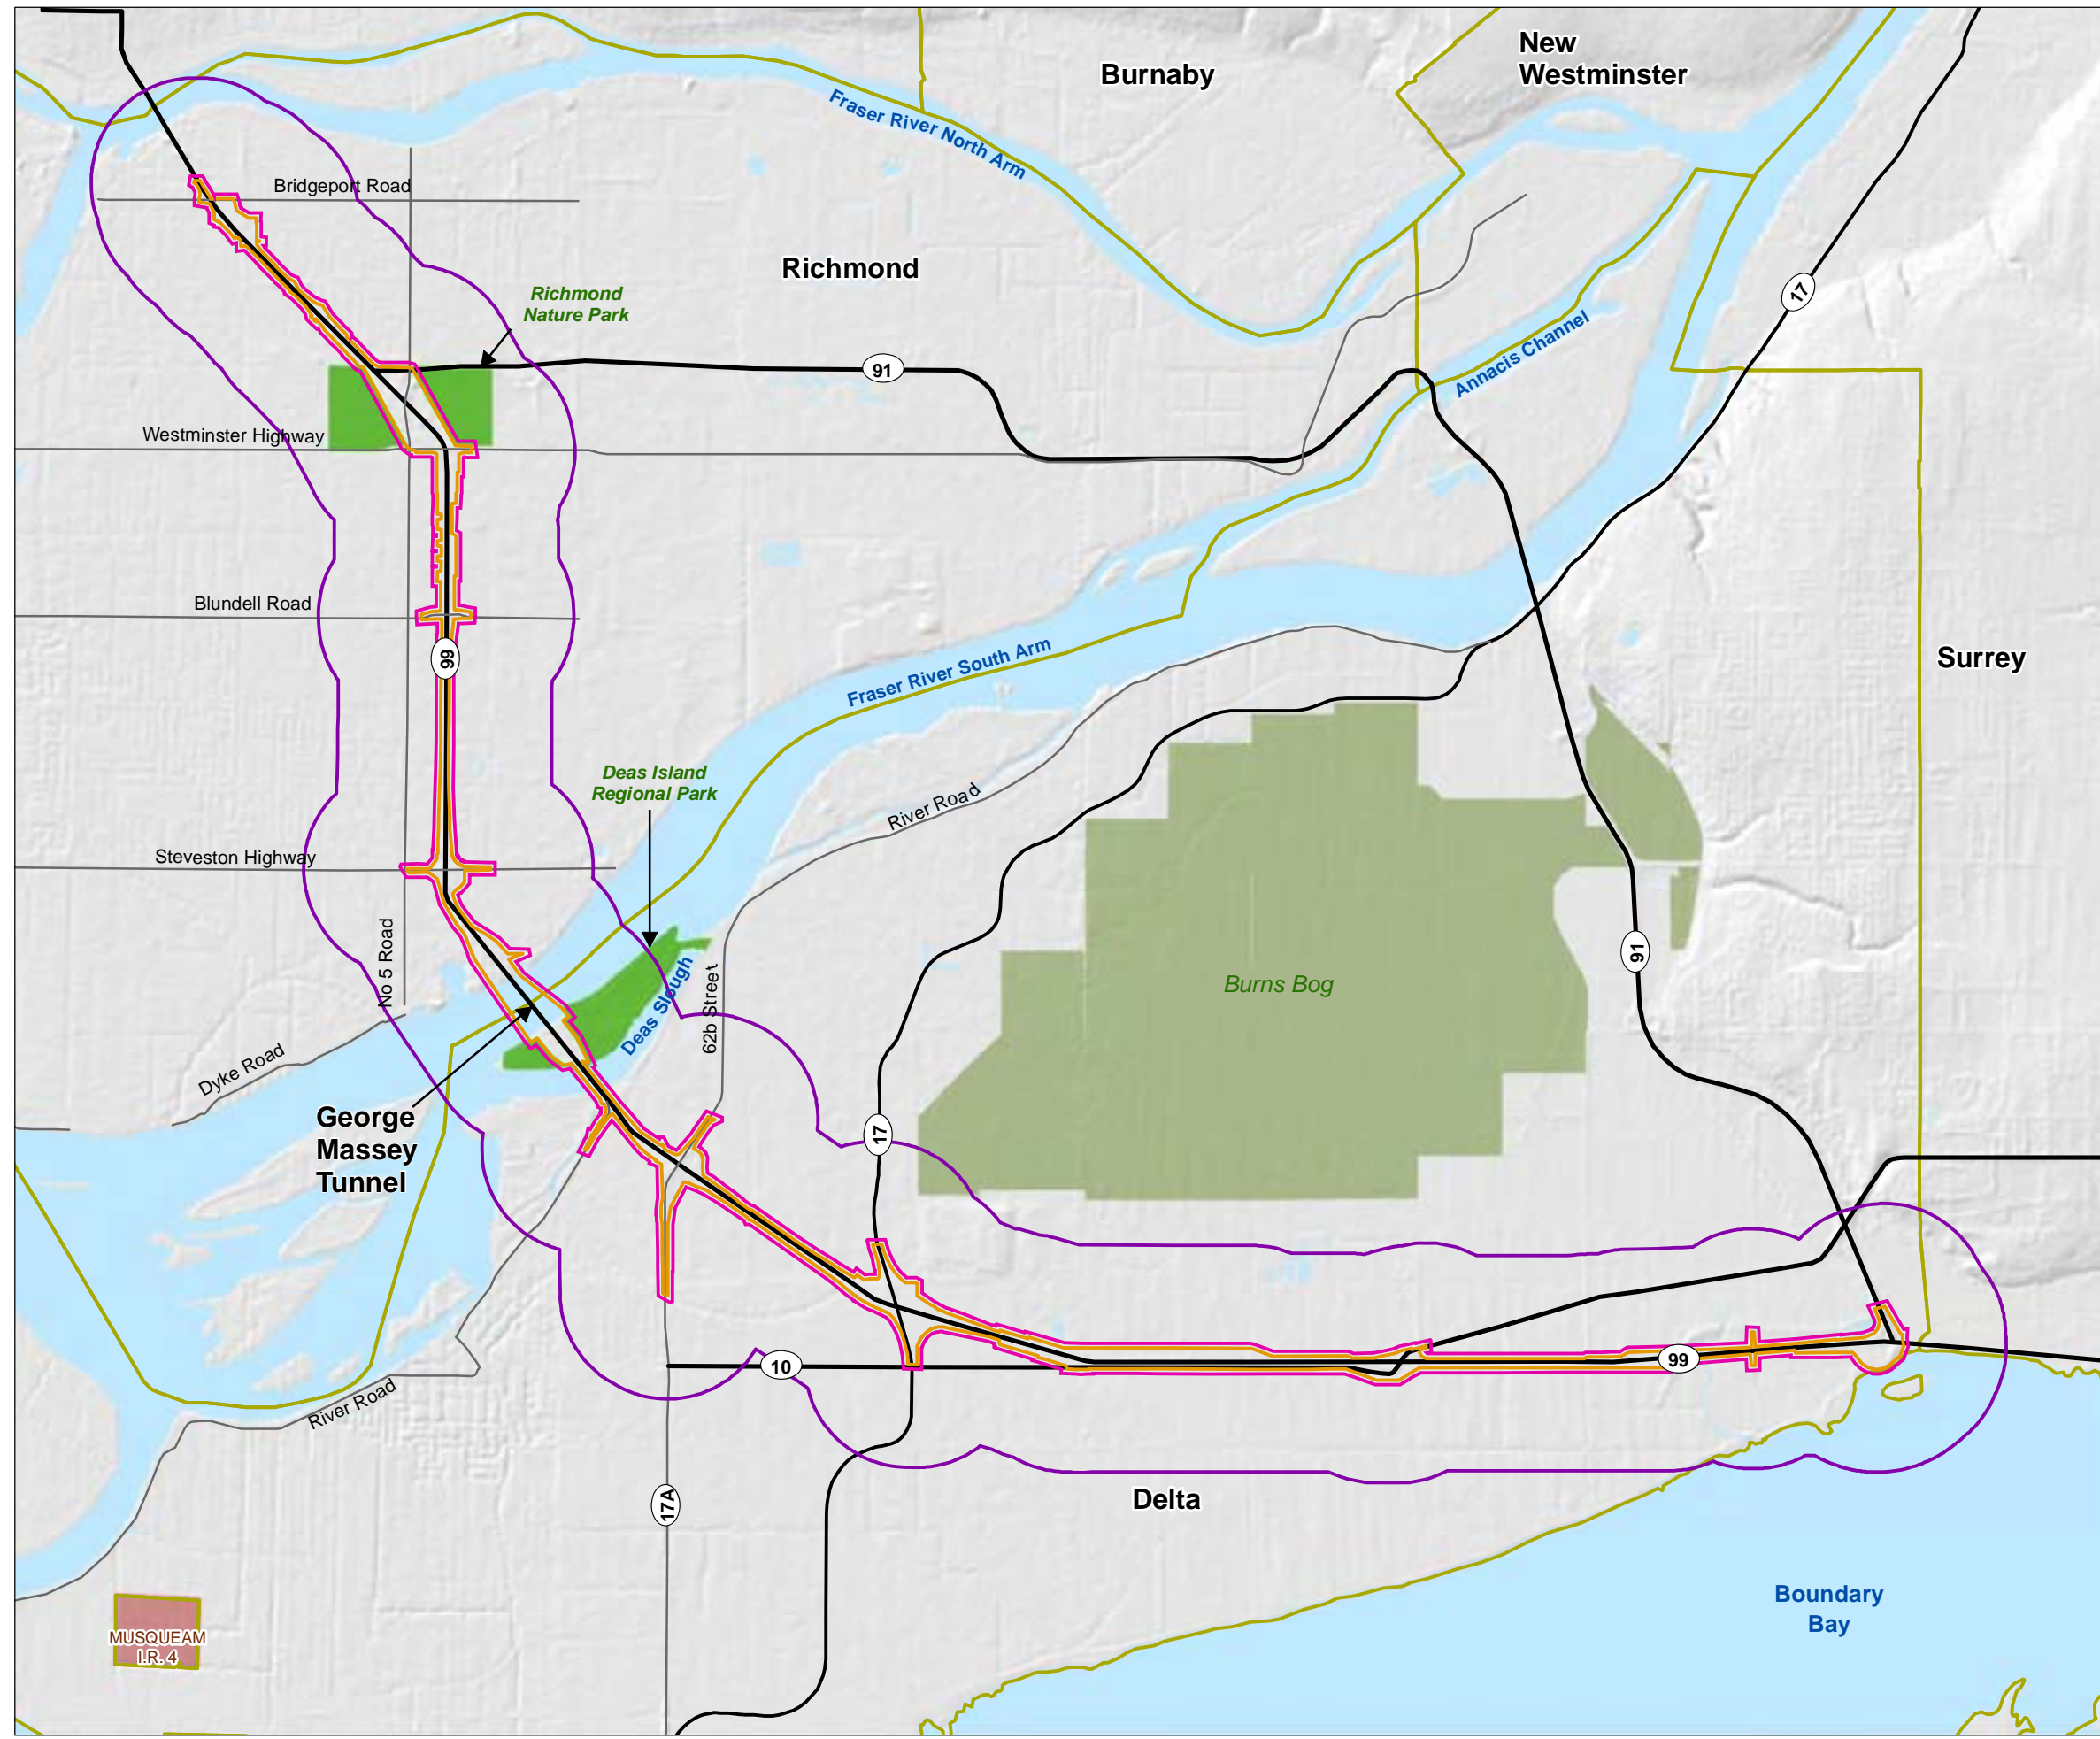

| Spatial Boundary | Description of Assessment Area |
|---------------------------------------|---|
| Local Assessment Area (LAA) | Project alignment |
| Regional Assessment Area (RAA) | Project alignment, plus one kilometre surrounding the Project alignment |

The LAA was selected to encompass the area within which the Project is expected to interact with, and potentially have an effect on heritage resources. Given the site-specific and stationary nature of heritage resources, the Project alignment is the maximum area within which potential direct and indirect Project effects on heritage resources are reasonably expected to occur.

An area encompassing the Project alignment and a one kilometre buffer around it was selected as the RAA. An AOA of the RAA was undertaken to identify known heritage resources and archaeological potential of the Project alignment, and determine the need for and scope of further studies to assess Project-related effects on heritage resources.

Informed by the results of the AOA, an AIA was undertaken within the LAA. In accordance with the *British Columbia Archaeological Impact Assessment Guidelines* (B.C. FLNR 1998), the effects assessment was undertaken only within the LAA, since heritage sites located outside of the LAA are not relevant to the assessment of Project effects.

Temporal Boundaries

Temporal boundaries for the assessment of Project-related effects on heritage resources were established based on the potential for each phase of the Project to interact with and have an effect on this VC. As discussed in **Section 3.1 Issues Scoping and Selection of Valued Components**, both the construction and operational phases of the Project include components and activities that could interact with and affect heritage resources present within the Project alignment; therefore, the following temporal boundaries were defined for the heritage resources assessment:

- Existing conditions.
- Construction phase (including decommissioning of the Tunnel).
- Operations phase (including maintenance).

Temporal characteristics of the Project phases are discussed in **Section 1.1 Description of Proposed Project**.

Administrative Boundaries

No administrative boundaries, i.e. political, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects on heritage resources, have been identified.

Technical Boundaries

A few areas, or portions of areas, of archaeological potential within the assessment area were inaccessible due to environmental, infrastructure, or access constraints. In this context, the need for and scope of additional archaeological assessment to confirm the absence of heritage resources within the Project alignment will be reviewed once the detailed Project design is complete.

6.1.2 Existing Conditions

This section provides an overview of the methodology for collecting baseline data, and describes the existing conditions of heritage resources within the assessment areas. An overview of the regulatory context for management of heritage resources as relevant to the Project is also provided.

6.1.2.1 Baseline Data Collection

In 2014, the Ministry initiated desktop and field studies on heritage resources to support Project planning and assessment. Building on available information, these studies, as summarized in **Table 6.1-3**, were designed to address known data gaps.

Table 6.1-3 Desktop and Field Studies Related to Heritage Resources

| Study Name | Purpose of Study |
|---------------------------------------|---|
| Desktop literature review | <ul style="list-style-type: none"> • Determine archaeological and heritage resources potential for the local assessment area (LAA). • Identify key data gaps and areas of uncertainty within the LAA. |
| Field inventory of heritage resources | <ul style="list-style-type: none"> • Identify and evaluate heritage resources within the LAA. |

Desktop Literature Review

Information pertaining to heritage resources was gathered through an established process with regulators and interested Aboriginal Groups. The B.C. Archaeology Branch forwarded an *HCA* permit application relevant to the Project to several Aboriginal communities and organizations. Details of this process and a list of participants are provided in **Appendix A**

A review of available information pertaining to local and regional prehistory, history, built heritage, and other heritage resources was conducted for the LAA. Detailed topographic and orthographic maps were reviewed to identify areas of past and present land development, and locations that may have higher archaeological potential than surrounding terrain (e.g. streams or elevated landforms).

Readily available reports on the environment, land use by Aboriginal Groups, and archaeology of the LAA were also reviewed. Environmental data reviewed included deltaic development, watercourses, surficial geology, past sea levels, biological environments, ecological communities, and flora and faunal resources. In addition, results of selected geotechnical investigations conducted in the LAA were reviewed to evaluate the natural deposits and depth of fill. Historical aerial photographs were examined to understand historical land use and to identify areas of past disturbance. Available historical maps were consulted to identify historical shorelines, locations of minor drainages, and Aboriginal sites. Provincial and local government heritage registers were searched to identify recorded archaeological or heritage sites in the LAA. Proprietary cultural heritage resource, heritage wreck, and radiocarbon sample databases were also consulted.

Information on the location and nature of previously recorded heritage sites was obtained through a search of the Provincial Heritage Register and a review of existing archaeological, ethnographic, and historical literature relevant to the LAA.

Data reviewed from readily available public sources, including ethnographies, Aboriginal place names and land use of culturally valued landscapes, plants, and animals, as well as locations of settlements and subsistence strategies, were collected and plotted (Matthews 1955, Musqueam Indian Band 1976, Rozen 1979, McHalsie 2001, Hul'qumi'num Treaty Group 2005). To assist in making determinations pertaining to archaeological potential and traditional use within and adjacent to the LAA, information was obtained from the Stó:lō Research and Resource Management Centre (SRRMC) Traditional Use Study database (SRRMC 2014).

Where site-specific information was available, it was used to aid in the interpretation of field results and the development of mitigation measures. Information received from Aboriginal Groups was subsequently added to the summary of Aboriginal place names and land use data.

Using information derived from the literature review, the LAA was analyzed to identify areas of relative archaeological potential and select field inventory locations. Three levels of archaeological potential, as defined below, were used to classify sites within the LAA based on the predicted integrity of archaeological deposits:

- **Archaeological Potential:** These are areas that correlate with the setting of known archaeological sites in adjacent areas and that have had limited disturbance from previous land use. Such areas have the highest potential to contain intact or disturbed archaeological deposits at any depth. Examples of these locations include riparian setbacks, forested areas and bogs.
- **Compromised Archaeological Potential:** These are areas that correlate with known archaeological sites in adjacent areas, and exhibit impacts to the uppermost sediment layers due to land development. There is potential for deeper, intact archaeological deposits to be present at these locations.
- **Removed Archaeological Potential:** These are areas that correlate with known archaeological sites in adjacent areas, but have previously undergone substantial land alterations that have eliminated the likelihood of archaeological deposits at any depth.

Areas in the LAA that did not fall within one of these three classes were characterized as having low archaeological potential due to environmental constraints on human use or on site preservation. **Figure 6.1-2** and **Appendix B** show the relative archaeological potential of areas within the LAA.

Historical heritage sites were identified using provincial and local government heritage registers, and assessed according to local guidelines for built heritage. Heritage wrecks in proximity to the LAA were identified and recorded in detail consistent with the *British Columbia Shipwreck Recording Guide* (B.C. FLNR 1991).

Consultation and Input from Aboriginal Groups

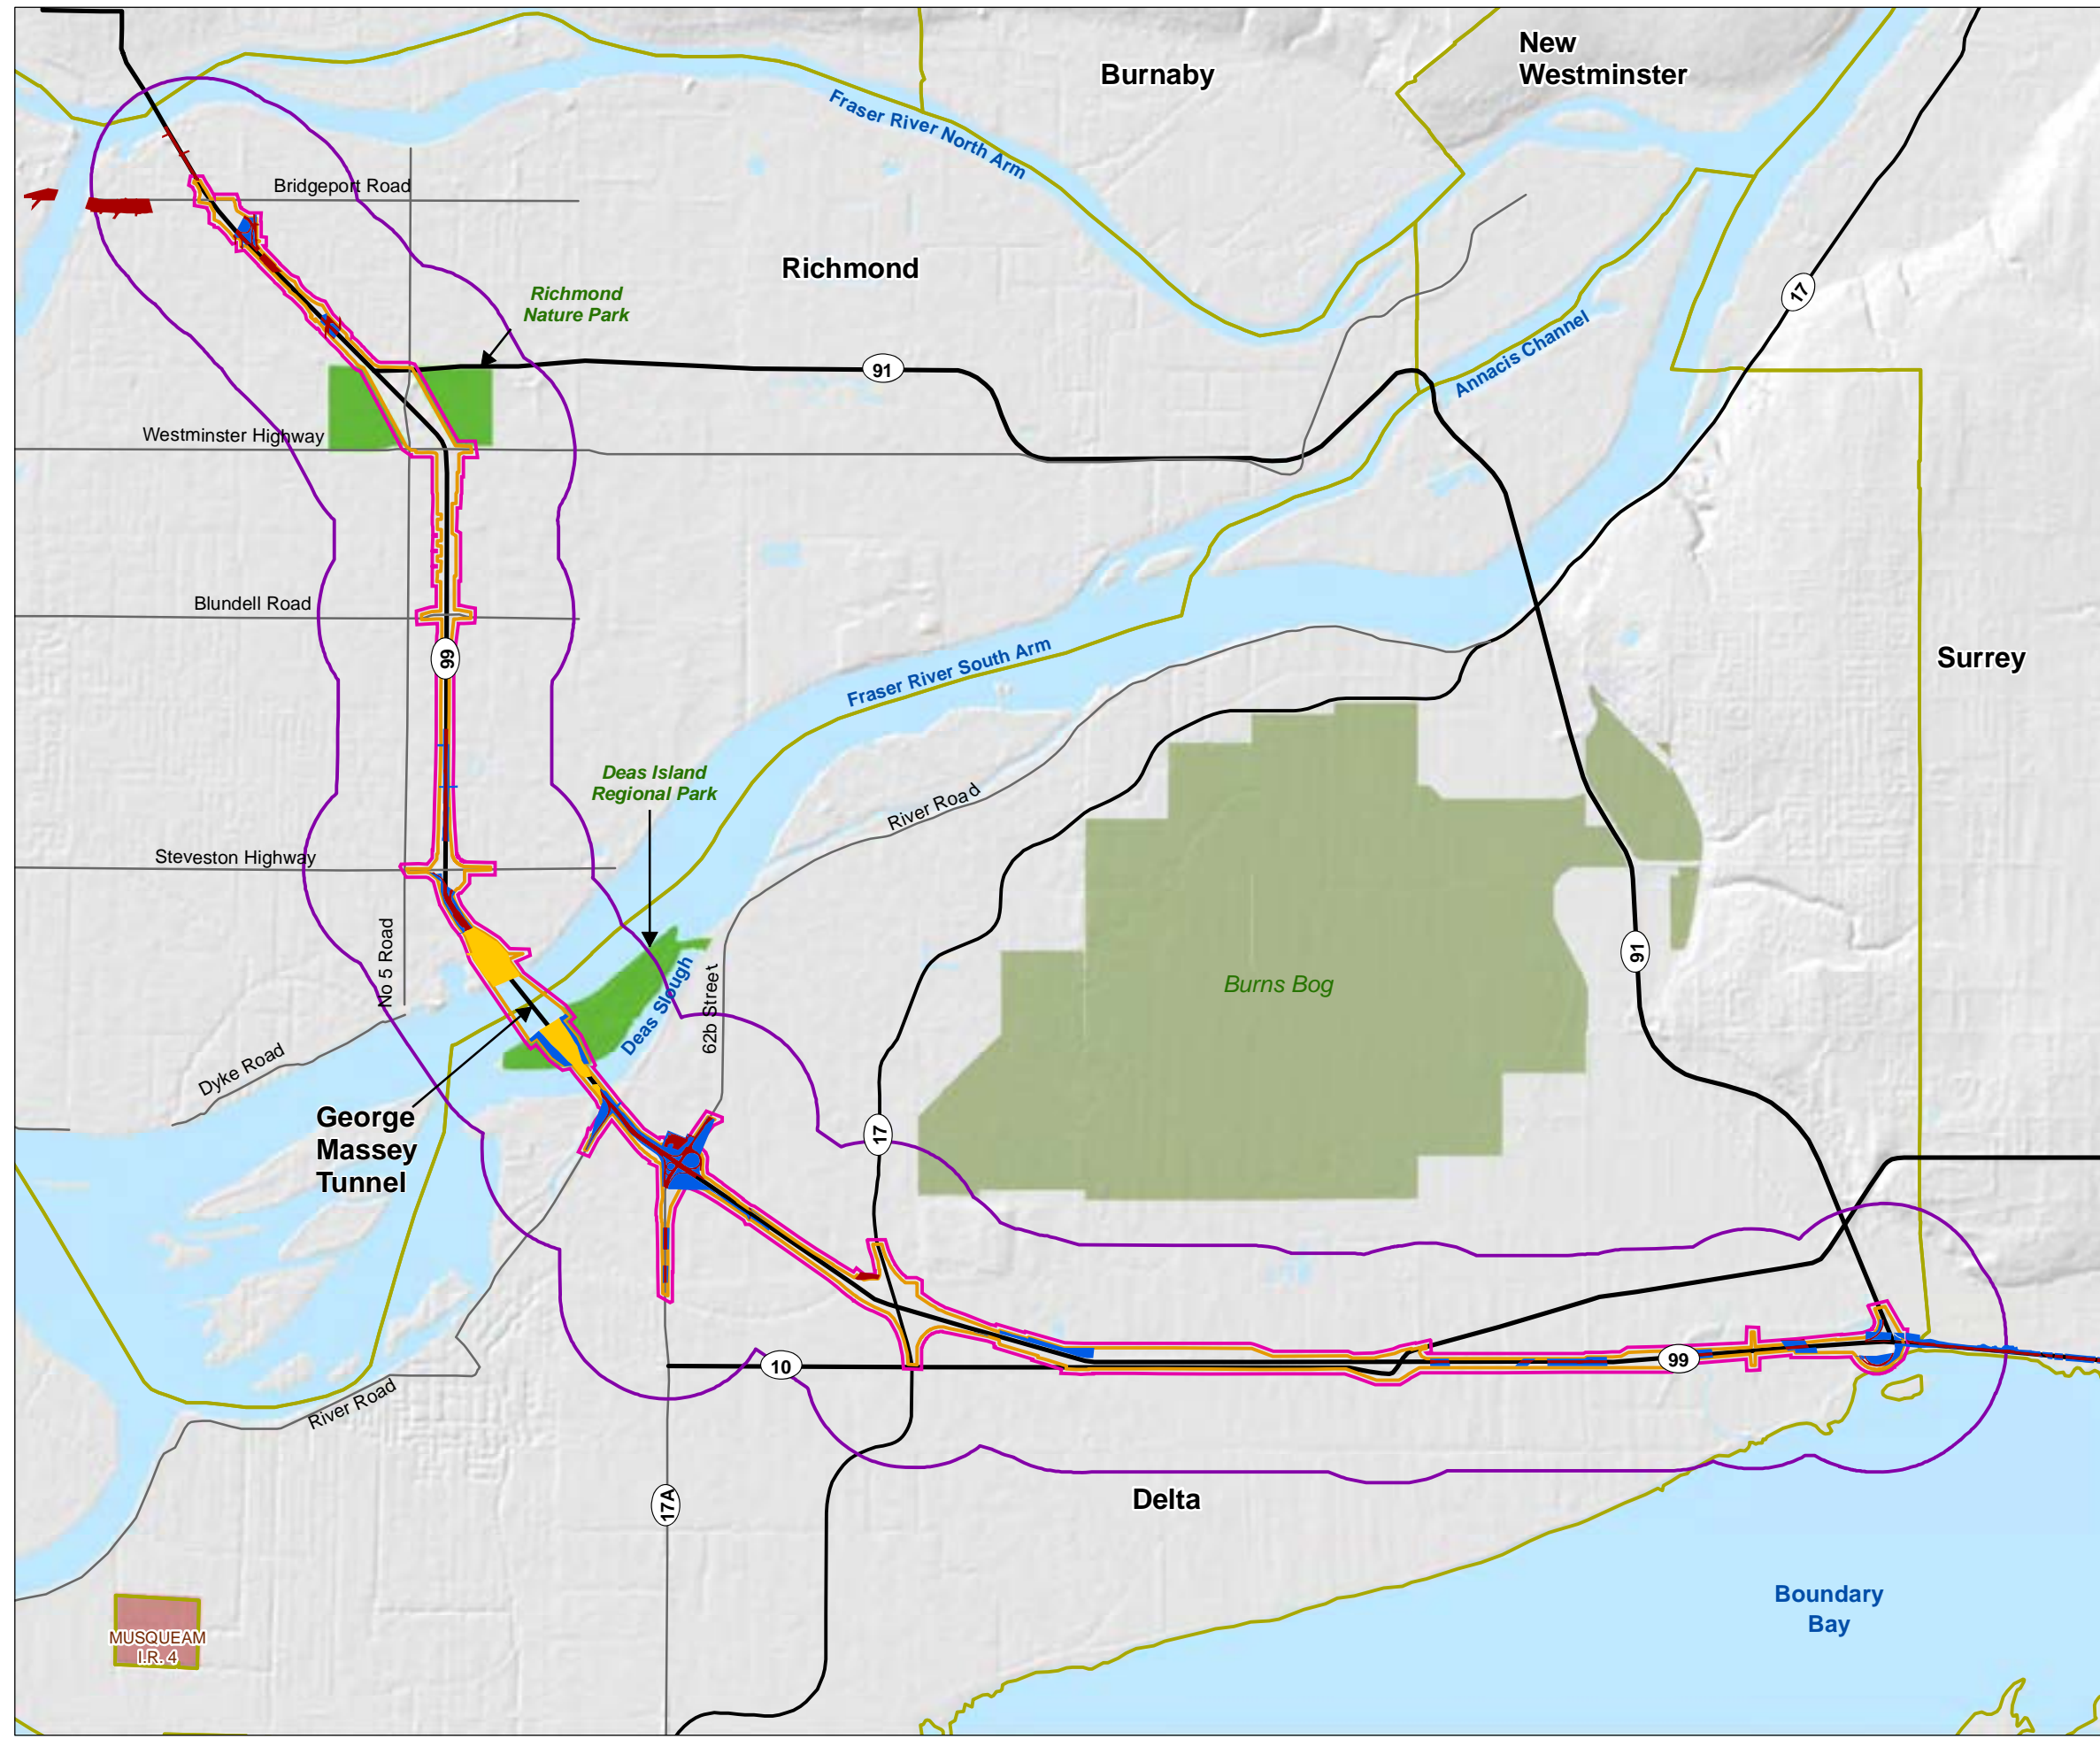

Potential impact of Project-related activities on heritage resources was identified as an area of specific interest by Aboriginal Groups during pre-Application consultation on the Project, and Aboriginal Groups have been engaged in the heritage resources assessment from early stages.

Traditional use studies in the context of the Project were undertaken by several Aboriginal Groups, and findings of the studies as well as relevant traditional knowledge shared with the Ministry during consultation informed the identification of potential archaeological or heritage sites, and supported the Project-related Heritage Resources Overview Assessment (HROA) and Heritage Resources Impact Assessment (HRIA). Draft reports on these assessments were shared with Aboriginal Groups for review and comment, and the Ministry and the Project archaeologist met with Aboriginal Groups to present the findings.

During pre-Application consultation Aboriginal Groups identified the potential for the presence of previously-unknown and unrecorded heritage sites in construction areas covered by infrastructure installed as part of the original development of the Highway 99 corridor as an area of potential interest. Potential for the presence of previously unknown heritage sites was taken into consideration in identifying potential Project-related effects on heritage resources (**Section 6.1.3 Potential Effects**) and measures to mitigate them (**Section 6.1.4 Mitigation Measures**).

Further detail on consultation activities undertaken with Aboriginal Groups is provided in **Section 10 Aboriginal Consultation**. Information provided by Aboriginal Groups on archaeological and heritage sites in and around the Project area is included in **Section 6.1.2.3 Existing Conditions**.

Field Inventory of Heritage Resources

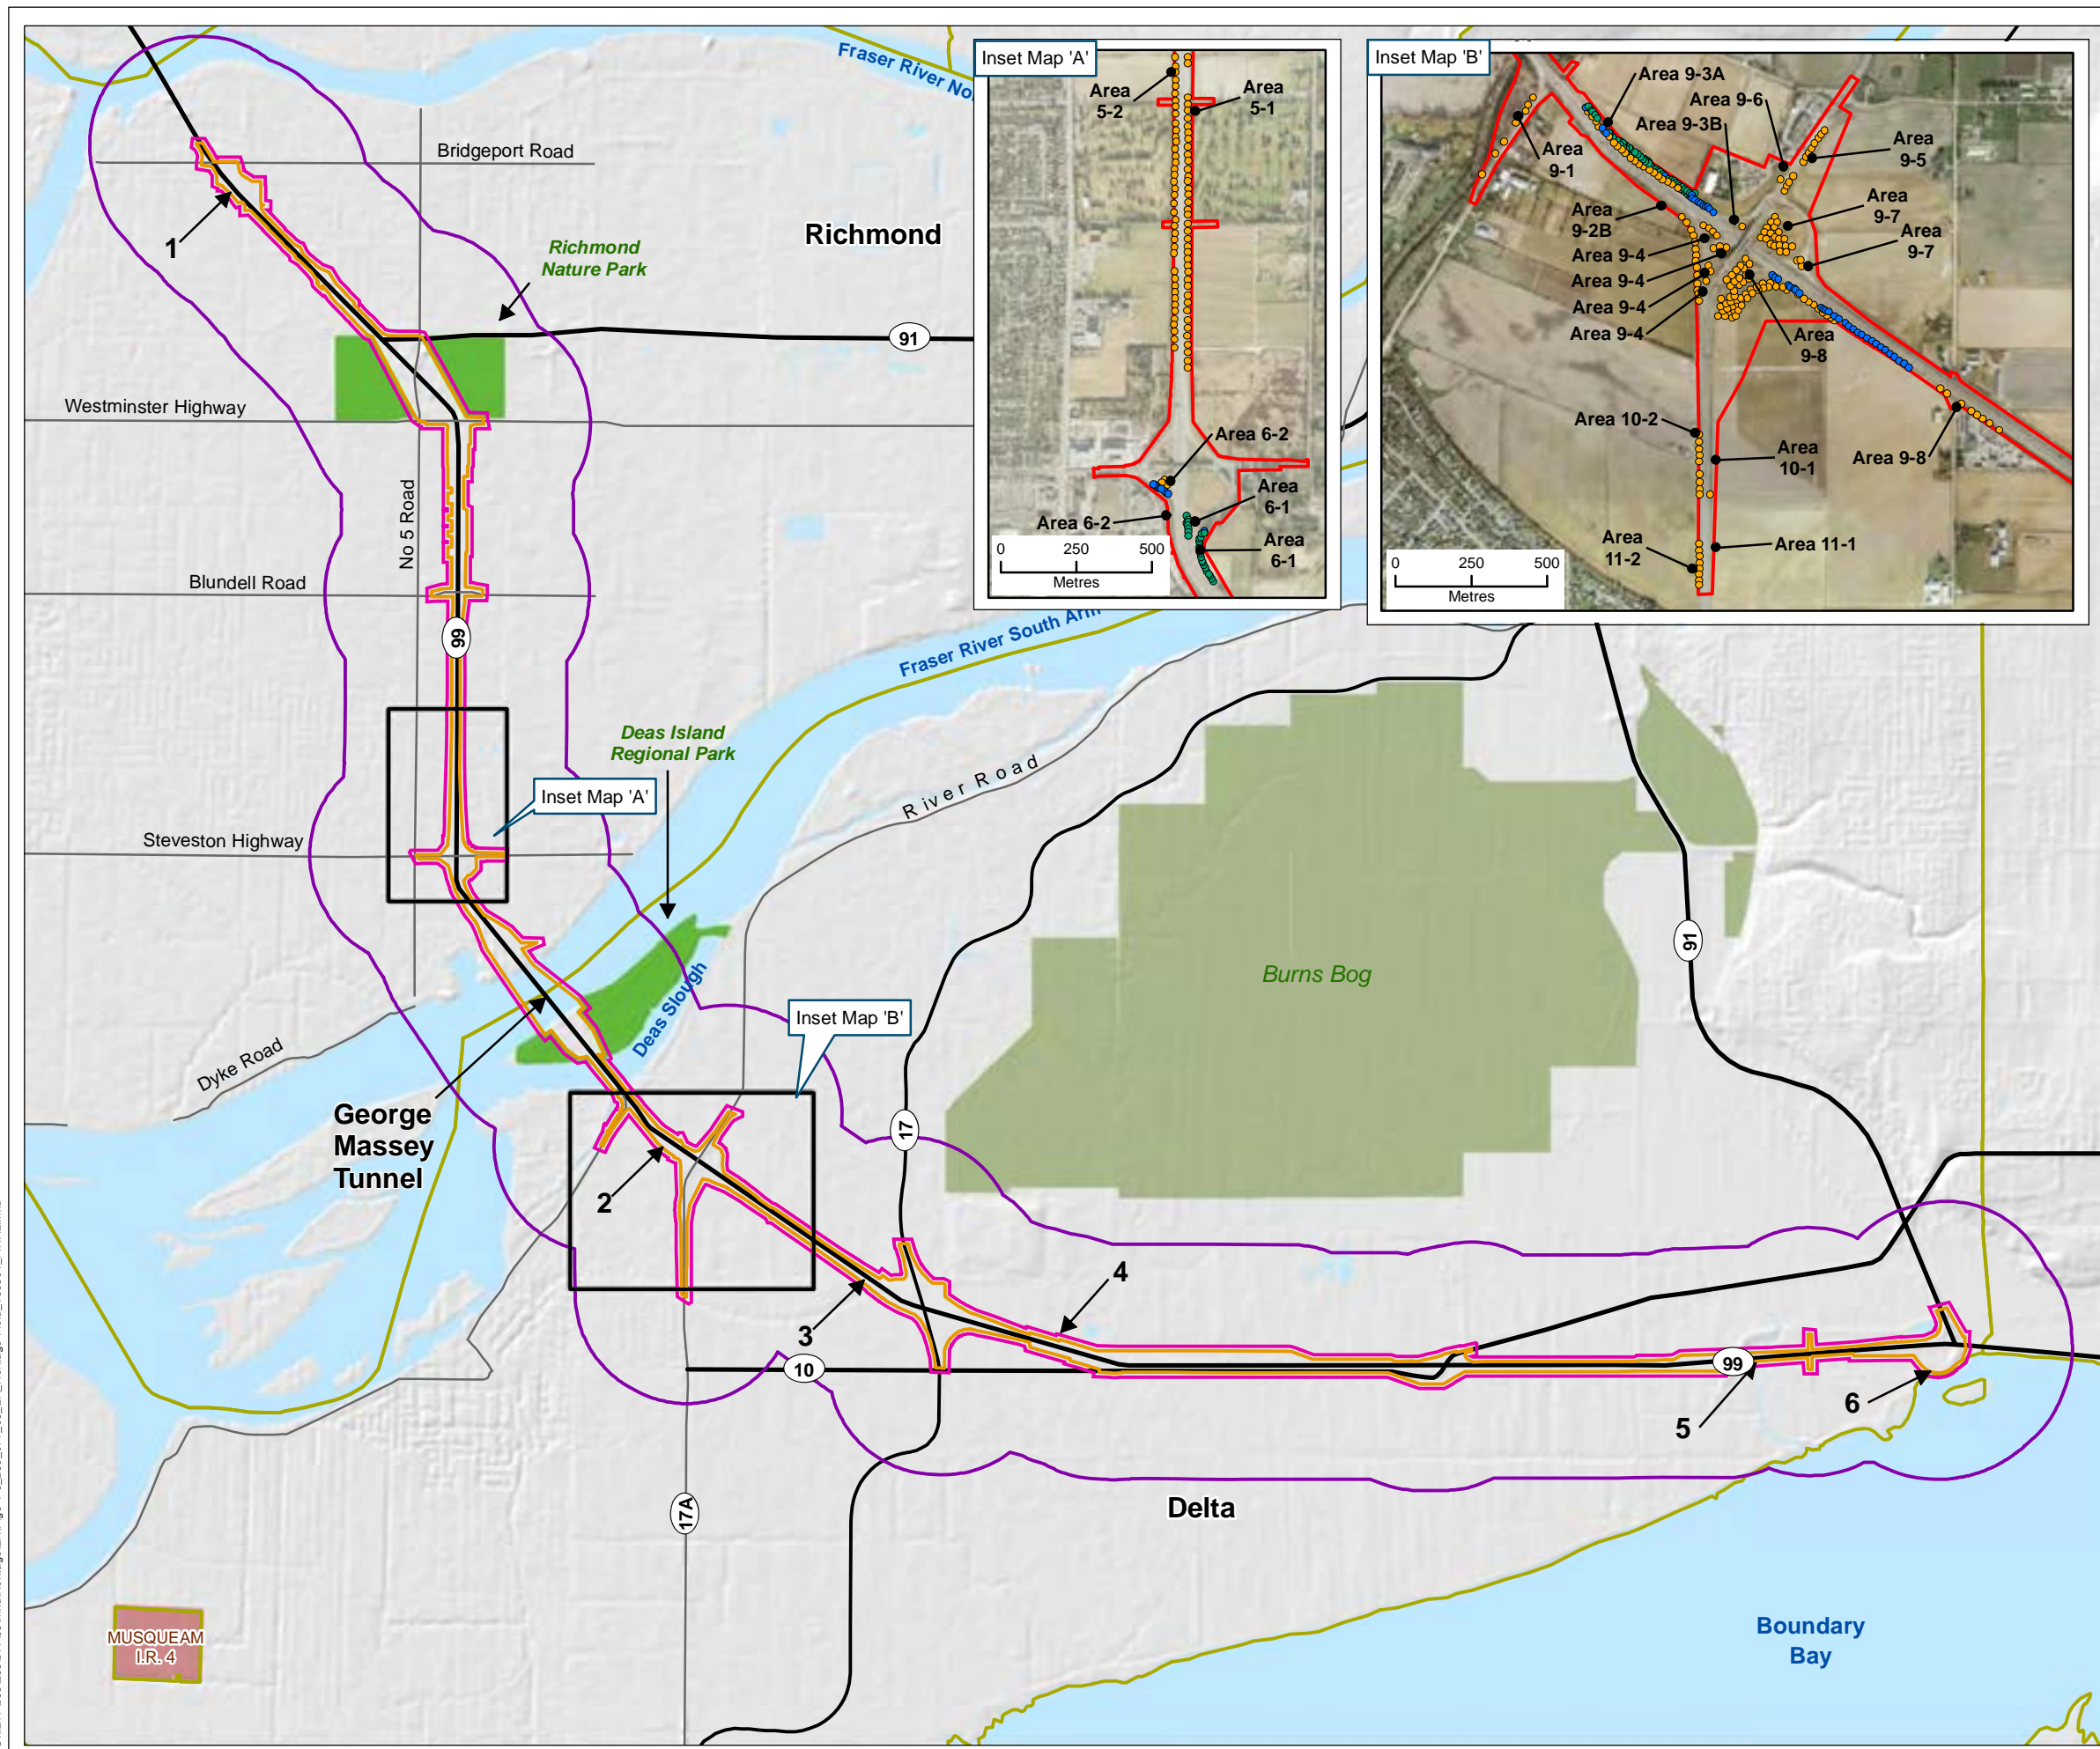

A field inventory was conducted in the LAA in September, October, and November 2014. The field inventory focused on areas identified through literature review as having the highest archaeological potential within the LAA (i.e., areas classified as having “archaeological potential” or “compromised archaeological potential” as discussed in **Section 6.1.2.2**

Regulatory Context and shown on **Figure 6.1-2**). Objectives of the field inventory were to:

- Identify, record, and assess heritage sites located within the LAA.
- Identify and evaluate possible effects of Project activities on these heritage sites.
- Recommend appropriate management actions.

The field inventory was undertaken in accordance with the *B.C. Archaeological Impact Assessment Guidelines* (B.C. FLNR 1998) and HCA permit 2014-0201. In addition, applicable permits from Aboriginal Groups were sought and obtained. Methods consisted of surface inspection and subsurface investigations for sites identified as having archaeological potential, using manual tools such as shovels and mechanical testing using power auger, backhoe, or excavator. As discussed in Appendix A, notification of the heritage resources field assessment was provided to all Schedule B Aboriginal Groups and Schedule B Aboriginal Groups were invited to participate in heritage resources field investigations.

A total of 413 subsurface tests were conducted in 16 areas in the LAA. Of these tests, 55 were excavated by hand, 90 were excavated using a power auger, and 268 were excavated using a backhoe or excavator. **Figure 6.1-3** shows the subsurface test locations.

Path: C:\1217-299-285\077\03\mxd\Heritage\EA\Fig-1-3_285_077_03_EA_Heritage-Field_160504_FINAL.mxd

6.1.2.2 Regulatory Context

The following statutes and guidance documents informed the assessment of Project-related effects on heritage resources:

- B.C. *Environmental Assessment Act* (B.C. *EAA*), S.B.C. 2002, c. 43
- B.C. *Heritage Conservation Act*
- Aboriginal Groups' heritage policies and memoranda of understanding

British Columbia Environmental Assessment Act

Under the B.C. *EAA*, the Environmental Assessment Office has issued guidance with respect to the assessment of potential effects on heritage resources. That guidance states that an assessment should be conducted in accordance with B.C. Archaeology Branch (Ministry of Forests, Lands, and Natural Resource Operations) standards.

British Columbia Heritage Conservation Act

In B.C., heritage sites on non-federal lands are administered by the B.C. Archaeology Branch and the B.C. Heritage Branch in accordance with the *HCA*. The B.C. Archaeology Branch is the agency responsible for administering the *HCA* and for maintaining the Provincial Heritage Register. The B.C. Heritage Branch exercises regulatory authority under the *HCA* with respect to the protection and alteration of designated (i.e., protected) heritage sites.

Section 13 of the *HCA* specifies that an individual (or corporation) must not “damage, excavate, dig in or alter, or remove any heritage object” from a heritage site, except in accordance with a permit issued by the Minister pursuant to Sections 12 and 14. The *HCA* confers automatic protection upon heritage sites that pre-date AD 1846, or undated sites that could pre-date AD 1846, regardless of whether they are recorded in the Provincial Heritage Register, whether they are located on Crown land or private property, or whether they are in a disturbed or intact context.

Section 9 (2)(c) of the *HCA* allows protection of historical sites under the B.C. *Local Government Act*, R.S.B.C., c. 323, or the *Vancouver Charter*, S.B.C 1953, c. 55. Historical sites (post AD 1846) can be protected by Ministerial Order, Designation by an Order-in-Council, or a municipal bylaw.

The requirements and procedures for heritage resource studies undertaken for development projects are described in the *British Columbia Archaeological Impact Assessment Guidelines* (B.C. FLNR 1998). Procedures for respectful handling of found human remains that are protected under the *HCA* are provided in the Found Human Remains Directive (B.C. FLNR 1999).

Heritage Policies of Aboriginal Groups and Memoranda of Understanding

Many B.C. Aboriginal Groups have developed their own heritage policies and permitting systems. In general, the scope of these policies reflects a desire to have some oversight of archaeological research in each Aboriginal Group's territory so that specific cultural protocols are observed, particularly as they relate to human remains and spiritual locations (Mason 2013). Aboriginal Groups and organizations known to have heritage policies and permitting systems that are relevant to the Project area include the Kwantlen First Nation (Seyem' Quantlen Business Group), Musqueam Indian Band, Stó:lō (Stó:lō Research and Resource Management Centre), Squamish Nation and Tsleil-Waututh Nation.

6.1.2.3 Existing Conditions

This section describes the existing conditions of heritage resources in the RAA, and a description of archaeological potential.

Archaeological and Ethnographic Background

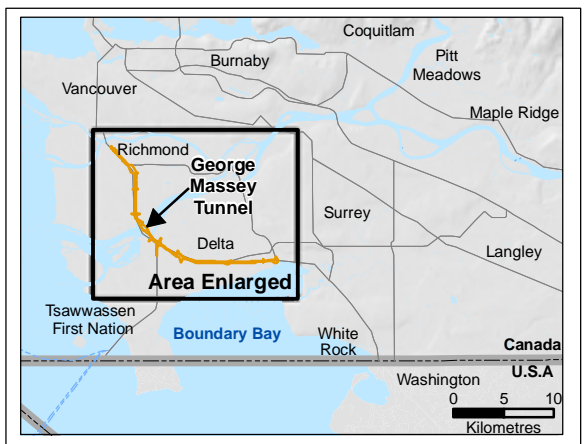

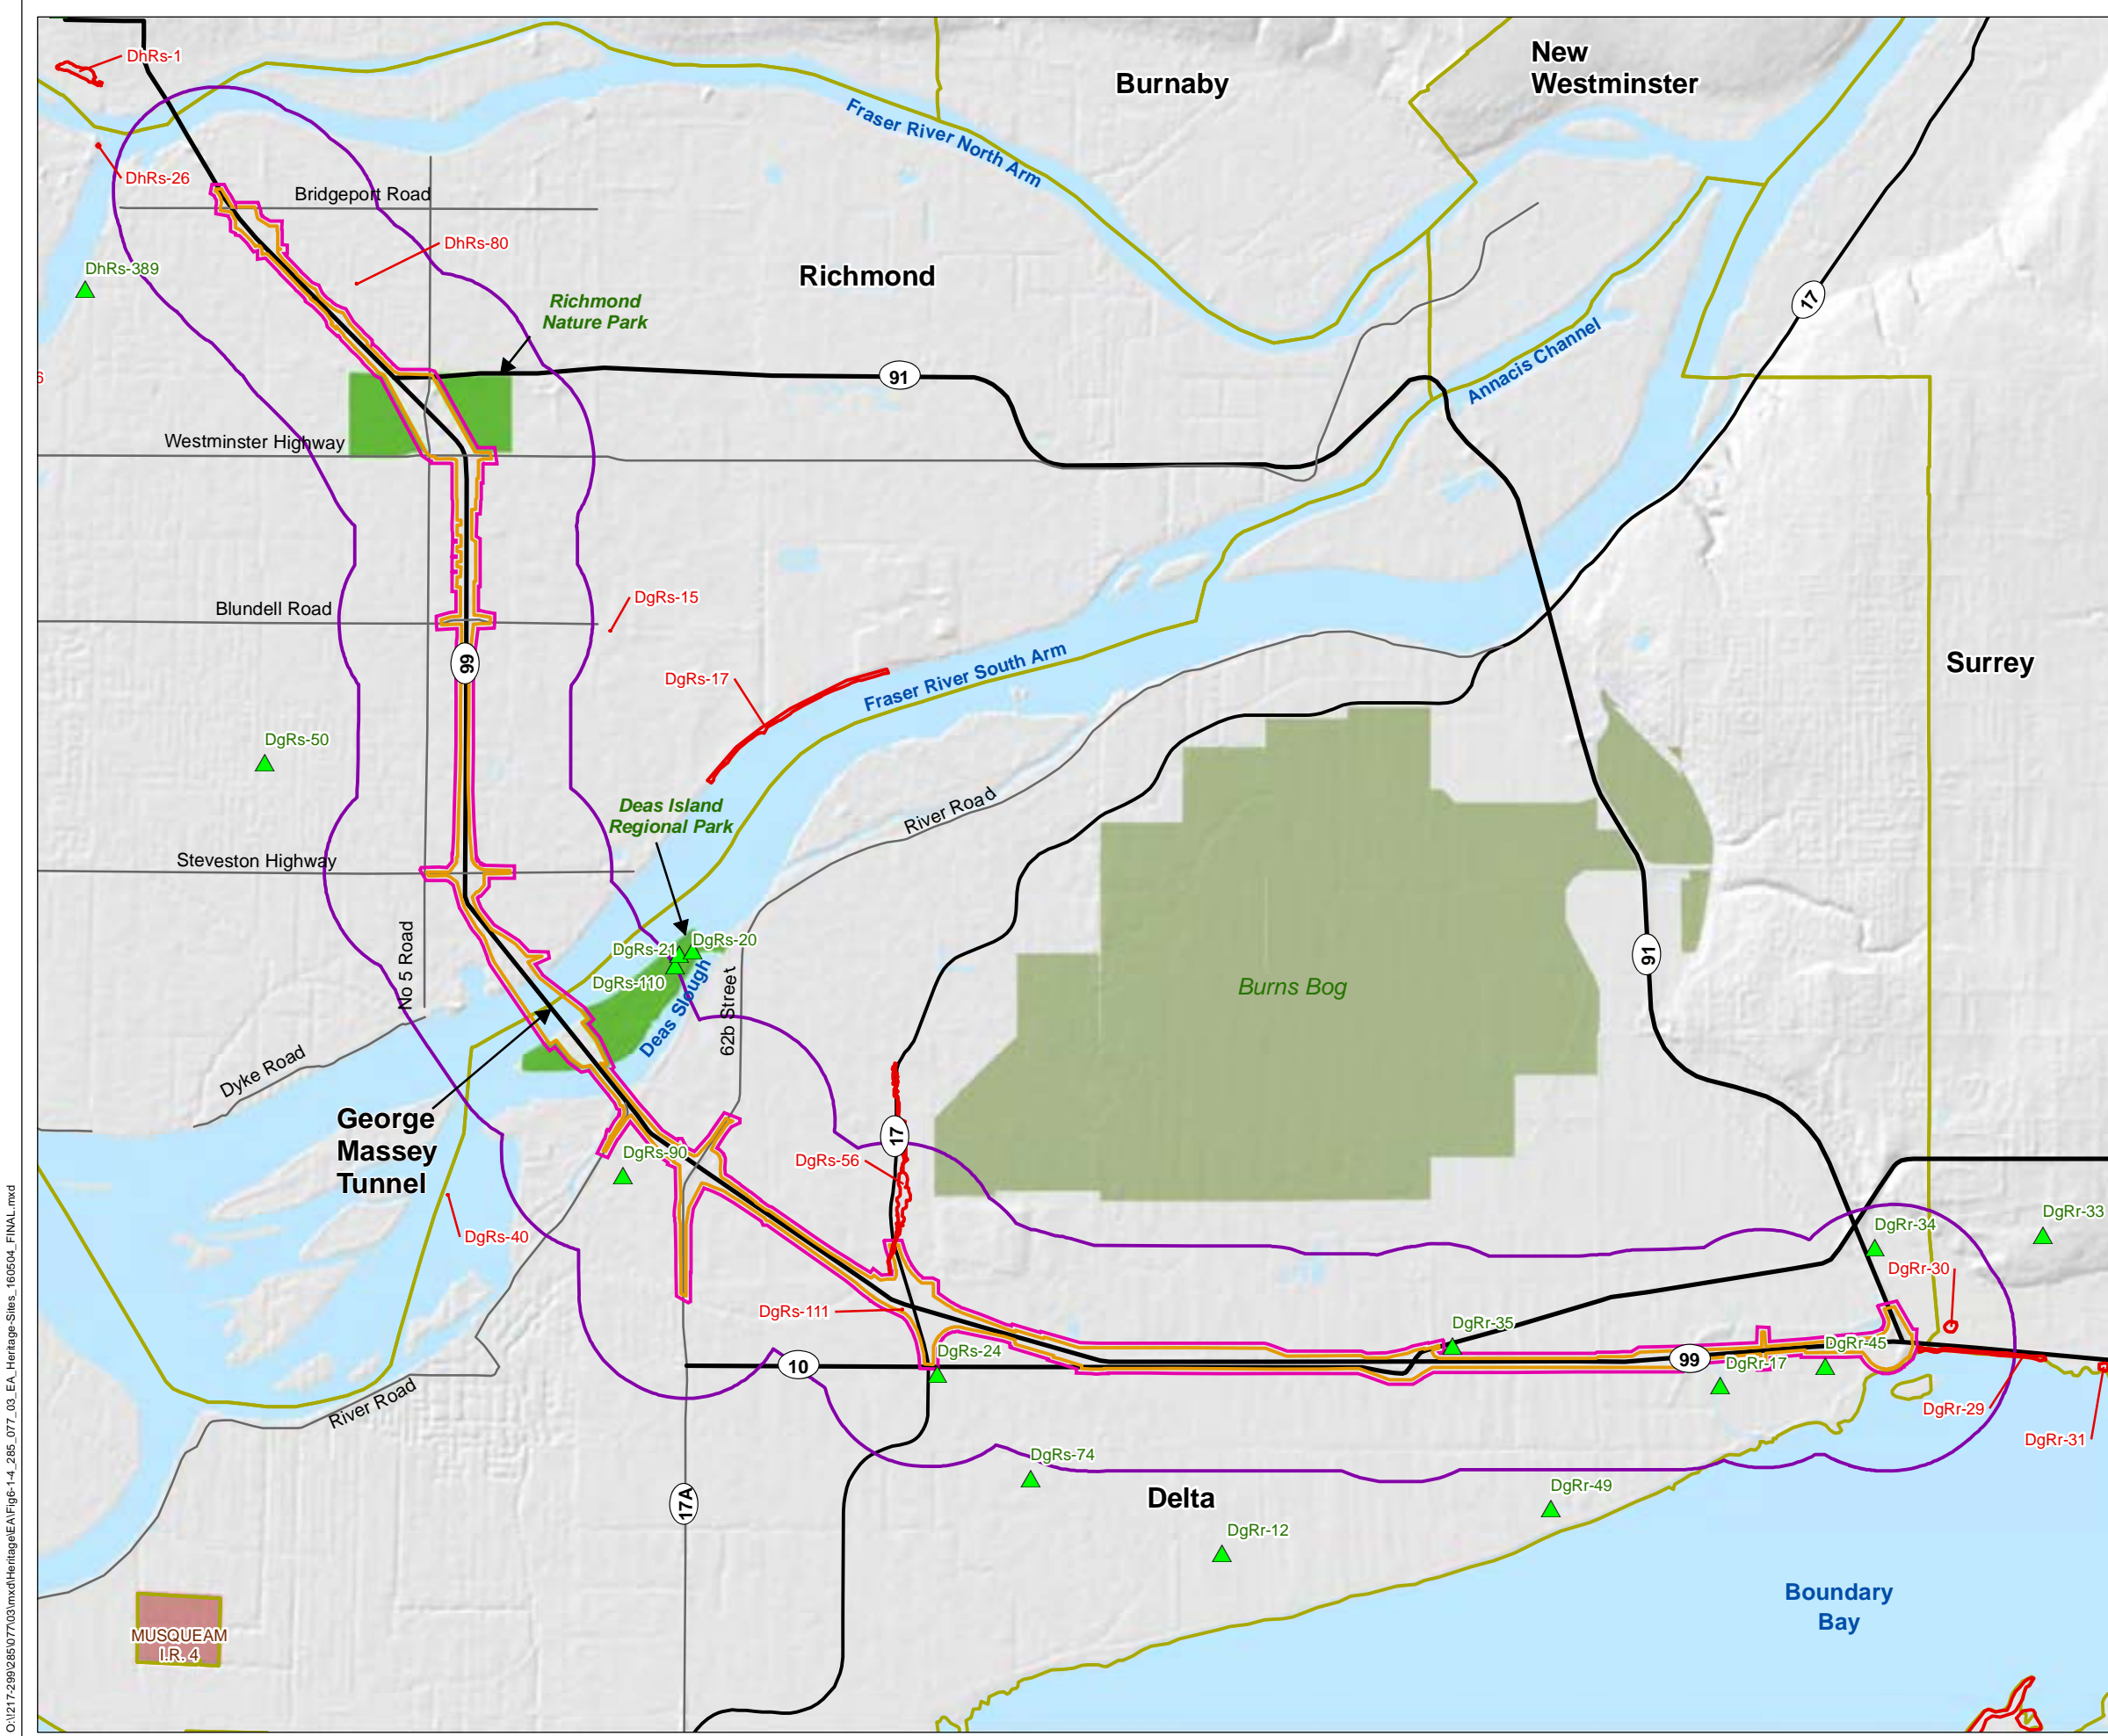

Within the Northwest Coast cultural area (Suttles 1990), the Strait of Georgia region has been the focus of considerable archaeological research (Matson and Coupland 1995, Ames and Maschner 1999). In addition to broader regional studies that have been undertaken over the last 60 years, multiple assessments carried out near the LAA have resulted in the identification of 11 archaeological sites near the LAA (**Figure 6.1-4**). Archaeological and Ethnographic Background information was also presented and discussed in the draft HROA that was shared with the Aboriginal Groups listed in Schedule B of the Section 11 Order for review and comment.

Broader regional assessments in the vicinity of the LAA showcase the cultural history and land use of the region, and provide data on expected site types that may be encountered in the LAA (e.g., Parsons 1981, Ham 1987, Eldridge and Mackie 1993, Millennia Research Ltd. 2005, Golder Associates Ltd. 2012a, b).

During consultation activities for the Project, Aboriginal Groups noted that a historical village, Tle'tinus (also Tq'ltinus and TI'uqtinus), was located within 5 km of the Project, with associated harvesting areas as well as areas used for bathing and spiritual practices. Commenters noted that this village “was a major trade centre and the elders called it little New York”, and that an area in proximity to this village site exists where one of the practices was bathing, mourning and spiritual practices. Harvesting areas were also identified to have occurred near the village site.

Aboriginal Groups also identified areas within the proposed new bridge footings and in and around Deas Slough and Deas Island Regional Park as potential archeological sites, and noted that culture-mourning rituals may have been practiced at Deas Island and/or Westham Island. The existence of a shared village site on the Highway 99 corridor by Crescent Beach where gathering and trading occurred was also noted during consultation.

REPLACEMENT PROJECT**

HERITAGE SITES NEAR THE LAA

| | |
|--------------|------------|
| Figure 6.1-4 | 13/05/2016 |
|--------------|------------|

Heritage Inventory

Figure 6.1-2 shows the areas of archaeological potential within the LAA. The majority of the LAA is characterized as having low archaeological potential due to environmental constraints on human use or on site preservation. However, based on desktop studies and results of the archaeological potential analysis, 18 locations were considered for field inventory (**Figure 6.1-2** and **Table 6.1-4**).

Prior to commencing the field inventory, it was determined that two areas of archaeological potential (areas 9-2A and 9-3B, **Figure 6.1-2**) could not be examined due to existing environmental and infrastructure constraints. During the field inventory it was determined that portions of areas 6-1, 6-2, 9-1, 9-2A, 9-3B, 9-6, 10-1, and 11-1 (**Figure 6.1-2**) were also inaccessible due to environmental, infrastructure, or access constraints. The heritage field inventory data are considered adequate for current assessment purposes. Once the detailed design for the Project is complete, a review will be undertaken to determine the need for and scope of additional archaeological assessment to confirm the absence of heritage resources within the Project alignment.

As outlined in **Table 6.1-4**, the field inventory did not identify any archaeological or historical sites, or heritage wrecks within the LAA. Locations that were inaccessible to subsurface testing, specifically sections of areas 6-1, 6-2, 9-1, 9-2A, 9-3B, 9-6, 10-1, and 11-1, will be reviewed against the detailed Project design to confirm the need for assessment prior to, or during construction.

Subsequent to completion of the field inventory, a field reconnaissance was completed, in December 2015, to account for minor adjustments to the Project concept. The inspection focused on photographing portions of the refined Project alignment in close proximity to areas previously assessed under the HROA and HRIA as having archaeological potential (**Figure 6.1-2**). The visual inspections confirmed that there are areas considered to have archaeological potential, which would require subsurface testing prior to development. Other areas were observed to currently be composed of overfill or have existing culverts. In those areas where conventional archaeological assessment methods and techniques are limited due to access (fill or roadbeds), or areas of planned culvert replacements, archaeological monitoring during land-alterations may be adequate. A summary of the observations made during this field reconnaissance and recommendations on further

action is provided in **Table 6.1-4**. An AIA¹ may be considered at four locations (**Table 6.1-4**) prior to start of construction, depending on the nature of works proposed. Where AIAs are initiated, the Ministry will continue to involve Aboriginal Groups in the assessments. The remaining two locations will be reviewed against detailed Project plans to verify proposed development in relation to archaeological potential and complete further assessment if development is proposed within the archaeological potential zone.

¹ An Archaeological Impact Assessment is required where potential conflicts have been identified between archaeological resources and a proposed development (Ministry of Forests, Lands, and Natural Resource Operations. N.d. Archaeology: What an Archaeological Impact Assessment Entails. Available from: https://www.for.gov.bc.ca/archaeology/preservation_process/archaeological_impact_assessment.htm. Accessed May 2016.

Table 6.1-4 Heritage Inventory Summary

| Area | Results | Further Action? | Comments |
|------|--|-----------------|---|
| 5-1 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 5-2 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 6-1 | The southernmost and northernmost sections were inaccessible to subsurface testing during the field inventory due to dense thickets of blackberry bushes, or slope, fence, and trees. Access was not granted to the section of agricultural field. | Yes | Should land-altering Project developments be proposed in this section of area 6-1, subsurface deposits to be evaluated prior to or during construction. |
| | Negative results in remainder of area 6-1. | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities in the assessed section of area 6-1. |
| 6-2 | A section of area 6-2 adjacent to the Steveston Highway on-ramp to Highway 99 southbound was inaccessible to subsurface testing during the field inventory due to the presence of road shoulder, sidewalk, concrete barrier, traffic signs, above and underground utilities, steep slope, and ditch. | Yes | Should land-altering Project developments be proposed in this section of area 6-2, subsurface deposits to be evaluated prior to or during construction. |
| | Negative results in remainder of area 6-2. | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities in the assessed section of area 6-2. |

| Area | Results | Further Action? | Comments |
|------|--|-----------------|---|
| 9-1 | A section of area 9-1 was inaccessible to subsurface testing during the field inventory due to vegetation, slope, standing water, and utilities. | Yes | Should land-altering Project developments be proposed in this section of area 9-1, subsurface deposits to be evaluated prior to or during construction. |
| | Negative results in remainder of area 9-1 | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities in the assessed section of area 9-1. |
| 9-2A | Inaccessible to subsurface testing due to narrow road shoulder, concrete barrier, above and underground utilities, steep slope, and ditch. | Yes | Should land-altering Project developments be proposed, subsurface deposits to be evaluated prior to or during construction. |
| 9-2B | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 9-3A | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 9-3B | Inaccessible to subsurface testing during the field inventory due to narrow road shoulder, concrete barrier, above-ground and underground utilities, slope, ditch, and existing walking trail. | Yes | Should land-altering Project developments be proposed, subsurface deposits to be evaluated prior to or during construction. |
| 9-4 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 9-5 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |

| Area | Results | Further Action? | Comments |
|------|---|-----------------|---|
| 9-6 | A section of area 9-6 was not assessed due to the presence of the Highway 17A shoulder, bus stop/pull out, steep slope and ditch, and above-ground and underground utilities. | Yes | Should land-altering Project developments be proposed in this section of area 9-6, subsurface deposits to be evaluated prior to or during construction. |
| | Negative results in remainder of area 9-6. | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 9-7 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 9-8 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 10-1 | Inaccessible to subsurface testing during field inventory due to underground utilities, proximity to Highway 17A to the west, and slope and ditch to the east. | Yes | Should land-altering Project developments be proposed, subsurface deposits to be evaluated prior to or during construction. |
| 10-2 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |
| 11-1 | Inaccessible to subsurface testing due to underground utilities, proximity to Highway 17A to the west, and slope and ditch to the east. | Yes | Should land-altering Project developments be proposed, subsurface deposits to be evaluated prior to or during construction. |
| 11-2 | Negative | No | Archaeological Chance Find Procedures should be implemented during land-altering construction activities. |

Note: Negative = no heritage resources found.

| Area | HROA Potential | Comments |
|--------------------------------|--|---|
| 5 Highway 99 and unnamed creek | <ul style="list-style-type: none"> Potential based on proximity to watercourse. | <ul style="list-style-type: none"> Highway 99 appears only slightly raised with fill from the surrounding terrain. Two large culverts run under the highway. Conduct Archaeological Impact Assessment if required. Undertake archaeological monitoring during culvert removal, if applicable. |
| 6 Highway 99/91 Loop | <ul style="list-style-type: none"> Potential based on watercourse. Proximity to known archaeological sites (DgRr-29 and 30). | <ul style="list-style-type: none"> Large amount of fill has been placed within the loop and used to construct the interchange. Conduct Archaeological Impact Assessment if required. Conduct work under a chance find protocol, if development is to occur within fill area. |

6.1.3 Potential Effects

This section discusses anticipated interactions of Project components and activities with heritage resources, and potential effects of such interactions. Information on mitigation of potential effects, including Project design measures to avoid adverse effects, is provided in **Section 6.1.4 Mitigation Measures**. Potential residual effects (i.e., effects remaining following the implementation of mitigation measures) are described in **Section 6.1.5 Residual Effects and their Significance**. A discussion of potential cumulative effects on heritage resources is presented in **Section 6.1.6 Cumulative Effects and their Significance**.

6.1.3.1 Project Interactions and Potential Effects

As shown on **Table 6.1-4**, no historical or archaeological heritage sites were identified in the LAA. Therefore, no Project interactions or potential Project-related effects are anticipated. Furthermore, a determination of the significance² of heritage resources using the criteria established in the *British Columbia Archaeological Impact Assessment Guidelines* (B.C. FLNR 1998) was not conducted.

There is potential for currently-unidentified archaeological and heritage resources, including previously-unknown and unrecorded heritage sites in construction areas covered by infrastructure installed as part of the original development of the Highway 99 corridor, to be encountered during Project activities. Measures to mitigate potential effects on such resources, including the development of a chance-find procedure as part of an Archaeological and Heritage Resources Management Plan, are discussed in **Section 6.1.4**.

6.1.4 Mitigation Measures

A hierarchical approach based on avoidance of potential effects followed by minimization or reduction of unavoidable effects was used in identifying strategies to mitigate potential Project-related effects on heritage resources.

Measures to avoid potential effects have been/will be incorporated into project considerations such as site and route selection, Project design, and construction and operation procedures, and practices. Where potential effects cannot be avoided through project considerations, standard mitigation measures, BMPs, and construction and operation environmental management plans (EMPs) will be implemented to minimize potential Project-related effects or reduce them to acceptable levels. These measures are described in general terms below.

² Heritage sites are commonly evaluated using criteria that describe heritage value in terms of their significance. This use is distinct and separate from the use of significance in the residual effects assessment.

6.1.4.1 Avoidance

Since no heritage resources were identified in the LAA, no specific mitigation measures pertaining to the preservation of existing sites are required.

6.1.4.2 Minimization

Archaeological and Heritage Resources Management Plan

An Archaeological and Heritage Resources Management Plan will be developed as part of the Construction Environmental Management Plan (**Section 12.0 Management Plans**), and will include a chance-find procedure to be implemented during construction activities that involve ground disturbance. The chance-find procedure will outline actions to be taken by construction personnel if previously-unknown and unrecorded heritage resources, including those that may be present in areas covered by infrastructure installed as part of the Highway 99 corridor development, are encountered during Project construction. It will also include a human-remains protocol to be followed should human remains be encountered during Project construction activities. The plan will be developed in accordance with existing Ministry policies and procedures, with guidance, where applicable, from the B.C. Archaeology Branch and in consultation with Aboriginal Groups. The implementation of a chance-find procedure is consistent with regulatory requirements and recognized good practices, and is expected to effectively address potential Project-related effects on previously-unidentified heritage resources.

Additional Archaeological Surveys

Certain areas with archaeological or compromised archaeological potential were partially inaccessible during the field inventory (areas 6-1, 6-2, 9-1, 9-2A, 9-3B, 9-6, 10-1 and 11-1; **Figure 6.1-2**) or identified during subsequent field reconnaissance. These areas will be reviewed against the detailed Project design to confirm the need for further assessment. If required, further assessment of these sites will be undertaken under the terms and conditions of an *HCA* permit prior to or during Project construction.

6.1.5 Residual Effects and their Significance

Residual effects are those adverse effects that remain after implementation of mitigation measures. Since no heritage resources were identified in the LAA, and any potential effect on previously-unknown heritage resources are expected to be addressed effectively through the implementation of a chance-find procedure, no Project-related residual effects on heritage resources are anticipated.

6.1.6 Cumulative Effects and their Significance

Since no Project-related effects on heritage resources are anticipated, a cumulative effects assessment is not required.

6.1.7 Follow-up Strategy

As no residual effects on heritage resources are predicted, no follow-up program is proposed.

APPENDIX A

Heritage Conservation Act Permit Application Communications

Communications with Aboriginal Groups is a requirement of the *HCA* permit application. The following summarizes the groups included in that process.

In July 2014, the B.C. Archaeology Branch forwarded an *HCA* permit application, which encompassed the Highway 99 right-of-way and associated interchanges from Bridgeport Road to the Canada–U.S. border, to the following Aboriginal communities and organizations: Katzie First Nation, Kwantlen First Nation (Seyem' Quantlen Business Group), Musqueam Indian Band, Semiahmoo First Nation, Squamish Nation, Stó:lō Nation (SRRMC), Tsawwassen First Nation, and Tsleil-Waututh Nation. These communities were provided 30 days to review and comment on the proposed methods to be employed during the field work, analysis, and reporting stages of the archaeology program. The Ministry provided copies of the *HCA* permit application and the *HCA* permit to Cowichan Tribes, Halalt First Nation, Hwlitsum, Penelakut Tribe, Lyackson First Nation, Lake Cowichan First Nation and Stz'uminus First Nation.

In addition, the Ministry provided copies of the draft HROA to the Cowichan Tribes; Halalt First Nation; Hwlitsum; Katzie First Nation; Kwantlen First Nation; Lake Cowichan First Nation; Lyackson First Nation; Musqueam Indian Band; Penelakut Tribe; Semiahmoo First Nation; Squamish Nation; People of the River Referrals Office; Stó:lō Nation (Aitchelitz First Nation, Leq'a:mel First Nation, Matsqui First Nation, Popkum First Nation, Skawahlook First Nation, Skowkale First Nation, Shxwha:y Village, Squiala First Nation, Sumas First Nation, Tzeachten First Nation, Yakweakwioose Band); Stó:lō Tribal Council (Chawathil First Nation, Cheam Indian Band, Kwantlen First Nation, Kwaw'Kwaw'Apilt First Nation, Scowlitz First Nation, Seabird Island First Nation, Shxw'ow'hamel First Nation, Soowahlie Band); Stz'uminus First Nation; Tsawwassen First Nation; and Tsleil-Waututh Nation for review.

Notification of the heritage resources field assessment was provided to all Schedule B Aboriginal Groups identified in the Section 11 Order and to Stó:lō Nation (SRRMC). The assessment was carried out under *HCA* permit 2014-0201. Applicable First Nations permits were sought and obtained.

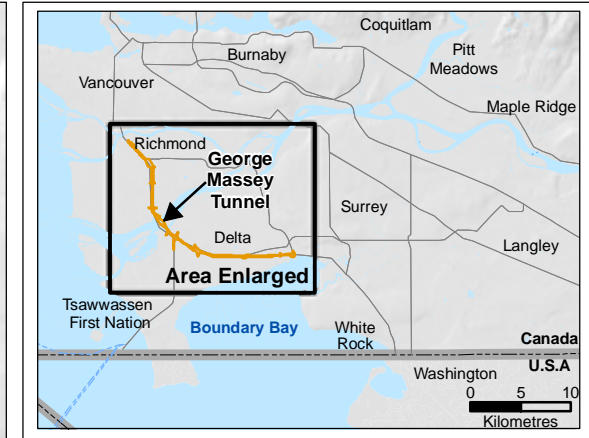

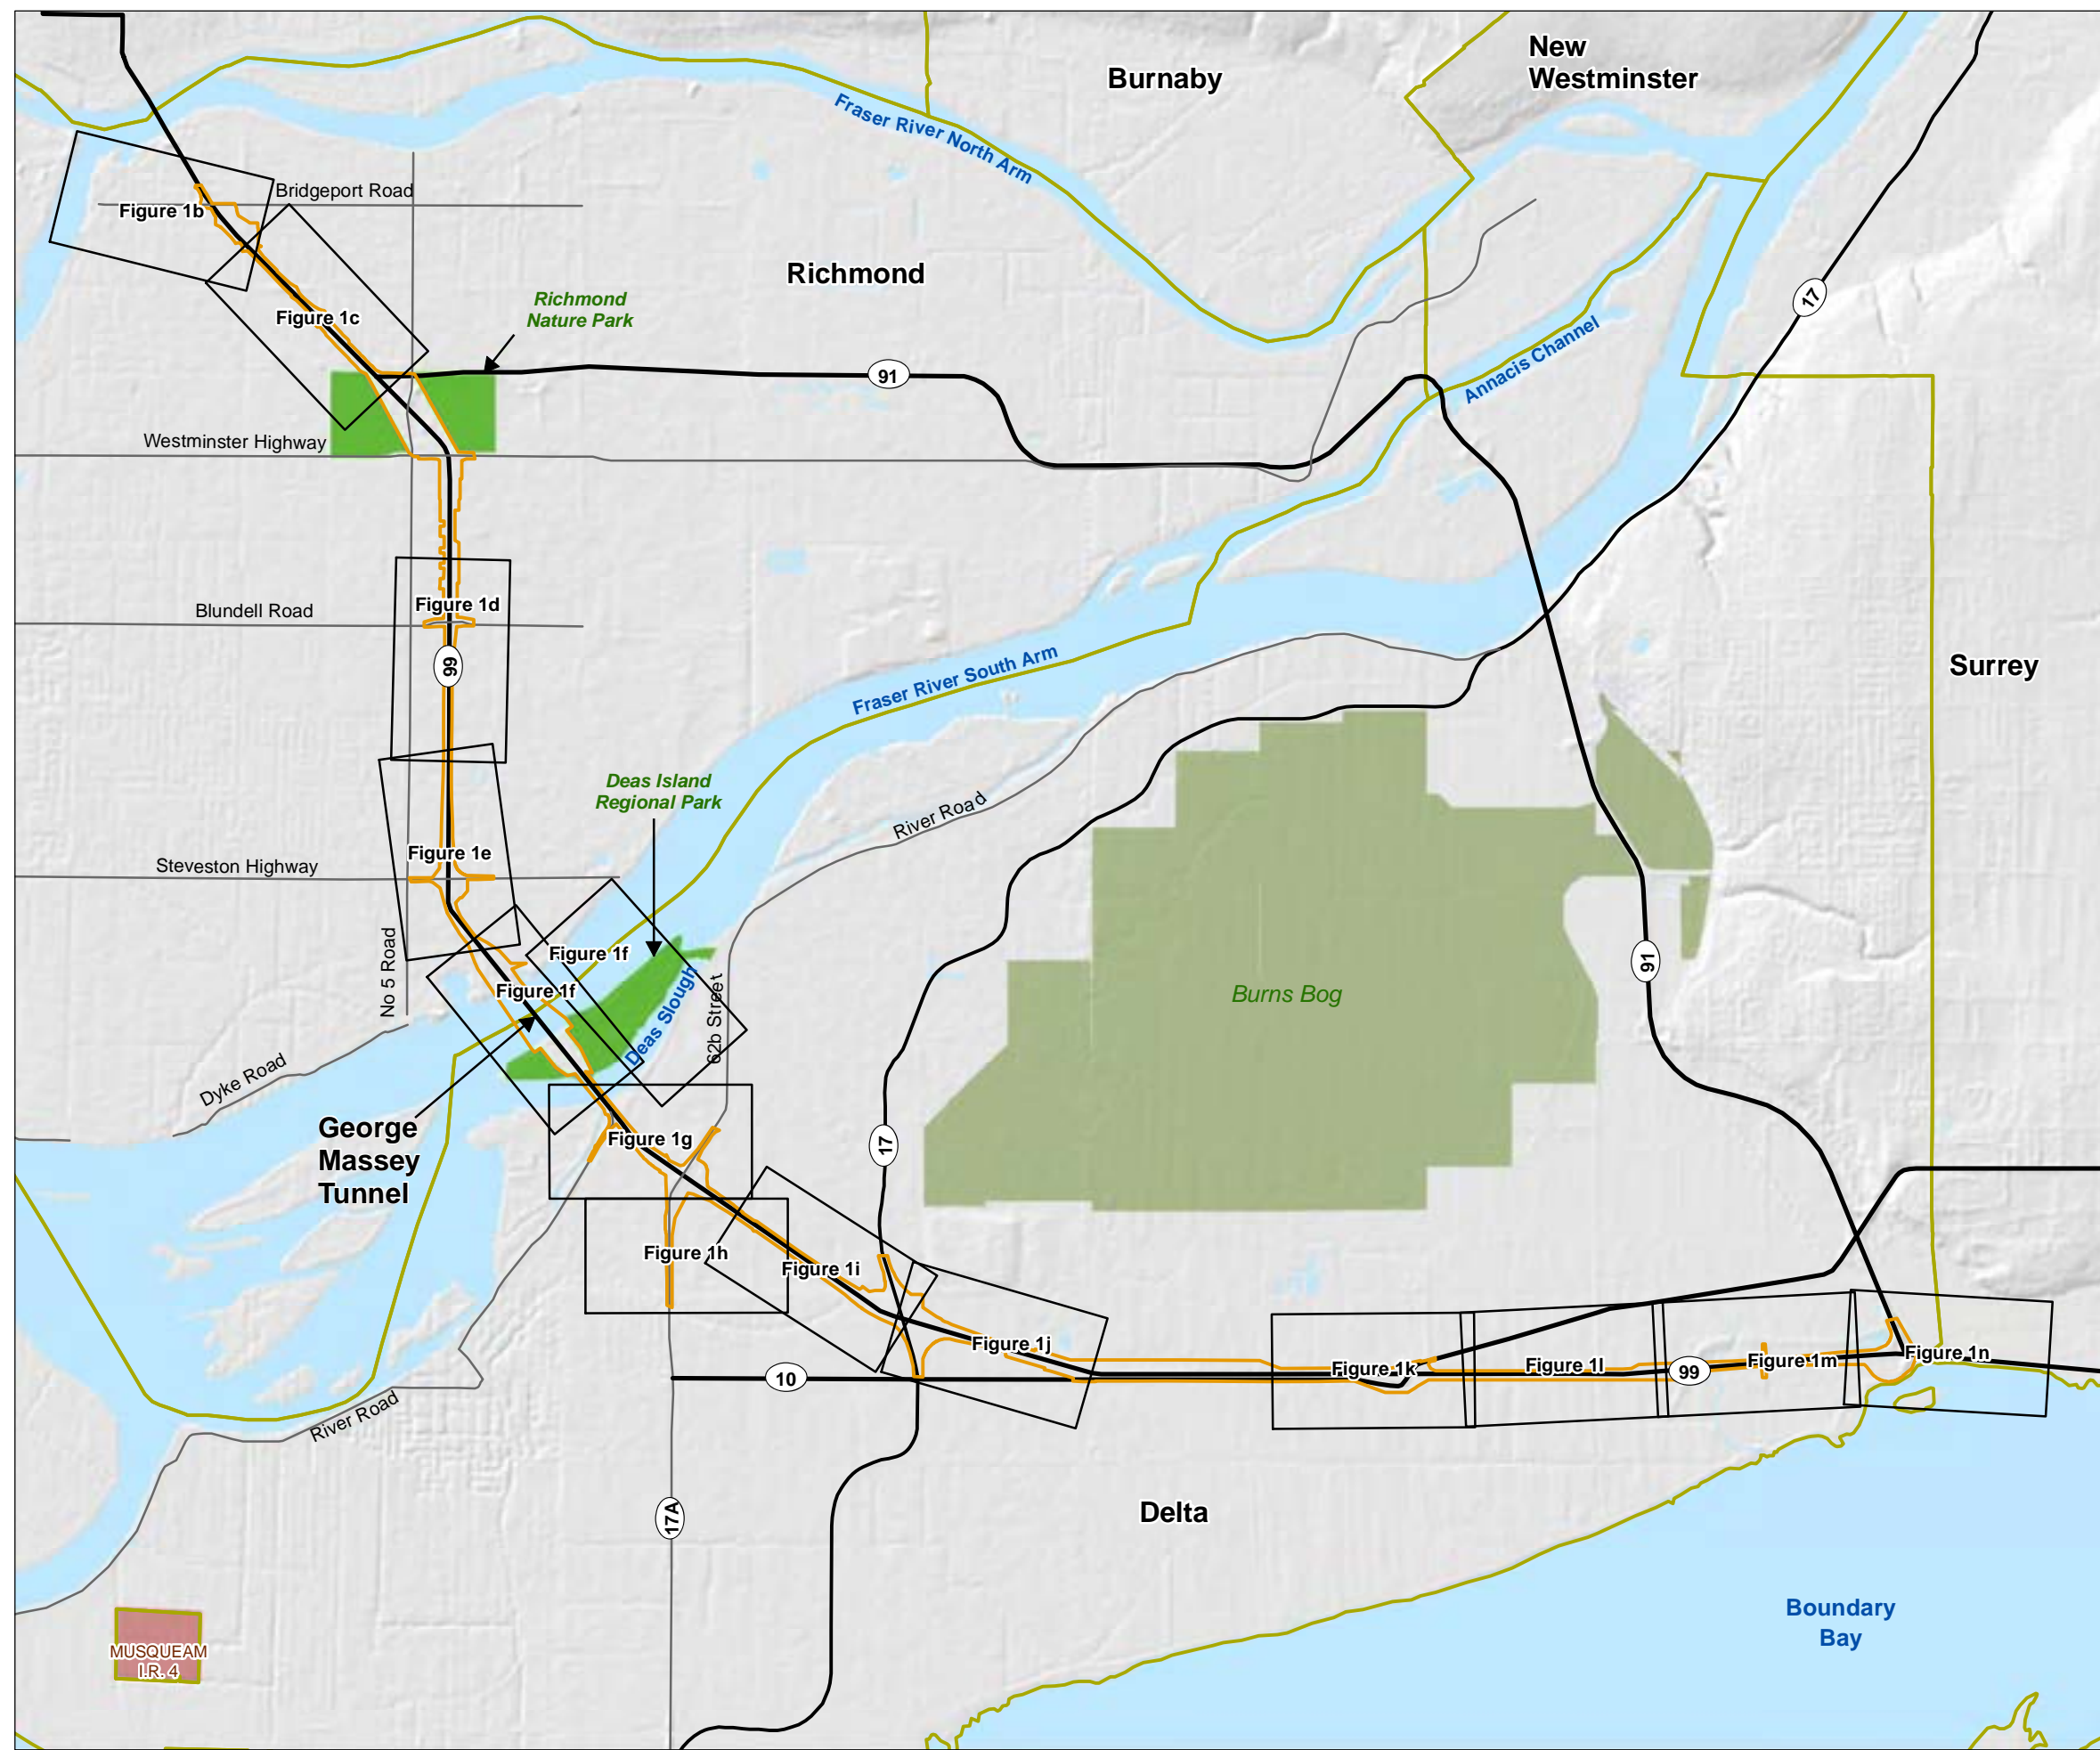

All Schedule B Aboriginal Groups were invited to participate in the heritage resources field investigation.

Representatives from the Cowichan Tribes, Katzie First Nation, Kwantlen First Nation, Lake Cowichan First Nation, Musqueam Indian Band, Penelakut Tribe, Semiahmoo First Nation, Stz'uminus First Nation, Tsawwassen First Nation, and Tsleil-Waututh Nation participated in the heritage resources field assessment.

7.0 Health Effects Assessment Highlights:

- Predicted Project-related improvements in local and regional air quality, primarily due to reductions in congestion-related idling, are anticipated to have a positive effect on human health.
- Implementing mitigation measures to address traffic-related noise during Project operation will avoid increases in human health risk and in some cases will result in improvements over current conditions.
- Proven mitigation measures, effectively used during the construction of projects such as the South Fraser Perimeter Road and Port Mann / Highway 1 Improvement project, will be implemented to ensure that temporary increases in ambient noise levels and air emissions during construction do not result in health effects.
- The Project is anticipated to improve health equity by providing disadvantaged groups with better access to reliable transportation options.
- The Project will result in additional health benefits related to greenhouse gas emissions reductions, increased opportunities for active and public transportation, improved traffic safety, improved connectivity and access, improved emergency response, and economic development opportunities.
- Future Project-related consultation with Aboriginal Groups represents an important opportunity to address health interests specific to Aboriginal communities that have been identified in the health impact assessment.
- Planned future engagement with a broad range of stakeholders will help to optimize Project benefits associated with improvements to active transportation options such as cycling, addressing safety and security considerations and emergency response.
- No Project-related residual or cumulative effects on human health are expected.

This section presents the results of the assessment of potential Project effects on human health and includes the rationale for selecting human health as a valued component (VC), identification of Project-related effects, proposed approaches to mitigation, and evaluation of residual Project-related and cumulative effects.

In addition, a health impact assessment (HIA) was undertaken to support ongoing Project planning and development. Information obtained through the HIA process has been used to support the assessment of the Project and recommendations emerging from the HIA have guided the development of mitigation measures throughout the Application with the goal of enhancing Project-related health benefits.

7.1 Human Health

The assessment of the health VC focuses on potential changes in human health, supported by a human health risk assessment (HHRA), and focuses on human health considerations associated with Project-related changes in the intermediate components air quality and noise.

7.1.1 Context and Boundaries

This section describes the context for assessment of Project-related effects on human health in terms of Project setting, and defines the spatial, temporal, administrative and technical assessment boundaries. Rationale for selecting the assessment boundaries as defined is also provided.

No jurisdictional, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects, accessibility constraints, or gaps in data that could limit the ability to predict the effects of the Project were identified; therefore, administrative or technical boundaries do not exist for this VC and are not discussed further.

7.1.1.1 Assessment Context

Changes in road traffic can influence local air quality and community noise levels, which can affect human health. In addition, ground-borne vibration, potentially experienced by communities and properties in close proximity to highways (and highway construction activities) may be of potential concern and source of annoyance. Additional information supporting the selection of human health as a VC is provided in **Section 3.1 Issues Scoping and Selection of Valued Components**.

7.1.1.2 Methodology

The assessment of human health follows the general methodology described in **Section 3.0 Assessment Methodology** and applied to all VCs. Building on this approach, the assessment of human health was designed to focus on health effects linked to changes in air quality and exposure to noise and vibration. In this context, the assessment of human health focuses on two sub-components as presented in **Table 7.1-1**.

Table 7.1-1 Sub-components of Human Health

| Sub-component | Rationale for Selection |
|--|--|
| Air emissions (Health effects linked to changes in air quality) | The Project involves potential changes in volume and composition of traffic along the Highway 99 corridor, which could change air emissions, and in turn, affect human health. Some airborne chemicals may deposit onto soil and plants which are subsequently ingested by animals. Human exposure to soil, plants and animals affected by airborne chemical deposition may result in human health effects. |
| Noise and vibration (Health effects linked to exposure to noise and vibration) | Project-related change in ambient noise conditions during construction and operation, and ground-borne vibration during construction may affect human health. |

Effects to human health from food quality (e.g., fish) were considered for inclusion as a VC. Bed sediments in some areas of the Fraser River South Arm contain trace elements, PAHs, and other organic contaminants at levels that may exceed Canadian Council of Ministers of the Environment (CCME) sediment quality guidelines (SedQGs). Historically, samples collected in lower flow sub-areas of the South Arm have routinely exceeded CCME SedQG for arsenic, chromium, and copper (Swain and Walton 1991, 1993, Brewer et al. 1998). These trace elements occur naturally at higher concentrations in the finer-textured (silt and clay) fractions of bed sediments, which are more common in Deas and Green Slough, but the sediments in the main channel of the Fraser River South Arm have very limited fines (generally less than 2 percent by weight) as a result of the higher bottom currents and generally do not accumulate trace element or various contaminants of human origin. Baseline sediment quality data for the Fraser River in the Project areas, as discussed in **Section 4.2 Sediment and Water Quality**, confirm that sediments within Deas Slough may contain arsenic, chromium and copper at concentrations higher than CCME SedQC. Riverbed sediment samples, however, collected from within the LAA directly adjacent to the Tunnel (except near the river banks) were coarse-grained, with very low concentrations of chemical constituents. An important conclusion is that the riverbed sediments within the main channel of the Fraser River South Arm, near the Tunnel, that are expected to be re-suspended during Tunnel removal are not contaminated based on comparisons with CCME SedQC. Given that no substances were observed to occur in sediment samples collected from the riverbed near the Tunnel at concentrations suggestive of contamination, the Project-related re-suspension of this sediment is not expected to alter the extent to which any contaminants enter living resources such as edible fish. Therefore, a human health risk assessment for this exposure and effects pathway was not deemed necessary, and not included in this assessment.

Indicators chosen for the assessment of Project-related effects on the two human health sub-components, and the rationale for their selection are presented on **Table 7.1-2**. These indicators were used to assess trends in human health within the assessment area and evaluate potential Project-related effects. The selection of indicators was guided by a variety of considerations, including categories of health indicators commonly associated with transportation projects.

Table 7.1-2 Indicators for Assessment of Human Health Sub-components

| Sub-component | Indicator | Rationale for Selection |
|---------------------------------|---|---|
| Air emissions | Acute inhalation risk quotient (chemical exposure ÷ chemical exposure limit) for air concentrations of individual chemicals and potentially interacting chemical groups over short-term averaging times. | Assesses the potential for acute health effects following short-term inhalation exposures. |
| | Chronic inhalation risk quotient for air concentrations of individual chemicals and potentially interacting chemical groups over long-term averaging times. | Assesses the potential for chronic health effects following long-term inhalation exposures. |
| | Chronic risk quotient for multi-media exposures (concentrations of chemicals in soil and plants following airborne deposition and concentrations of chemicals in animal tissue following soil and plant consumption). | Assesses the potential for chronic health effects from long-term oral and dermal exposures to chemicals in media other than air (soil, plants, and livestock). |
| Atmospheric noise and vibration | Annoyance associated with highway noise (as measured by the expected percent of community that is “highly annoyed” (%HA) as predicted from day-night noise levels (expressed as L_{dn}). | A primary indicator of the potential for adverse health effects based on the established relationship between day-night noise levels (L_{dn}) and the per cent of highly annoyed (%HA) individuals. High levels of annoyance can lead to stress and other related adverse health effects. |
| | Sleep impairment based on nighttime sound level (L_n). | Sleep disturbance and awakenings can result in adverse health effects associated with sleep impairment. Effects may include tiredness, lack of focus, among others. |
| | Ability to maintain adequate speech comprehension based on daytime sound level (expressed as L_d). | Speech interference can negatively affect normal communication. Of particular importance is the potential impact on learning effectiveness associated with high indoor noise levels in schools and daycares. |
| | Annoyance associated with ground-borne vibration, based on expected magnitude relative to the threshold of perception. | Vibration can be felt and cause rattles in indoor spaces. This can cause increased levels of annoyance in residential buildings. Increased annoyance can lead to stress related health effects. |

7.1.1.3 Assessment Boundaries

The assessment boundaries for human health are defined below.

Spatial Boundaries

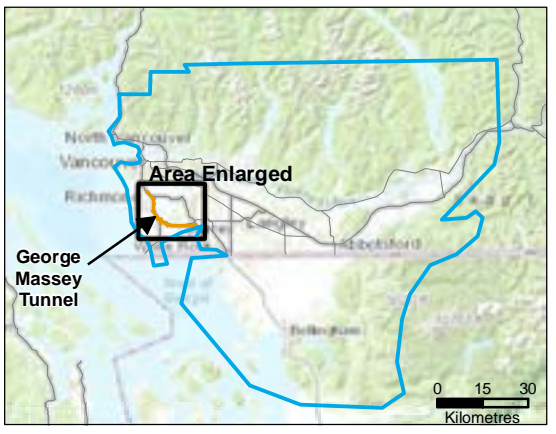

The local assessment areas (LAA) and regional assessment areas (RAA) for human health associated with air quality, and noise and vibration are summarized in **Table 7.1-3** and shown in **Figure 7.1-1**. The boundaries of the assessment area take into account the scale and spatial extent of potential effects that are appropriate for the two sub-components. Assessment of human health effects associated with air quality adopted the spatial boundaries defined in **Section 4.9 Air Quality**. Assessment of human health effects associated with noise and vibration adopted the spatial boundaries identified in **Section 4.10 Atmospheric Noise**.

Table 7.1-3 Spatial Boundary Definitions for Human Health

| Spatial Boundary | Description of Assessment Area |
|---------------------------------------|--|
| Local Assessment Area (LAA) | Air emissions: the Project alignment, plus a one-kilometre zone around the Project alignment. |
| | Noise: the Project alignment, plus 500 m from either side of the Project alignment, except in the vicinity of the new bridge where it extends 1,600 m from either side of the Project alignment. |
| Regional Assessment Area (RAA) | Air emissions: lower Fraser Valley airshed, bounded to the north by North Vancouver, to the east by Hope, and to the south by the Cascade Mountains in Washington |
| | Noise: Potential Project-related change in noise conditions are expected to be limited to within the LAA; therefore a RAA has not been defined. |

In general, the LAA encompasses the area within which the Project is expected to most likely interact with, and potentially have an effect on human health. The RAA for air quality provides a regional context for the assessment of Project-related effects and also encompasses the area within which the residual effects of the Project on human health may combine with the effects of other projects and activities to potentially result in cumulative effects.

Temporal Boundaries

Temporal boundaries for the assessment of Project-related effects on human health were established based on the potential for each phase of the Project to interact with and have an effect on human health. As discussed in **Section 3.1 Issues Scoping and Selection of Valued Components**, both the construction and operational phases of the Project include components and activities that could interact with and affect human health within the Project alignment; therefore, the following temporal boundaries were defined for human health assessment:

- Existing conditions
- Project construction (including Tunnel decommissioning)
- Project operation (including maintenance)

Temporal characteristics of the Project phases are discussed in **Section 1.1 Description of the Proposed Project**. Specific considerations for the temporal variability in air quality, and noise and vibration effects are presented in **Section 4.9 Air Quality** and **Section 4.10 Atmospheric Noise**, respectively.

Administrative Boundaries

No political, economic, or social constraints that could impose limitations on the assessment of potential Project-related effects on human health have been identified; therefore, no administrative boundaries are defined.

Technical Boundaries

No technical boundaries have been identified that could impose limitations on the assessment of potential Project-related effects on human health.

7.1.2 Existing Conditions

This section provides an overview of the methodology for collecting baseline data, and describes the existing conditions of human health within the assessment areas. An overview of the regulatory context for management of human health as relevant to the Project is also provided.

An appreciation of the existing conditions facilitates the identification of potential future changes associated with the Project. In describing existing conditions, it is assumed that the time period between the present and expected date of completion of the proposed work is sufficiently short that natural trends are not likely to result in appreciable changes in air quality or noise in the intervening period. In addition, it is assumed that human-caused trends that could affect either air quality, noise exposures, or other drivers of human health by the time the Project is constructed or complete, are expected to be minor.

With respect to air quality, it is generally expected that air quality in the assessment area will improve based on technological advancements in transport vehicles (e.g. based on greater percentages of electrical vehicles in use). With respect to noise, any trend is likely to be driven by changes in traffic density and road speeds, which tend to counteract each other. Trends in health status – for example, based on statistical trends in longevity or specific facets of morbidity and mortality – tend to be discernible only over longer periods, and are thus not considered explicitly here.

The existing conditions described in the following sections reflect the cumulative influences on human health of a large number and variety of past and present projects and activities, based on trends in urban development and human migrations, transportation, land use, industrialization, access to food and other basic resources, and health care capabilities and access..

7.1.2.1 Baseline Data Collection

In 2014, the Ministry initiated desktop studies to support the evaluation of Project effects on health, including a quantitative human health risk assessment of changes predicted to as a result of potential changes in air quality, and noise and vibration within the LAA. The assessment of Project-related effects on human health was based on the air quality and noise studies described in **Section 4.9 Air Quality** and **Section 4.10 Atmospheric Noise** of this Application.

Information supporting the assessment of potential effects, of project-related change in air quality and noise conditions and vibration, on human health is based on the following sources:

- Air quality:
 - Acute and chronic air concentrations and deposition rates: Levelton Consultants Ltd.(2014).
 - Baseline health status data: Statistics Canada (2008; 2013a; 2013b), Canadian Cancer Society (2013), Fraser Health Authority (2012).
 - Exposure characterization data: Health Canada (2012), and U.S. EPA (2005).
 - Exposure limit data: Agency for Toxic Substances and Disease Registry (ATSDR, 2013); British Columbia Ministry of Environment (B.C. MOE, 2013); California Office of Environmental Health Hazard Assessment (OEHHA, 2008; 2011; 2014); CCME (2012); Health Canada (2010a); International Agency for Research on Cancer (IARC 2014); Metro Vancouver (2011); Texas Commission on Environmental Quality (TCEQ 2015; 2014); United States Environmental Protection Agency (U.S. EPA 2012, 2014); Netherlands National Institute of Public Health and the Environment (RIVM 2001); WHO (2000, 2006).

- Noise and vibration:
 - Calculation of %HA: American National Standards Institute (2005), Michaud et al. (2008) and International Standards Organization (2003).
 - Assessment of ground-borne vibration: United States Federal Transit Administration (2006).
 - Speech comprehension and sleep impairment: World Health Organization (1999, 2009).

The following guidance documents on human health risk assessment were considered in the assessments of Project-related effects on human health:

- *Guidance on Human Health Risk Assessment for Environmental Impact Assessment in Alberta* (Alberta Health and Wellness 2011).
- *Useful Information for Environmental Assessments* (Health Canada 2010b).
- *Guidance for Evaluating Human Health Impacts in Environmental Assessment* (Health Canada 2011).
- *Human Health Risk Assessment Protocol for Hazardous Waste Combustion Facilities* (U.S. EPA, 2005).
- *Transit Noise and Vibration Impact Assessment* (U.S. Federal Transit Administration 2006).

7.1.2.2 Regulatory Context

Various regulatory and public agencies have oversight of air quality health issues, including the B.C. Ministry of Environment, Metro Vancouver, and the B.C. Ministry of Health, particularly as represented by the Vancouver Coastal Health and Fraser Valley Health authorities. The Canadian Council of Ministers of the Environment (CCME) has also taken a lead role in managing the effects of air pollution on Canadians, through the development and refinement of the CCME Canada-wide Standards and Canadian Ambient Air Quality Standards.

The World Health Organization (WHO), Health Canada, the Ministry, and various other agencies recognize that noise generated from transportation and other activities can result in effects on human health and interfere with daily activities (Swift, 2010).

There are no formal federal or provincial standards available to assess the health effects of community noise levels; however, there are internationally recognized standards for the evaluation of noise effects on individuals and communities that were identified for the HHRA, mainly the U.S. EPA (1974), WHO (1999), and International Standards Organization (ISO), that have been adopted in Canada (CAN/CSA ISO). These agencies generally base their guidance

on previously demonstrated connections between various metrics of shorter- to longer-term noise exposure and (i) the estimated percent of highly annoyed (%HA) residents, (ii) sleep disturbance, and (iii) interference with speech comprehension and/or learning.

7.1.2.3 Existing Conditions

Air Quality

Overview

As discussed in **Section 4.9 Air Quality**, existing air quality within the LAA was estimated based on background air quality data analysis, and traffic and emissions model outputs. Air quality findings are summarized as:

- Carbon monoxide, nitrogen dioxide, benzene, and benzo(a)pyrene exceed the most stringent Ambient Air Quality Objectives (AAQOs).
- The maximum one-hour 98th percentile of carbon monoxide concentrations does not exceed the objective and existing carbon monoxide levels exceed the one-hour AAQO less than 0.2% of the time.
- While nitrogen dioxide exceeds the most stringent AAQO, it does not exceed the federal one-hour objective.

Human Health Considerations

Exposure limits recommended by regulatory agencies, including Health Canada, the World Health Organization (WHO), and the U.S. EPA are appropriate scientific and epidemiological estimates of safe levels of chemical exposure. Comparison of predicted chemical exposures (air concentrations in $\mu\text{g}/\text{m}^3$) to corresponding exposure limits provide the major portion of interpretations for conclusions about human health implications of air quality.

Risk quotient (RQ), a ratio (exposure divided by exposure limit) that reflects the relative magnitude of predicted exposure above or below the exposure limit, is typically used to assess potential health effects of the presence of specific chemicals in ambient air. Using the RQ approach, it is concluded that no adverse health effects are expected where RQ values are equal to or below 1.0.

Risk quotients for contaminants of potential concern (COPC) under existing conditions were calculated based on ambient air concentrations estimated through background air quality data analysis, and traffic and emissions model outputs as discussed in **Section 4.9 Air Quality**.

Existing conditions are as follows:

- The majority of RQ values determined for acute and chronic inhalation exposure to individual chemicals were less than or equal to 1.0.
- All RQ values determined for farmers growing plants and raising livestock within the LAA were less than 1.0.
- The maximum acute and chronic RQ values for residential exposure to nitrogen dioxide were slightly greater than 1.0 (1.1 and 1.2).
- Acute RQ values marginally above 1.0 (from 1.3 to 1.4) estimated for agricultural, residential, and recreational receptors when combined exposure to chemicals in the respiratory irritant group was assumed (i.e., acetaldehyde, naphthalene, nitrogen dioxide, sulphur dioxide).
- The individual RQ value for nitrogen dioxide was the most significant contributor to the respiratory irritant group.
- At locations where highest chemical concentrations are expected to occur in Delta and Richmond, RQ values greater than 1.0 (from 1.2 to 1.8) were identified for acute exposures to carbon monoxide, nitrogen dioxide and particulate matter (PM_{2.5} and PM₁₀) and for combined exposure to chemicals in the eye irritant and respiratory irritant groups.
- The highest chemical concentrations in the air occur within 5 to 15 m of the road edge near either entrance to the Tunnel.

Details on exposure limits and risk characterization for existing conditions, and a discussion of these conservative assumptions are provided in **Appendix B**.

Noise and Vibration

Overview

Noise measurements were collected in 2013 and 2014 at 41 noise-sensitive locations along Highway 99 between Westminster Highway and Highway 10 interchanges to characterize the existing noise environment. These locations are considered to be representative of areas where noise levels are expected to be highest and from which predictions about exposure and effects can be drawn. The predicted noise exposures were compared to guidelines (thresholds) developed by international organizations and relevant health effect indicators including: percent highly annoyed, sleep impairment (sleep disturbance and awakenings), speech interference and annoyance due to ground-borne vibration. Details on methods pertaining to exposure to noise and vibration are provided in **Appendix C**.

Human Health Considerations

Existing (2013) noise levels, within the LAA, range from approximately 45 dBA to 75 dBA, with existing noise levels dominated by Highway 99 traffic. The noise levels are greater than the health indicator guidelines adopted for the assessment at most of the noise-sensitive receptor locations evaluated. Therefore, current noise levels may be contributing to speech interference, sleep impairment, and high annoyance in some individuals at some receptor locations.

Current ground-borne vibration levels are dominated by road traffic along Highway 99. Except for receptors very close to the highway, existing ground-borne vibration levels are considered unlikely to cause annoyance within the LAA.

7.1.3 Potential Effects

This section provides a summary of anticipated changes to air quality related to the construction and operation of the Project. It also describes the methodology used to assess potential Project-related effects.

7.1.3.1 Assessment Methods

Quantitative assessments of human health risk were conducted to assess the potential for adverse health effects as a result of Project-related changes in air quality, and noise and vibration levels. The assessment involved comparison of estimates of air contaminant and noise exposure against health-based exposure limits. The potential for human health risks are evaluated based on the outcome of these comparisons.

The expected changes in air quality, noise, and vibration levels were estimated for Project construction and operation activities relative to estimated conditions without the Project.

For Project emissions to air, health effects were evaluated by comparing air quality projections for the year 2031 with the Project, to air quality projections without the Project, as well as existing air quality conditions (2011) as described in **Section 4.9 Air Quality**.

For Project-related noise, health effects were evaluated by comparing noise exposures in the year 2030 with the Project, as well as during Project construction, to the existing (2011) conditions, as described in **Section 4.10 Atmospheric Noise**.

The magnitude of exposure to Project-related changes in air emissions and noise is highly dependent on the proximity of humans to the various Project components. Residences, school and learning settings, medical/care facilities, places of worship, parks, and agricultural lands situated near the Project alignment were identified as potentially sensitive receptor sites for the characterization of exposure.

Air Quality

The assessment of human health risks related to air quality was supported by a HHRA that involved the determination of the potential for adverse health effects as a result of Project related emissions. The HHRA process provides for comparing predicted exposures to COPCs in air and in media affected by deposition of airborne chemicals (soil, plants, and livestock) to exposure limits. No adverse health effects are expected where predicted RQ values are at or below 1.0, indicating that predicted chemical exposure is at or below the chemical exposure limit. An RQ value greater than 1.0 signals the need for further review of COPC exposure to ensure the protection of human health.

The air quality HHRA is a predictive analysis that relies on assumptions to estimate receptor exposure and chemical toxicity. These assumptions were made such that potential health risks are not underestimated and are most likely overestimated. The HHRA assumes receptors are exposed to maximum modeled air concentrations plus relatively high measured (ambient) air concentrations. When combined, these outdoor air concentrations would only be expected to occur under worst-case conditions. Potential chemical toxicity was represented by the most stringent and defensible of the exposure limits available from regulatory agencies. The air quality HHRA further assumed that chemicals with similar health endpoints would interact in an additive manner, despite the lack of information to support these interactions.

The air quality HHRA was supported by comparing future predicted changes in air quality, with and without the Project, as presented in **Section 4.9 Air Quality**. Details on the HHRA of air quality are provided in **Appendix B**.

Noise and Vibration

Potential health effects were evaluated by comparing predicted noise levels with health-based guidelines for each indicator considered including %HA, sleep impairment (sleep disturbance and awakenings), speech interference, and annoyance associated with ground-borne vibration. The following guidelines values were adopted:

- For nighttime noise, an outdoor L_n of 45 dBA was adopted as a threshold for sleep disturbance and an outdoor L_n of 55 dBA was adopted as a threshold for sleep awakenings.
- For daytime noise, outdoor L_d should not exceed 50 dBA to maintain acceptable noise levels near schools and other learning centres and outdoor L_d should not exceed 55 dBA to maintain adequate speech comprehension in outdoor spaces.

- For day/night noise (L_{dn}), the maximum increase in %HA should not exceed 6.5%, taking into consideration noise source characteristics such as impulsiveness, tonality, and frequency.
- For ground-borne vibration, not exceeding a level of 100 VdB will prevent annoyance at sensitive receptor locations such as homes.

Where predicted noise and vibration levels, taking into account Project-related contributions to noise conditions, were above the guidelines, then adverse health effects were considered possible. In such instances, as noted in **Section 4.10 Atmospheric Noise**, mitigation is proposed to address Project-related increases in noise and associated changes in human health risk. In some cases, Project-related mitigation may address existing exceedances of such guidelines and in doing so provide a benefit with respect to human health. In such cases, reductions in human health effects were identified.

The noise HHRA was supported by comparing future predicted changes in noise, with and without the Project, as presented in **Section 4.10 Atmospheric Noise**. Details on the HHRA for noise and vibration are provided in **Appendix C**.

7.1.3.2 Project Interactions

An overview of potential interactions between Project activities and human health during the construction and operation of Project components is provided in **Appendix A**. A preliminary evaluation of the potential effects of Project interactions on human health, intended to focus the assessment on those interactions of greatest importance, is presented below. Interactions rated as having no effect are not considered further in the assessment.

Construction: The types of air emissions expected during construction (e.g. from diesel powered construction equipment) are different than those associated with the existing highway traffic.

Heavy equipment noise as well as ground vibration associated with compaction, densification, and pile driving (especially in the vicinity of the new bridge footings) are expected during Project construction. Construction-related noise, including decommissioning of the Tunnel, is more likely to vary over shorter time spans, being more impulsive and transient than traffic noise, which is typically dominated by continuous noise.

Operation: During operations, the Project involves potential changes in volume and composition of traffic along the Highway 99 corridor and allows for increased access to healthier transportation options (e.g., transit, walking and cycling). These bridge and highway improvements are expected to positively influence human health.

7.1.3.3 Potential Effects

Risk to Human Health from Exposure to Air Emissions

Project Construction

Potential health risks as a result of exposure to COPC in construction emissions are expected to be avoided through the implementation of best management practices for vehicle and equipment operation. Therefore, the health effect of construction-related emissions on air quality was not evaluated. For this reason, the potential health risks from Project-related air emissions during construction are not carried forward for assessment. However, mitigation measures typically employed to reduce potential construction impacts can be identified based on knowledge gained from experience on recent transportation projects, and are presented in **Section 7.1.4**.

Project Operation (2031)

The air quality HHRA considered inhalation exposure to COPCs in air for agricultural, residential, and recreational receptors, as well as oral/dermal exposure to COPCs in soil, plants, and livestock for agricultural receptors. Air quality with the Project was defined by air concentrations determined from air dispersion modeling of Project emissions in 2031 (described in **Section 4.9 Air Quality**) plus ambient air concentrations measured in the Lower Fraser Valley in 2010.

The acute and chronic inhalation RQ values determined for agricultural, residential and recreational receptors were below 1. Acute inhalation RQ values at or below 1 were estimated at locations of maximum concentrations (i.e., immediately adjacent the roadway) for Richmond and Delta. All of the chronic oral/dermal RQ values were below 1 for agricultural receptors exposed to non-volatile chemicals in soil, plants and livestock, as a result of airborne deposition.

RQ values predicted for future conditions with and without the Project are generally below 1, and therefore no adverse health effects are identified as a result of changes to air quality from Project emissions in the LAA. The RQ values determined for the future (2031) with the Project were the lowest of all of the scenarios evaluated (i.e., compared to the future without the Project (2031) or existing (2011) conditions, indicating an overall improvement in air quality as a result of the Project. For these reasons, potential effects to human health from emissions during Project operation are not carried forward for assessment.

Details on the RQ values for individual contaminants under existing, and projected future conditions with and without the Project are provided in **Section 4.0** of **Appendix B**.

Risk to Human Health from Change to Noise or Vibration Levels

Project Construction

Noise predictions for the construction phase, as discussed in detail in **Section 4.10 Atmospheric Noise**, were based on the draft design concept and preliminary assumptions about the location and duration of noise/vibration generating activities such as pile driving. An overview of Project-related effects during construction, without mitigation, in terms of %HA, and potential for sleep disturbance and interference with speech comprehension, is provided below. Detailed results of noise-related human health risk characterization are provided in **Appendix C**.

There will be increased noise and vibration levels associated with construction activities compared with existing conditions. The noise thresholds for % HA, sleep impairment (disturbance and awakenings) and speech comprehension are likely to be exceeded at the majority of the receptor locations considered. Also, the change in predicted noise level due to construction activities will be of sufficient magnitude that they will be perceived at several sensitive receptor locations. Similarly, ground-borne vibration levels due to pile driving and compaction activities are predicted to exceed the annoyance guideline at several sensitive receptor locations. These effects will be temporary during these specific activities but will last for the duration of construction.

Project Operation (2031)

Future operation of the Project without mitigation is predicted to increase noises levels by one to four dBA at most receptor locations. Since the health indicator guidelines are already exceeded at most receptor locations, any further increase in noise levels may increase the likelihood and/or severity of effects. Any such effects are expected to be greater in areas where noise level increases are perceptible (>3 dBA) because individuals are less likely to adapt to increased noise levels, if they are perceived. The results indicate that the predicted increase in average sound level resulting from Project operation is unlikely to be perceptible by the majority of residents.

As vibration effects associated with existing traffic levels are below annoyance thresholds, increases in ground-borne vibration from levels currently experienced along Highway 99 are not expected, even with forecasted growth in traffic, as the maximum permitted truck size and speed limits are not expected to change.

Without mitigation, the following potential Project-related health effects during the operational phase for each health indicator evaluated is provided below. Further detail on potential effects of Project-related changes in noise levels is provided in **Appendix C**.

Percent highly annoyed

The predicted change in %HA during Project operation compared with existing conditions, without mitigation, is higher than the threshold of 6.5% at 5 of 31 noise-sensitive receptor sites.

Potential for Sleep Disturbance

The modelled nighttime sound level (L_n), without mitigation, is predicted to exceed the sleep disturbance threshold of 45 dBA outdoors at all but one of 29 receptor sites (97%). In comparison, the L_n under existing noise levels exceeds the sleep disturbance guideline at 19 of 21 receptor sites (90%). Overall, the increase in L_n as a result of Project operation is anticipated to be minimal (generally less than 3 dBA).

Potential for Interference with Speech

Without mitigation, the modelled daytime sound level (L_d) (or L_{dn} values for sites where no L_d values were developed) is predicted to exceed the speech comprehension guideline of 55 dBA outdoors at 34 of 38 receptor locations (89%). In comparison, the L_d under existing conditions exceeds the speech comprehension guideline at 83% of the receptor locations. The overall increase in L_d as a result of Project operation in comparison with existing conditions is anticipated to be minimal (generally less than 5 dBA).

Vibration

Project operation is not anticipated to result in a substantial change in ground-borne vibration levels experienced by sensitive human receptors.

7.1.4 Mitigation Measures

Measures that will be incorporated into Project design or implemented during construction to avoid or reduce potential effects of Project-related changes in air quality and noise on human health, and expected outcomes of implementation of those measures are outlined in the sections below.

7.1.4.1 Air Quality

A suite of best management practices and mitigation measures will be outlined in an Air Quality and Dust Control Management Plan, a component of the Construction Environmental Management Plan (CEMP) as described in **Section 12.0 Management Plans** to ensure that potential air quality and human health issues related to Project construction are addressed.

Mitigation measures in the Air Quality and Dust Control Management Plan may include:

- Procedures for the application of dust suppressants to construction areas and stockpiles to control fugitive dust and other airborne emissions.
- Routine maintenance of vessels and vehicles.
- Implementation of engine idling restrictions and selection of quieter vessels and vehicles when possible.
- Managing speeds of construction-related vehicles.

The Ministry has extensive experience in developing and implementing effective measures to address issues related to air quality during construction of large transportation infrastructure projects in urban areas in the Lower Mainland. Therefore, with the implementation of best practices and mitigation measures specified in the CEMP, no human health issues related to air quality are expected during Project construction.

7.1.4.2 Noise and Vibration

Mitigation during Project Construction

Mitigation measures that will be implemented to minimize community impacts due to temporary, unavoidable construction-related noise are identified in **Section 4.10.6 Atmospheric Noise Mitigation Measures**. These measures include equipment and activity restrictions and scheduling, noise monitoring, and community engagement and communication.

Since the atmospheric noise predictions (**Section 4.10 Atmospheric Noise**) explicitly identify areas where noise exposures may be greatest, this facilitates the consideration of site specific mitigation. A key mitigation for construction noise and vibration, therefore, will be the inclusion of measures to minimize the influence of noise and vibration at sensitive receptor locations, and includes consideration of mitigation such as installation of noise barriers at appropriate locations and schedule limitations on when specific construction activities can occur.

A key component of this mitigation, especially to minimize increases in stress and annoyance, is strong communication and dialogue with potentially affected parties so that they have a clear understanding of the expected degree of disturbance associated with noise/vibration during the construction phase. The Ministry will continue to identify potentially affected parties that frequent relevant sensitive receptor locations and engage with them as the details of Project construction evolve.

Implementation of mitigation measures, including appropriate scheduling of construction activities and community engagement and communication, are expected to minimize potential human health effects associated with noise during Project construction.

Mitigation during Project Operation

During Project operation, noise may be mitigated through application of the Ministry's 2014 Noise Policy. Specific mitigation will include noise avoidance and mitigation measures such as noise barriers and noise control at the receptor or other measures. Noise sensitive sites where mitigation consideration is warranted are summarized in **Section 4.10.6 Atmospheric Noise Mitigation Measures**.

With mitigation, the Project is anticipated to reduce noise levels (relative to without mitigation), below current (2013) levels at most receptor locations. This will not only reduce the number of individuals exposed to noise levels above the health indicator guidelines, but will further reduce the likelihood/severity of effects compared with current noise levels. A summary of the changes in for each health indicator is provided below. Further detail on Project-related changes in noise levels and human health is provided in **Appendix C**.

Percent highly annoyed

The %HA under the future with mitigation scenario will be reduced, compared with current (2013) conditions, except at four receptor locations. The predicted decrease in %HA with mitigation (relative to without mitigation) varies from approximately 2 to 20 %HA, with most residential receptors predicted to experience reductions of 10 to 20 %HA. Of the four receptors that are predicted to have an increased %HA, the increases are predicted to be less than the 6.5% guideline. Overall, there will be a significant reduction in the number of people who are highly annoyed compared with existing conditions. This represents an important net benefit for the Project.

Potential for Sleep Disturbance

The sleep disturbance threshold of L_n 45 dBA and sleep awakening threshold of L_n 55 dBA is estimated to be exceeded currently at most receptor locations. With mitigation, L_n noise levels are predicted to be reduced below existing levels depending upon the type of mitigation and receptor location. This will not only lead to an overall improvement to the nighttime noise environment but it will also reduce L_n noise levels below the sleep awakening threshold at a number of residences. This represents a net benefit for the Project.

Potential for Interference with Speech

Two outdoor receptor locations (places of worship) are predicted to currently exceed the outdoor speech comprehension threshold of L_d 55 dBA. Additionally, one school is predicted to have L_d levels higher than the 50 dBA threshold. However, mitigation is predicted to reduce outdoor daytime (L_d) sound levels, depending upon the type of mitigation and receptor location, compared with existing noise levels. This will reduce the level of speech interference at all receptor locations to levels below existing conditions. This represents a net benefit for the Project.

Vibration

Existing vibration effects associated with current traffic levels are below the annoyance thresholds and are not expected to increase even with forecasted growth in traffic in the corridor.

7.1.5 Residual Effects and their Significance

Increased levels of air pollutants and noise levels can affect human health if predicted levels are higher than the thresholds adopted for the protection of human health.

As discussed in **Section 4.9 Air Quality**, construction-related air emissions can be effectively mitigated with the application of effective best management practices that will be in place during construction. As a component to the CEMP, an Air Quality and Dust Control Management Plan will be developed, which will describe measures to control and minimize fugitive dust and other airborne emissions associated with construction equipment, demolition, and other decommissioning activities, and soil handling. In the future, operation of the proposed Project will result in an improvement in air quality relative to existing conditions and future conditions without the Project. On this basis, no Project-related residual effects on human health, associated with air contaminants, are predicted.

As discussed in **Section 4.10 Atmospheric Noise**, construction-related increases in noise levels will be addressed through the use of best practices including scheduling of specific noise intensive activities. While future noise levels are predicted to exceed health effect indicator thresholds at some receptors, this will be at receptors where such exceedances occur today and the Project is anticipated to reduce noise levels below current (2013) levels at most receptor locations. This will improve the overall sound environment and reduce any health effects to below current levels. This is considered a net benefit and no residual effects to human health are predicted.

7.1.6 Cumulative Effects and their Significance

As discussed in **Section 7.1.5**, the Project is not predicted to have residual effects on human health. Therefore, a cumulative effects assessment was not undertaken.

7.1.7 Follow-up Strategy

As no residual or cumulative effects are predicted for human health, no follow-up strategy is proposed.

7.2 Health Impact Assessment

In recent years there has been increased interest, among the public, governments, and health authorities, in the use of health impact assessments (HIAs) for assessing health considerations associated with various development projects. In general terms, an HIA is used as a planning tool and provides a framework for considering the way in which the planning and development of community infrastructure may influence health in either positive or adverse ways.

Building on this interest, Metro Vancouver has published a guidebook and toolkit for conducting HIAs of transportation and land use activities (Metro Vancouver 2015a,b). Recognizing this emerging trend, and in response to input from regional health authorities (i.e. Vancouver Coastal Health and Fraser Health) during pre-application consultation, the Ministry initiated an HIA to support the ongoing planning and development of the Project.

The following section includes:

- A description of how the HIA undertaken supports the Project planning
- Background on the HIA process including specific HIA planning tools developed by Metro Vancouver
- An overview of the methodology used to support the HIA for the Project
- A summary of the key findings of the HIA for the Project

The full HIA for the Project can be found www.masseytunnel.ca

7.2.1 Integration of HIA into Application and Project planning

The issues assessed in the HIA are subject to a different methodology than that applied to issues assessed in the Application as intermediate or valued components. Nonetheless, the analysis of health issues provided for in the HIA has supported the environmental assessment of the Project presented in the Application in a number of ways including:

- Identifying a broader range of Project-related health considerations for potential inclusion in the environmental assessment and confirming the scope of health-related intermediate and valued components assessed in the Application.
- Providing a framework, that complements the environmental assessment process, for considering health issues that may not be captured in the assessment of intermediate and valued components presented in the Application.
- Providing useful information to support future stages of Project planning by highlighting Project-related opportunities to enhance health benefits during future stages of Project design and construction.

7.2.2 HIA Background

The conceptual framework behind HIA is based on the idea that individual and community health is shaped by wider social, economic, and environmental influences and factors beyond health services and biological such as age. These factors, referred to as health determinants, influence health outcomes (i.e., rates of injury and disease) and include:

- Physical environment factors (e.g., air quality, water quality)
- Built environment factors (e.g., buildings, public spaces, roads, bike lanes)
- Livelihood factors (e.g., income, employment)
- Social and community factors (e.g., social support, family structure, access to services)
- Lifestyle factors (e.g., diet, exercise, alcohol and tobacco use)

The application of the HIA framework is supported by the established understanding of the relationship between determinants of human health noted above and health outcomes. The understanding of the relationship between determinants of health and health outcomes is supported by epidemiological studies that link changes in determinants of health to specific health outcomes.

Applying the HIA framework in the context of a specific project provides for a consideration of how the development and operation of the project can influence human health through a variety of mechanisms.

The Process Diagram included in Metro Vancouver’s HIA guidebook **Figure 7.2-1**, illustrates the conceptual framework behind HIA and how land use planning activities and the development of community infrastructure influences broader determinants of health.

Figure 7.2-1 Activity Impacts, Health Determinates, and Health-Related Outcomes (Metro Vancouver 2015a)

7.2.3 Project HIA Methodology

Considering previous planning and consultation work that had been done to support Project development, and the work done in support of the environmental assessment (Application) for the Project, it was determined that a desktop HIA would be an appropriate level of assessment. The Project's HIA followed the standard process for health impact assessment outlined in multiple reference documents: screening; scoping; assessment and analysis; development of recommendations; reporting; and monitoring and evaluation.

This HIA drew on the reported results of stakeholder engagement activities that have been undertaken about the Project over the last three years with Aboriginal Groups, the general public, and municipal, professional and community-based organizations. In addition, the scope of the HIA was directly reviewed by the Vancouver Coastal Health and the Fraser Health Authorities. Aboriginal Groups and federal, provincial and local governments associated with the Technical Working Group supporting the environmental assessment of the Project were provided an opportunity to provide feedback on the HIA process for the Project. Additional engagement with emergency responders was also undertaken to support HIA development. Comments from all of these reviewers informed the HIA approach.

Eleven health interest areas emerged from the scoping process; these are shown in **Table 7.2-1**.

Table 7.2-1 Health interest areas scoped for the HIA

| Health Issue | Potential changes during Construction | Potential changes during operations | Health outcomes (positive or adverse) that could be affected |
|--------------------------------------|--|---|---|
| Physical Environment | | | |
| 1. Exposure to Airborne Contaminants | <ul style="list-style-type: none"> • Cardiorespiratory effects, from dust and emissions due to construction and equipment | <ul style="list-style-type: none"> • Changes to health outcomes related to reduced emissions from reduced congestion-related idling • Changes in regional air quality due to traffic pattern changes | <ul style="list-style-type: none"> • Cardiorespiratory health outcomes. • Additional health outcomes associated with airborne contaminants. |
| 2. Noise | <ul style="list-style-type: none"> • Construction-related noise | <ul style="list-style-type: none"> • Road traffic noise | <ul style="list-style-type: none"> • Annoyance, sleep disturbance, speech comprehension. |
| 3. Food and Water Consumption | <ul style="list-style-type: none"> • Contamination of food sources via construction activities | <ul style="list-style-type: none"> • Changes to food (fish, agriculture) quality or acceptability • Exposure to contaminants via food/water sources • Changes to agricultural land production capability | <ul style="list-style-type: none"> • Health considerations associated with changes in air quality/water quality. |
| 4. GHG Emissions | <ul style="list-style-type: none"> • N/A | <ul style="list-style-type: none"> • Changes to emissions from a reduction in congestion-related idling • Changes to emissions from increases in traffic volumes or vehicle kilometers travelled | <ul style="list-style-type: none"> • Climate change-considerations associated with construction and operation of the Project. |

| Health Issue | Potential changes during Construction | Potential changes during operations | Health outcomes (positive or adverse) that could be affected |
|-------------------------------------|--|---|---|
| Built Environment | | | |
| 5. Active and Public Transportation | <ul style="list-style-type: none"> • Temporary blockage of some routes leading to decreased walking/cycling • Effects on access to public transportation | <ul style="list-style-type: none"> • Change in walking and cycling conditions • Changes on access to public transportation | <ul style="list-style-type: none"> • Physical activity, weight, metabolic outcomes, stress and equity. |
| 6. Traffic Safety | <ul style="list-style-type: none"> • Traffic diversions and speed changes | <ul style="list-style-type: none"> • Change in traffic safety Change in pedestrian and cyclist injuries due to increased walking/cycling | <ul style="list-style-type: none"> • Injury and fatality as well as stress and mental well-being. |
| Social and Community Factors | | | |
| 7. Connectivity and Access | <ul style="list-style-type: none"> • Social connectivity and community cohesion | <ul style="list-style-type: none"> • Changes in travel time • Changes in social connectivity and community cohesion • Changes in accessibility to services for low-access groups | <ul style="list-style-type: none"> • Stress and mental well-being as well as care and management of health conditions. |
| 8. Emergency Response | <ul style="list-style-type: none"> • Emergency response times | <ul style="list-style-type: none"> • Changes in emergency response access | <ul style="list-style-type: none"> • Health outcomes related to timely medical treatment. |
| 9. Safety and Security | <ul style="list-style-type: none"> • N/A | <ul style="list-style-type: none"> • Suicide risk • High-risk populations congregating near Bridge • Seismic stability compared with current Tunnel | <ul style="list-style-type: none"> • Injury and mental well-being |

| Health Issue | Potential changes during Construction | Potential changes during operations | Health outcomes (positive or adverse) that could be affected |
|-----------------------------|---|---|--|
| Livelihood Factors | | | |
| 10. Economic Health Effects | <ul style="list-style-type: none"> • Construction-related employment and contracts • Temporary impacts on access to local businesses • Limitations on movements of goods or services | <ul style="list-style-type: none"> • Project related economic benefits • Changes in access to employment opportunities • Changes in access to affordable housing • Health care benefits associated with reduced potential for chronic disease or injury | <ul style="list-style-type: none"> • Multiple aspects of physical and mental well-being. |
| Lifestyle Factors | | | |
| 11. Recreation and Parks | <ul style="list-style-type: none"> • Temporary impacts to parks experience | <ul style="list-style-type: none"> • Changes in connectivity to park and recreation areas • Changes to park experience | <ul style="list-style-type: none"> • Physical activity, weight, stress and mental well-being. |

The geographic boundaries for the HIA for the Project were developed on an issue-by-issue basis in order to most appropriately capture the different effects of topics ranging from air quality to recreation and parks. The temporal boundary for construction was defined as the years 2017 to 2022; and for operations, the years 2022 to 2031.

In addition to assessing the effects of the Project on the general population for each of these 11 health interest areas, the HIA also paid specific consideration to how effects might be experienced by vulnerable populations (i.e., those more likely to suffer adverse health effects) and by Aboriginal populations.

7.2.4 Existing Conditions

The City of Richmond (Richmond) is a multi-ethnic urban centre with a population of approximately 213,000. Richmond residents report incomes that are lower than the Canadian average – and 38% of its population earns less than \$40,000 annually. Overall, the municipality relies more heavily than others in the area on cars for daily commuting, rather than biking, walking, or public transit (My Health My Community 2014). While Richmond residents consider themselves to be less healthy than residents of Metro Vancouver overall, Richmond also has the highest life expectancy in all of Canada.

Delta is a population of around 100,000 people, with an average household income 30% higher than the Canadian average. Although it has a strong farming and agricultural background, the municipality is currently one of the fastest growing industrial areas in the Metro Vancouver region. In Delta, residents were more likely to rate their general health as excellent or very good in comparison to the region. However, health outcomes actually show that Delta residents have slightly higher reported rates of chronic conditions than Metro Vancouver as a whole.

Within all areas of Metro Vancouver, vulnerable populations are at elevated risk of experiencing adverse health effects. These potentially vulnerable populations include children and the elderly, those with pre-existing health conditions, and those at the lower end of the socio-economic spectrum.

In addition, Aboriginal Groups in the region comprise a distinct group that may experience health effects differently than the population at large. Project planning has involved consultation and engagement with 13 Aboriginal Groups, as noted in **Section 10.0 Aboriginal Consultation**, with potential interests in the Project.

7.2.5 Key findings

7.2.5.1 Exposure to Airborne Contaminants

The potential for health effects stemming from exposure to airborne contaminants is reviewed in **Section 7.1**. Although this issue is addressed thoroughly in the HHRA presented in **Section 7.1**, the HIA also provides for a consideration of health effects related to changes in air quality.

The HIA supports the following conclusions with respect to exposure to airborne contaminants:

- Air quality will improve in the future across the Local Assessment Area, both with and without the Project. However, improvements are greater with the Project.
- The predicted human exposure to air contaminants will be far below the thresholds that have been set for specific substances; therefore, no adverse effects are predicted.
- Vulnerable populations, including children, the elderly, and those with chronic respiratory problems, will derive the most benefit.
- During the Construction phase, there is the potential for Project-related equipment to temporarily generate diesel emissions. The Project will implement best management practices for vehicle and equipment operation to minimize exposure to these emissions.

7.2.5.2 Noise

The potential for health effects stemming from exposure to noise is reviewed in **Section 7.1**. Although this issue is addressed thoroughly in the HHRA presented in **Section 7.1**, the HIA also provides for a consideration of health effects related to changes in noise.

The HIA supports the following conclusions with respect to exposure to noise:

- During the construction phase, there will be temporary noise generated during site preparation and construction activities. A limited number of locations in Richmond and Delta may temporarily experience perceptible increases in daytime noise.
- During operations, vehicles will remain the primary source of noise. Planned mitigation for Project operations include the potential application of a combination of measures, as appropriate for specific sites, as discussed in **Section 4.10 Atmospheric Noise**.
- As a result of the application of such measures, traffic-related noise during Project operation is not expected to have an impact on human health.

7.2.5.3 Food and Water Consumption

Healthy diets help prevent disease and promote better health. For Aboriginal Groups, subsistence food sources are important for maintaining a healthy diet, and have been linked with lower rates of conditions such as obesity, diabetes, heart disease and stroke as well as supporting other aspects of culture and community (Authority 2012). Similarly, access to a safe, steady water supply is essential to support health and prevent disease.

The South Arm and the mouth of the Fraser River are important locations for subsistence and commercial fishing. Field sampling suggests that fish currently live in clean habitat, making them safe for consumption (**Section 4.2 Sediment and Water Quality**). In addition to recreational and sport users, there are several Aboriginal Groups who fish, in the area between the Port Mann Bridge and the mouth of the Fraser River, for food, ceremonial and social purposes. Aboriginal Groups have indicated that fishing is an important factor for wellness and that access to traditional foods is important for maintaining a nutritious diet, as such foods tend to be more nutrient-dense than market foods, leading to better overall health. **Section 10.1.3 Aboriginal Interests Assessment** provides information regarding the assessment of potential Project-related effects on the availability and quality of resources for the exercise of Aboriginal Interests.

The HIA supports the following conclusions with respect to food and water consumption:

- As noted in **Section 5.4 Agricultural Use**, agricultural production will not be adversely affected by the Project. As well, as noted in **Section 4.9 Air Quality**, Project-related decreases in air contaminants will help to reduce the risk of exposure to contaminants, via consumption of locally grown food, in the future.
- The Project is not expected to affect the quality or availability of fish for consumption, as protecting fish and fish habitat has been incorporated within the Project design and construction planning (**Section 4.4 Fish and Fish Habitat**).
- In the event of a spill, it is plausible that concerns could result regarding exposure to contamination and lead to avoidance among people who rely on fishing for food including Aboriginal Groups.
- The perception that Project could result in changes to the quality of fish or other marine resources can be addressed through communicating the results of Project-related environmental monitoring programs as discussed in **Section 12.0 Management Plans** of the Application, including those required to address accidents or malfunctions that may occur. This will be particularly relevant for Aboriginal Groups who rely more heavily than other populations on access to fish as an important component of their diet.
- Drinking water availability will remain secure during all stages of the Project. Construction of the bridge and decommissioning of the Tunnel are not expected to affect the Lulu Island-Delta water main, and careful monitoring and mitigation as discussed in **Section 4.1 River Hydraulics and River Morphology** will be implemented.

7.2.5.4 Greenhouse Gas (GHG) Emissions

Potential Project-related changes in air quality, are assessed in **Section 4.9 Air Quality**. The HIA builds on the results of the air quality assessment for the Project by considering potential health impacts associated with changes in GHGs.

GHG emissions such as carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O) are drivers of climate change (Environment Canada 2013). Climate change has the potential to adversely impact health through risks posed by high temperatures, extreme weather events, and changes in patterns of infection (World Health Organization 2015). Climate change can also affect the social and environmental determinants of health: clean air, safe drinking water, sufficient food and secure shelter (World Health Organization 2015). These effects are primarily experienced at a regional or global level, rather than being localized close to GHG emissions sources.

The HIA supports the following conclusions with respect to GHG emissions:

- Reducing current congestion at the Tunnel will result in reductions in GHGs that occur as a result of congestion-related idling.
- GHG emissions may further decrease during operation of the bridge if traffic volume is reduced by the uptake of active or public forms of transportation.

7.2.5.5 Active and Public Transportation

Potential Project-related changes in traffic, including a consideration of different modes of transportation such as transit, cycling and walking, are assessed in **Section 5.1 Traffic**. The HIA builds on the results of the assessment of traffic by considering potential health impacts associated with changes in access to different modes of transportation.

Both active transportation (walking and cycling) and public transportation are associated with a wide range of health benefits, such as cardiovascular fitness, mental health and reductions in obesity and chronic disease; and reductions in traffic collisions and contaminant emissions (Litman 2010, Reynolds, Winters et al. 2010).

The HIA supports the following conclusions with respect to active and public transportation:

- As concluded in **Section 5.1 Traffic**, the Project will improve both active and public transportation options once in operation and public transportation will become more efficient and accessible.
- Construction phase effects on traffic can be mitigated to prevent access and safety problems for active and public transportation.

- As noted in **Section 5.1 Traffic**, the current bike shuttle service will remain open during the construction phase.
- The addition of multi-use pathways across the new bridge and interchanges will improve options for active transportation locally and regionally and will also improve safety for users.
- Increased options for safe active and public transportation may contribute to improved health equity. Improvements to public transit can also have beneficial effects for disadvantaged or vulnerable populations.
- Monitoring of the use of the multi-use paths will be undertaken to confirm Project objectives have been met and make further operational refinements if required.
- Better public transit has been associated with increased access to medical services and healthy foods, and as a result could have positive impacts on health equity.
- Future Project consultation, as discussed in **Section 11.0 Public Consultation** and **Section 10.0 Aboriginal Consultation** will provide opportunities for local governments and other key stakeholders to provide input on the final design of multi-use paths that are part of the Project.
- As discussed in **Section 5.1 Traffic**, the Ministry will work with TransLink and local governments to ensure that current levels of active transportation and transit service is maintained through the construction period.

7.2.5.6 Traffic Safety

Potential Project-related changes in traffic, including a consideration of how the Project will address existing (traffic) safety risks, are assessed in **Section 5.1 Traffic**. The HIA builds on the results of the assessment of traffic by considering potential health impacts associated with addressing existing safety risks.

Currently, the Tunnel and the interchanges at Steveston Highway and Highway 17A have substantial safety issues. Over the five-year period of 2008-2012, 6,024 collisions occurred on Highway 99 within the Project corridor and some adjacent intersections and routes south of the Oak Street Bridge. Of these collisions, approximately 37% resulted in injury or fatality (Delcan 2015). In the span of the Tunnel itself, almost half (49%) reported collisions between 2008 and 2012 resulted in injury or fatality.

The HIA supports the following conclusions with respect to traffic safety:

- As noted in **Section 5.1 Traffic**, the Project is expected to result in a decrease in traffic accidents and associated injuries and fatalities.
- The new bridge includes several features that will reduce the high collision rates at the Tunnel including elimination of the need for the current counter-flow system and additional lane capacity that allows for safer merging movements and separation of slower moving traffic.
- Monitoring of collision incidence on the improved Highway 99 will be undertaken to confirm project objectives have been met and guide operational refinements if required.
- Planned improvements for interchanges will also result in safer merging lanes and modern standards.
- Future Project consultation, as discussed in **Section 11.0 Public Consultation**, will provide opportunities for the Ministry to work with police on planning for monitoring and enforcement of speed limits.

7.2.5.7 Accidents and Malfunctions

The effects of potential Project-related accidents and malfunctions are assessed in **Section 8.0 Accidents and Malfunctions** of the Application. The HIA builds on the results of this assessment by considering potential health impacts associated with potential accidents and malfunctions.

The HIA supports the following conclusions with respect to accidents and malfunctions:

- During construction, there is a very low possibility of an accident or malfunction that results in a release of toxic, hazardous or otherwise harmful materials into the water as discussed in **Section 8.0 Accidents and Malfunctions**. Mitigation measures recommended for addressing potential spills are provided in **Section 12.0 Management Plans**.
- In the event of a spill, it is plausible that concerns could result regarding exposure to contamination and lead to avoidance among people who rely on fishing for food including Aboriginal Groups.
- Communicating the results of Project-related environmental monitoring programs presented in **Section 12.0 Management Plans**, including those required to address accident or malfunctions that may occur, will help to inform communities about exposure risk and allow continued access to food resources such as fish.

7.2.5.8 Connectivity and Access

Socially connected communities foster social participation and strong relationships, leading to physical and social well-being, while a lack of connection can increase social disorder, conflict and inequality (Forrest 2001). Connectivity and access are also important with respect to accessing vital services, such as health care and employment opportunities.

The HIA supports the following conclusions with respect to connectivity and access and draws on information presented in **Section 1.1 Description of Proposed Project** and **Section 5.1 Traffic** of the Application:

- As noted in **Section 1.1.10 Project Benefits**, the overall impacts of the Project on connectivity and access will be positive.
- Reduced congestion in the Highway 99 corridor, as discussed in **Section 5.1 Traffic**, will improve travel times and reliability for those accessing services, school, work or other locations.
- As noted in **Section 5.1 Traffic**, the Project will support reductions in transit times for those using public transit or carpooling, making these options more attractive to commuters. This will improve equity in access to travel for disadvantaged populations.
- The Project will improve access for pedestrians and cyclists, which will lead to increases in physical activity levels.
- As discussed in **Section 1.1.10 Project Benefits**, by being designed to accommodate future forecasted growth in population and employment in communities south of the Fraser River, the Project will improve connectivity between Richmond and Delta as well as within these municipalities.
- The Project will also support improved connectivity for local farm operations.

7.2.5.9 Emergency Response

Emergency response services, including ground and air ambulance services, police services and firefighters, are all a part of responding to emergencies and provide critical medical care to individuals experiencing acute health crises.

Accidents in or near the Tunnel occur frequently and often involve simultaneous response from multiple jurisdictions. Emergency responders, including fire, ambulance and police services, have cited challenges in accessing these accidents due to congestion, a lack of shoulders and pull-outs, and a lack of cameras in the Tunnel to identify where the collision is situated. These challenges can have health implications for those travelling to seek urgent medical attention.

The HIA supports the following conclusions with respect to emergency response:

- The Project will have a positive effect on emergency response.
- The new bridge will be designed to a lifeline standard to be kept open for emergency vehicle response and post-earthquake economic recovery following a major seismic event.
- As discussed in **Section 5.1 Traffic**, the design of the Bridge will increase traffic safety by addressing congestion, improving interchanges and eliminating the need for the counter-flow which will reduce the number of events for which emergency response is needed.
- As discussed in **Section 11.0 Public Consultation** and **Section 10.0 Aboriginal Consultation**, future stages of consultation will provide opportunities for first responders, emergency response agencies and other interests to provide input on emergency response considerations during future design stages.
- The bridge is anticipated to substantially improve emergency response capabilities for local accidents. These improvements will stem from the increase in numbers of lanes; reduced traffic congestion; dedicated transit/HOV lanes; and improved safety conditions for emergency responders.
- Based on the current available evidence, improved emergency response times will likely improve health outcomes for individuals experiencing acute conditions that require urgent medical attention (Craig 2014).

7.2.5.10 Safety and Security

Within the HIA, safety and security are considered in terms of violence – either violent crime or self-inflicted violence (suicide). Both violent crime and self-inflicted violence have the potential to result in injury or death, a clear link to health. In addition, fear of violent crime has been found to adversely impact mental well-being and physical health, both directly and indirectly (Guite, Clark et al. 2006).

The HIA supports the following conclusions with respect to safety and security:

- The installation of safety fencing, as described in **Section 1.1 Project Description**, will help to reduce the incidence of suicide (Beautrais 2007, Reisch T 2007, Sinyor 2010).
- Emergency responders report that isolated areas, such as the bases of bridges, can attract high-risk populations to create temporary shelters that may be associated with elevated rates of petty crime.
- As noted, **Section 1.1, Project Description**, the Project will include lighting for the multi-use trails and applicable areas to meet functional, safety and Crime Prevention Through Environmental Design (CPTED) requirements.

- The new bridge will have a far greater ability to withstand a seismic event than the Tunnel. This greatly reduces the chance of injury and mortality from a failure compared with the Tunnel, and will improve safety into the future.
- Future engagement, as discussed in **Section 11.0 Public Consultation** and **Section 10.0 Aboriginal Consultation**, will provide opportunities to work with local governments and other key stakeholders and ensuring safety and security considerations are addressed in the design of the Project.

7.2.5.11 Economic Health Effects

Employment, income and its distribution are key determinants of health. Employed individuals and those in higher income brackets typically experience better health outcomes with respect to life expectancy, mortality, cardiovascular disease, mental health and child health status. As discussed in **Section 1.1.10 Project Benefits**, and summarized below, the impacts of the Project on economic considerations, including employment, are expected to be positive.

The HIA supports the following conclusions with respect to economic health effects:

- Overall, the Project is anticipated to have a positive effect on health in Metro Vancouver, due to positive economic contributions and effects to the local and regional economy.
- The operation of the Project will contribute to improved goods movement in the region, as well as the viability of local businesses. This will help support local economic growth and job opportunities, both of which can contribute to positive health and well-being.
- The Project will cause minor and temporary constraints to marine traffic and commercial truck traffic during construction, but these will have a negligible effect on the local and regional economies.
- Future Project consultation, as discussed in **Section 11.0 Public Consultation** and **Section 10.0 Aboriginal Consultation**, will provide for working with adjacent land owners and businesses to avoid impacts to business operations.
- Overall there will be a net gain of agricultural land that can be actively farmed as well as access improvements for local agricultural operations.
- As noted in the **Section 10.0 Aboriginal Consultation** the Ministry is currently engaged with Aboriginal Groups with respect to employment, training, and business opportunities during Project delivery.

7.2.5.12 Recreation and Parks

The consideration of recreation and parks undertaken in the HIA is informed by **Section 5.3 Land Use** which considers potential effects on parks from a land use perspective and identifies mitigation to address potential effects on land use. The assessment of land use presented in **Section 5.3** also includes a specific focus on recreational use of Deas Island Regional Park.

Access to and engagement with natural features and the environment offers numerous health benefits. Experiencing nature is associated with lower levels of stress, anxiety, depression, and chronic disease; and increased levels of concentration and cognitive functioning (Provincial Health Services Authority 2014). Parks are also associated with multiple physical, psychological and social benefits (Bedimo-Rung 2005). Parks promote physical activity, which has well-established links with positive physical and mental health outcomes. Park users may also experience psychological benefits with respect to improvements in mood, stress and anxiety. Lastly, using parks may encourage social interaction, promoting community cohesion and social capital (Bedimo-Rung 2005).

Residents of Metro Vancouver highly value outdoor recreation, and are among the most active of British Columbians. According to the 2011 *Regional Outdoor Recreation Opportunities Study* commissioned by Metro Vancouver and the Fraser Valley Regional District (FVRD), residents of Metro Vancouver used parks and open spaces year-round, with an average of 41 visits per person/year (LEES+Associates, Mustel Group et al. 2011).

The HIA supports the following conclusions with respect to recreation and parks:

- Construction activities may deter some park users from using nearby parks (such as Deas Island) as a result of construction related noise and traffic management.
- During operations, park usage may increase as existing traffic congestion is addressed and access is improved.
- As noted in **Section 5.3 Land Use**, the park experience at Deas Island Regional Park will change as a result of the Project and will include both benefits (i.e., improved air quality, restoration of shoreline, improved park connectivity, revegetation of areas under the bridge, decreased noise at Tunnel portal) as well as adverse effects (i.e., shading, overhead noise, visual conditions).
- The extent to which the overall change to the recreational experience at Deas Island Regional Park is beneficial or adverse is subjective and will be perceived differently by different users.

Attachment B Predicted Air Concentrations and Risk Quotient Values – All Receptor Locations

Abbreviations and Acronyms

| Term | Definition |
|------------------------------------|---|
| $\mu\text{g}/\text{kg}/\text{day}$ | microgram per kilogram body weight per day |
| $\mu\text{g}/\text{m}^3$ | microgram per cubic metre |
| COPC | chemicals of potential concern |
| COPD | chronic obstructive pulmonary disease |
| DPM | diesel particulate matter |
| Hg | mercury |
| K_{ow} | octanol-water partition coefficient |
| MOVES | U.S. EPA Motor Vehicle Emissions Simulator |
| MPOI | maximum point of impingement |
| NH_3 | ammonia |
| NO_2 | nitrogen dioxide |
| NOAEL | no observable adverse effect level |
| OEHHA | Office of Environmental Health Hazard Assessment (California EPA) |
| PAH | polycyclic aromatic hydrocarbon |
| PM_{10} | particulate matter less than 10 microns |
| $\text{PM}_{2.5}$ | particulate matter less than 2.5 microns |
| RIVM | Netherlands National Institute of Public Health and the Environment |
| RQ | risk quotient |
| SO_2 | sulphur dioxide |
| VOC | volatile organic compound |

Glossary

| Term | Definition |
|------------------------------|--|
| acute | Short-term or less than or equal to (\leq) 24 hours. |
| carcinogen | A cancer-causing substance or agent including chemicals or contaminants. |
| cardiovascular disease | A disorder of the heart and/or blood vessels. |
| chronic | Long-term (annual average). |
| hypertension | A condition, also referred to as high blood pressure, where arteries have persistently elevated blood pressure. |
| maximum point of impingement | The locations where the highest chemical concentrations in the air are predicted to occur within the boundaries of the study area. |
| receptor | A site for which air concentrations have been modelled. Air concentrations were modelled for 51 discrete human receptor locations within the study area. These receptor locations are representative of areas where people may spend extended periods of time (daycares, places of worship, parks) or live (acreages, farms, residences, and an assisted-living facility). |
| respiratory disease | Diseases affecting any of the structures and organs that have to do with breathing, including the nasal cavities, the pharynx (or throat), the larynx, the trachea (or windpipe), the bronchi and bronchioles, the tissues of the lungs, and the respiratory muscles of the chest cage. |
| risk quotient | A value or ratio used to describe the comparison of chemical exposure to a chemical exposure limit. An RQ value less than or equal to one ($RQ \leq 1$) indicates that the total predicted exposure is at or below the recommended exposure limit. A value greater than one ($RQ > 1$) may indicate that predicted exposure is above the recommended exposure limit. |

1.0 Scope and Objectives

This technical volume provides the technical details of the Human Health Risk Assessment (HHRA) for air emissions undertaken in 2014 to support the Project assessment. The HHRA objectives, methods, and findings are described. The HHRA draws significantly from the results of the air quality studies, as described in **Section 4.9 Air Quality**. Only the details pertaining to HHRA are provided in this appendix.

The purpose of this HHRA was to evaluate the potential for adverse effects on human health as a result of Project-related changes in air emissions. The study components, major objectives, and a brief overview are provided in **Table 1** and discussed below.

A starting point for the HHRA was the review and compilation of relevant health indicator data reported in recent studies of community and regional health. These data were used to describe existing conditions of current health within the region potentially affected by the Project (i.e., the City of Richmond and Corporation of Delta) and allowed for comparisons with the health status at the regional, provincial, and federal levels.

There is no formalized approach to HHRA for environmental assessment recommended by the B.C. Environmental Assessment Office; however, guidance on HHRA for environmental impact assessments in Alberta is available from the Government of Alberta (AHW 2011). Health Canada (2010) has issued general guidance on key elements for the assessment of potential effects of a proposed project on human health. Health Canada (2012) also provides detailed risk assessment guidance for federal contaminated sites. This HHRA for air quality generally follows the approaches recommended in these guidance documents.

Consideration was given to the predicted acute (short-term or less than or equal to 24 hours) and chronic (annual average) airborne concentrations of chemicals identified in emission sources related to the Project. Potential human exposures to Project emissions were characterized based on lifestyles, land uses, or activities that could attract people to locations within the vicinity of the Project. Individuals assumed to be exposed to Project emissions include local residents, farmers, and people involved in recreational activities within the study area. All individuals were assumed to be exposed to Project emissions via inhalation of air.

Potential health risks were characterized by comparing predicted exposures to chemicals in air, to human exposure limits defined in terms of air concentrations or chemical dose. The exposure limits used to evaluate human health risks were recommended by regulatory agencies, including Health Canada, the World Health Organization (WHO), and the U.S. EPA. These exposure limits are the best scientific and epidemiological estimates of safe levels of chemical exposure (i.e., without risk of adverse health effect).

The HHRA for air emissions incorporates layers of conservative assumptions in an effort to not underestimate potential exposure to chemicals in Project emissions. Regulatory agencies also incorporate uncertainty factors to ensure that exposure limits are protective of individuals who may be more sensitive to chemical exposure. The uncertainties associated with chemical exposures and chemical effects on human health were identified and conservative assumptions were made to bias the conclusions in the direction of being fully protective of human health in the face of any uncertainties.

Table 1 Study Components and Major Objectives

| Component | Major Objective(s) | Brief Overview |
|---------------------------------------|--|---|
| Existing Conditions Health Assessment | <ul style="list-style-type: none"> Describe existing conditions with respect to health within the region that may be potentially affected by Project emissions to air (i.e., Delta and Richmond). Compare health status indicators for the study region to health status indicators at the regional, provincial, and federal levels. | <ul style="list-style-type: none"> Identify and describe health indicators affected by changes in air quality, including asthma, lung cancer and respiratory disease. Identify and describe health indicator data for the region specifically, and for provinces and Canada as a whole. |
| Acute Inhalation Assessment | <ul style="list-style-type: none"> Characterize potential acute health risks associated with direct inhalation exposure to predicted short-term air concentrations (≤ 24 hours). Discuss the contribution of Project emissions to any acute health risks. | <ul style="list-style-type: none"> Identify chemicals in Project-related emissions that could potentially produce adverse health effects following acute inhalation. Identify receptor locations for short-term exposure duration. Quantify short-term exposure based on existing air quality conditions (2011), future air quality conditions (2031), without and with the Project, and measured ambient air concentrations. Compare predicted acute air concentrations to health-based, acute inhalation exposure limits. Describe and discuss the potential for health risks under the acute inhalation exposure scenarios considered. |
| Chronic Inhalation Assessment | <ul style="list-style-type: none"> Characterize potential chronic health risks associated with direct inhalation exposure to predicted long-term air concentrations (annual average). Discuss the contribution of Project emissions to any chronic health risks. | <ul style="list-style-type: none"> Identify receptors and chemicals for which potential adverse health effects could occur with long-term exposure to annual average air concentrations. Compare predicted chronic air concentrations to health-based chronic inhalation exposure limits. Describe and discuss the potential for health risks under the chronic inhalation exposure scenarios considered. |

2.0 Existing Health Data

2.1 Overview

The intent of the review of existing health data was to provide general information regarding the current health of individuals in communities potentially affected by the Project in the context of the health status for larger regions within B.C. and Canada. Existing studies were identified for communities in the study area (i.e., municipalities of Richmond and Delta), and elsewhere in B.C., other provinces and territories, and Canada as a whole. These studies were produced by the Fraser Health Authority, B.C. Ministry of Health, Statistics Canada, and Health Canada. Key health indicator data available for communities in the study area were compared to data available for populations at provincial, territorial, and federal levels.

Health indicators that could potentially be affected by changes in air quality were selected for evaluation. These indicators include cancer (all forms, including lung cancer), asthma, chronic obstructive pulmonary disease (COPD) including chronic bronchitis and emphysema, hypertension, cardiovascular disease including ischemic heart disease and congestive heart failure, and general respiratory systems disease. The prevalence of smoking in the populations under evaluation was also considered. The following criteria were used to measure the incidence of disease and mortality within a population:

- Age-standardized incidence rate (ASIR) – representing the incidence rate (i.e., per 100,000 individuals) for a specified condition, standardized to the age structure of the Canadian population to account for changes in age distribution over time.
- Age-standardized mortality rate (ASMR) – representing the rate of mortality resulting from a specified condition, standardized to the age structure of the Canadian population to account for changes in age distribution over time.
- Prevalence – representing the percentage of the population affected by a specified condition.

2.2 Health Data Comparison

Available health data from Statistics Canada (2013a, 2008) and the Canadian Cancer Society (2013) for B.C., other provinces and territories, and Canada as a whole were compared. Data from the Fraser Health Authority (2012) were used to compare the health status reported for individuals in the Corporation of Delta to those in the greater Fraser Health Authority region and in B.C. Data from Statistics Canada (2013a) were used to compare the health status of individuals in the City of Richmond (Richmond) to those in B.C.

The data for B.C. suggest lower disease incidence/mortality rates compared to Canada and other individual provinces and territories. Corporation of Delta (Delta) residents rank well on a number of health status indicators (i.e., lower incidence of or mortality from lung cancer, cardiovascular disease, respiratory disease, and COPD) compared to the Fraser Health Authority region and B.C. A notable exception is a higher prevalence of asthma and smoking. Richmond reports consistently lower age-standardized mortality rates, prevalence of disease (i.e., asthma), and smoking compared to B.C.

2.2.1 Canada, British Columbia, and other Provinces and Territories

Health indicator data available for lung cancer, cardiovascular disease, asthma, COPD, hypertension, and smoking prevalence are summarized in **Table 2**. Overall, the data for B.C. compare favourably (i.e., lower disease incidence/mortality rates) to the data for Canada and other provinces and territories.

The age-standardized 2012 incidence and mortality rates for lung cancer in B.C. (Canadian Cancer Society 2013) were below Canadian rates and ranked at or below the rates reported for all provinces and territories, with the exception of the Yukon (ASIR for males) and Ontario (ASMR for females).

The 2008 mortality rate for major cardiovascular disease (Statistics Canada 2008) and the prevalence of asthma and COPD in 2012 (Statistics Canada 2013b) were marginally higher in females from B.C. compared to Canada and some other provinces and territories. For males in B.C., the 2008 mortality rate for major cardiovascular disease and the 2012 prevalence of asthma and COPD were below the rates reported for Canada and the majority of other provinces and territories.

The hypertension incidence in B.C. males and females in 2012 was below the incidence rate reported for Canada and many other provinces and territories. The prevalence of smoking for both sexes in B.C. was below national, provincial, and territorial rates for 2012 (Statistics Canada 2013b).

2.2.2 British Columbia, the Fraser Health Authority Region, and Delta

Selected health indicators for B.C., the Fraser Health Authority region, and the Corporation of Delta are summarized in **Table 3**. The Fraser Health Authority region includes 36 per cent of the B.C. population as of 2012, and includes the communities of Delta, Langley, Surrey, White Rock, Abbotsford, Mission, Chilliwack, Hope, Agassiz/Harrison, Burnaby, Coquitlam, Maple Ridge, and New Westminster (B.C. Stats Socioeconomic Profiles 2012).

Overall, Delta residents ranked well on a number of health status indicators (i.e., lower incidence of or mortality from lung cancer, cardiovascular disease, respiratory disease, and COPD), compared to the Fraser region and B.C. A notable exception was the higher prevalence of asthma in Delta compared to the Fraser Health Authority region and B.C. Residents of Delta also had the highest smoking prevalence when compared to the Fraser Health Authority region and province of B.C. (Health & Business Analytics, Fraser Health Authority 2012).

Table 3 Health Status Data for British Columbia, the Fraser Health Authority Region, and Delta

| Health Indicator ¹ | B.C. | Fraser Health | Delta |
|---|------|---------------|-------|
| Age-Standardized Incidence Rates per 100,000 people – 2008 | | | |
| Lung Cancer (age 20+ years) | | | |
| Males | 77.1 | 76.8 | 60.6 |

Note: ¹ Health & Business Analytics, Fraser Health Authority (2012)

2.2.3 British Columbia and Richmond

Selected health indicators available for B.C. and Richmond are summarized in **Table 4**. Richmond has consistently lower age-standardized mortality rates and prevalence of disease (i.e., asthma) compared to B.C. Prevalence of smoking in Richmond is also below that of B.C.

Table 4 Health Status Data for Richmond and British Columbia

3.0 Methods

The evaluation of human health risks associated with Project-related air emissions was carried out using methods recommended by the U.S. EPA (2005), the Government of Alberta (AHW, 2011), and Health Canada (2010; 2012), and followed the key steps illustrated in **Figure 1**.

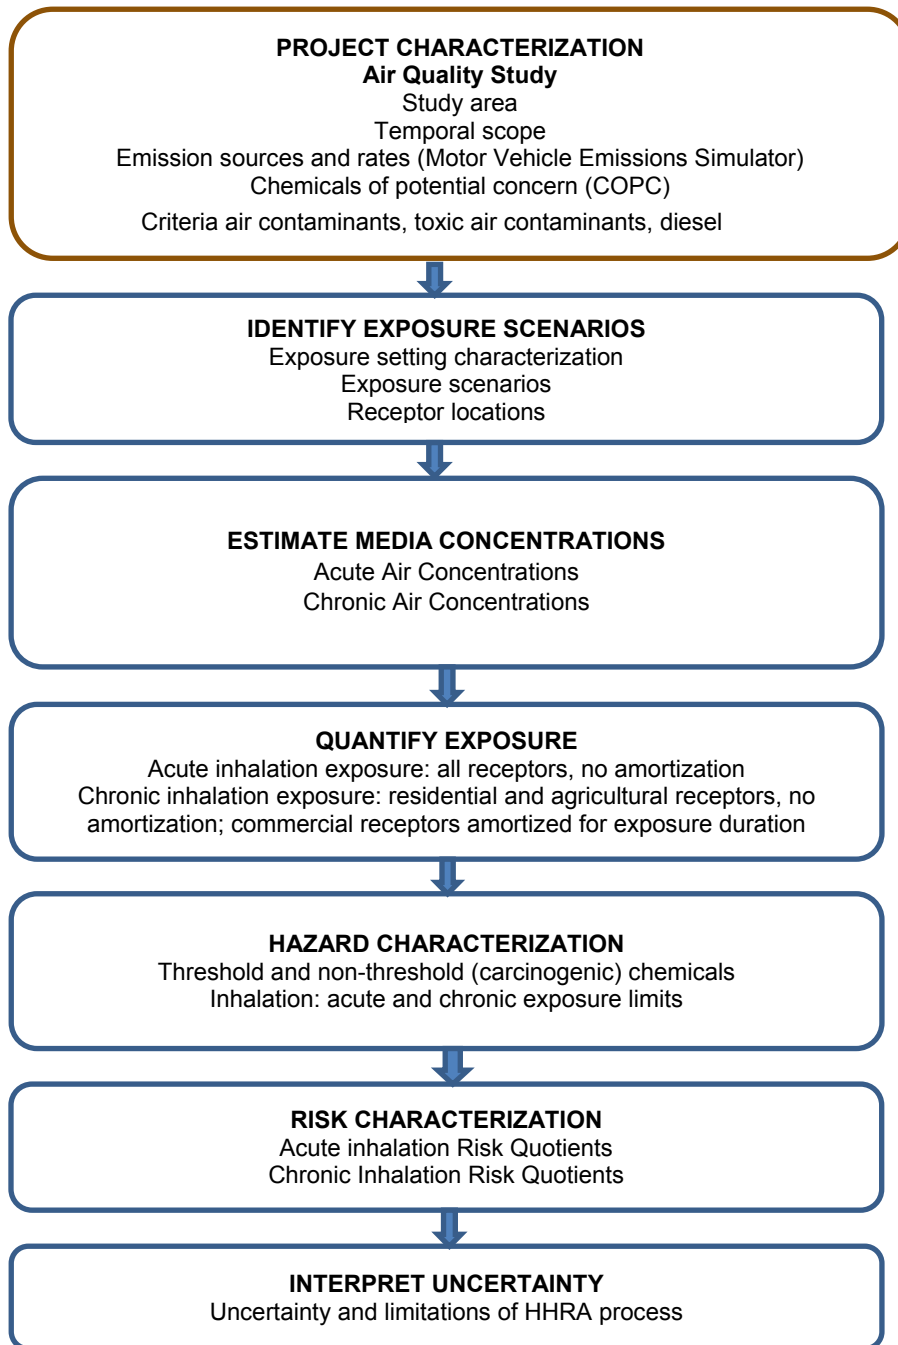

Figure 1 Human Health Risk Assessment Process (adapted from U.S. EPA 2005)

3.1 Project Characterization

3.1.1 Temporal Scope

The HHRA for air emissions accounts for temporal variability in air quality as a result of Project emissions. The HHRA for air emissions study reflects the methods and temporal scope described in **Section 4.9 Air Quality**, and evaluated potential human health risks associated with the existing (2011) conditions (including measured ambient air quality data from 2010), the future (2031) without the Project, and with the Project.

The HHRA focused on the potential health effects resulting from a change in future air quality conditions by comparing risk estimates for existing conditions to risk estimates for future conditions, without and with the Project. In addition, air concentrations as a result of emissions from the Project alone, represented by the difference between the future (2031) with the Project and the future without the Project, were considered for the assessment of incremental cancer risks associated with Project emissions (AHW 2011).

3.1.2 Project Emissions

The primary emission sources for the Project were considered to be vehicles travelling the Highway 99 corridor. The suspension of particulate matter (road dust) from the friction of tires on pavement was also considered. Vehicle emissions from traffic are influenced by the traffic pattern, volume, and vehicle fleet composition, as well as vehicle speed, fuel efficiency, and distance travelled, all of which were considered as part of **Section 4.9 Air Quality**. Vehicle emission estimates were calculated using the U.S. EPA (2012) Motor Vehicle Emissions Simulator (MOVES) computer modelling program, which generated emissions factors for highway motor vehicles and motorcycles fuelled by gasoline, diesel or compressed natural gas.

3.1.3 Chemicals of Potential Concern

All prioritized airborne contaminants associated with Project emissions were selected as chemicals of potential concern (COPC) for the evaluation of human health risks. The exceptions were parameters related to climate change or ground-level ozone formation, for which toxicity-based exposure guidelines were not available; i.e., greenhouse gases expressed as carbon dioxide equivalents, climate forcing particulate matter, volatile organic compounds (VOCs) expressed as a group, and the nitrogen oxides group, expressed as NO_x.

The COPC selected for the evaluation of human health risks are as follows:

- Sulphur dioxide (SO₂)
- Nitrogen dioxide (NO₂)
- Ammonia (NH₃)
- Carbon monoxide (CO)
- Particulate matter (PM₁₀ and PM_{2.5})
- Diesel particulate matter (DPM)
- Acetaldehyde
- Acrolein
- Benzene
- Benzo[a]pyrene (B[a]P)
- 1,3-butadiene
- Naphthalene
- Formaldehyde

The compounds considered in the HHRA for air emission include those that have been identified by the U.S. EPA (U.S. EPA 2007) as the most significant contributors to health risks as a result of breathing air toxins from mobile transportation sources (gasoline and diesel combustion engines) in outdoor air, including benzene, 1,3-butadiene, formaldehyde, acrolein, naphthalene, polycyclic organic matter, and diesel particulate matter. Acetaldehyde was added to the list of COPC based on its inclusion in the 2001 EPA priority mobile source air toxics list (California DOT 2014). Project emissions of polycyclic aromatic hydrocarbons (PAH) were represented by benzo[a]pyrene.

Although ozone is not directly emitted by vehicles, other chemicals and chemical groups in vehicle emissions could affect ozone formation as chemical precursors and catalysts in photochemical reactions (i.e., nitrogen oxides and VOCs). The study to support **Section 4.9 Air Quality** included an evaluation of the effect of Project emissions on ground-level ozone concentrations and concluded that the change in ozone concentrations would be negligible). Ozone was therefore not included as a COPC in the HHRA for air emissions.

The majority of COPCs are gaseous chemicals (NH₃, CO, NO₂, and SO₂), volatile organic compounds, or fine particulate matter (PM_{2.5}, PM₁₀ and DPM). These chemicals primarily occur in air and are not considered a health concern via exposures other than direct inhalation of air. However, some chemicals with limited volatility have the potential to deposit from air onto soil,

water and plants and may be subsequently accumulated in plant and animal tissue. Exposure limits for these chemicals have been developed based on systemic effects in humans that may occur following ingestion and dermal exposures.

Chemicals with sufficiently limited volatility to become deposited and accumulated in plant or animal tissues were identified based on the following physical-chemical properties (US EPA 2003):

- molecular weight \geq 200 grams/mole;
- Henry's Law Constant \leq 0.00001 atmosphere- m^3 /mole;
- vapour pressure \leq 0.001 mm Hg, and
- Log K_{ow} $>$ 3.5.

The only COPC that met all of these conditions was benzo[a]pyrene. Formaldehyde met the conditions for limited volatility but would not accumulate in plant or animal tissues (**Table 5**).

Table 5 Physical Chemical Properties of COPC Considered for Multi-media Assessment

| COPC | Volatility | | | Bioaccumulation | Reference |
|----------------|-------------------------------|--|--------------------------------------|-----------------|-------------|
| | Molecular Weight (grams/mole) | Henry's Law Constant (atmosphere- m^3 /mole) | Vapour Pressure (mm Hg) ¹ | Log Kow | |
| Acetaldehyde | 44.05 | 0.0000789 | 904.4 | 0.61 | US EPA 2005 |
| Formaldehyde | 30.03 | 0.000000336 | 5236.4 | 0.35 | US EPA 2005 |
| Acrolein | 56.06 | 0.00012 | 269.8 | -0.01 | US EPA 2005 |
| Benzene | 78.06 | 0.0056 | 95 | 2.1 | US EPA 2005 |
| Butadiene | 54.09 | 0.074 | 2110 | 1.99 | ATSDR 2012 |
| Benzo[a]pyrene | 252.32 | 0.0000011 | 5.50E-9 | 6 | US EPA 2005 |
| Naphthalene | 128.18 | 0.00048 | 0.08512 | 3.3 | US EPA 2005 |

¹Assuming 1 atmosphere = 760 mm Hg

Bold – meets criteria for limited volatility or bioaccumulation

3.2 Air Dispersion Modelling

Air dispersion modelling was conducted by WSP to predict air concentrations at discrete receptor locations where humans could be exposed to Project emissions. The air concentration data provided by WSP is summarised in **Attachment A**. Further details on emission sources and the air quality dispersion modelling approach are provided in **Section 4.9 Air Quality**. As described by in this section, conservative assumptions have been made in the assessment of air emissions and dispersion modelling, such that the predicted existing and future air concentrations of COPC have likely been overestimated rather than underestimated.

3.2.1 Exposure Setting

The study area to support the assessment encompassed a one-kilometre zone along Highway 99 footprint from Bridgeport Road in Richmond to Ladner Trunk Road in Delta, within which it is assumed that Project emissions will be dispersed and where measurable changes to air quality could occur. Current land uses overlapping the proposed Project components include agricultural, commercial, residential, and recreational. Land uses were assumed to remain the same in the future.

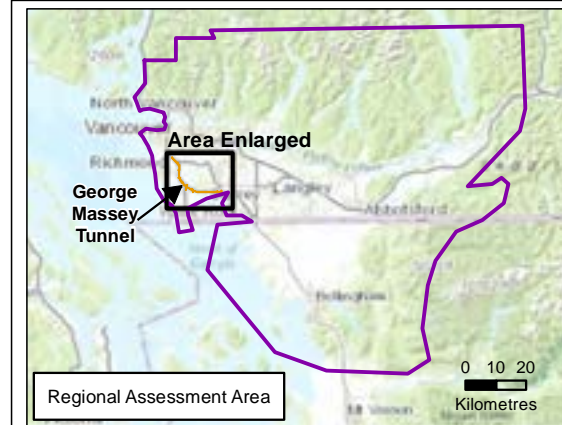

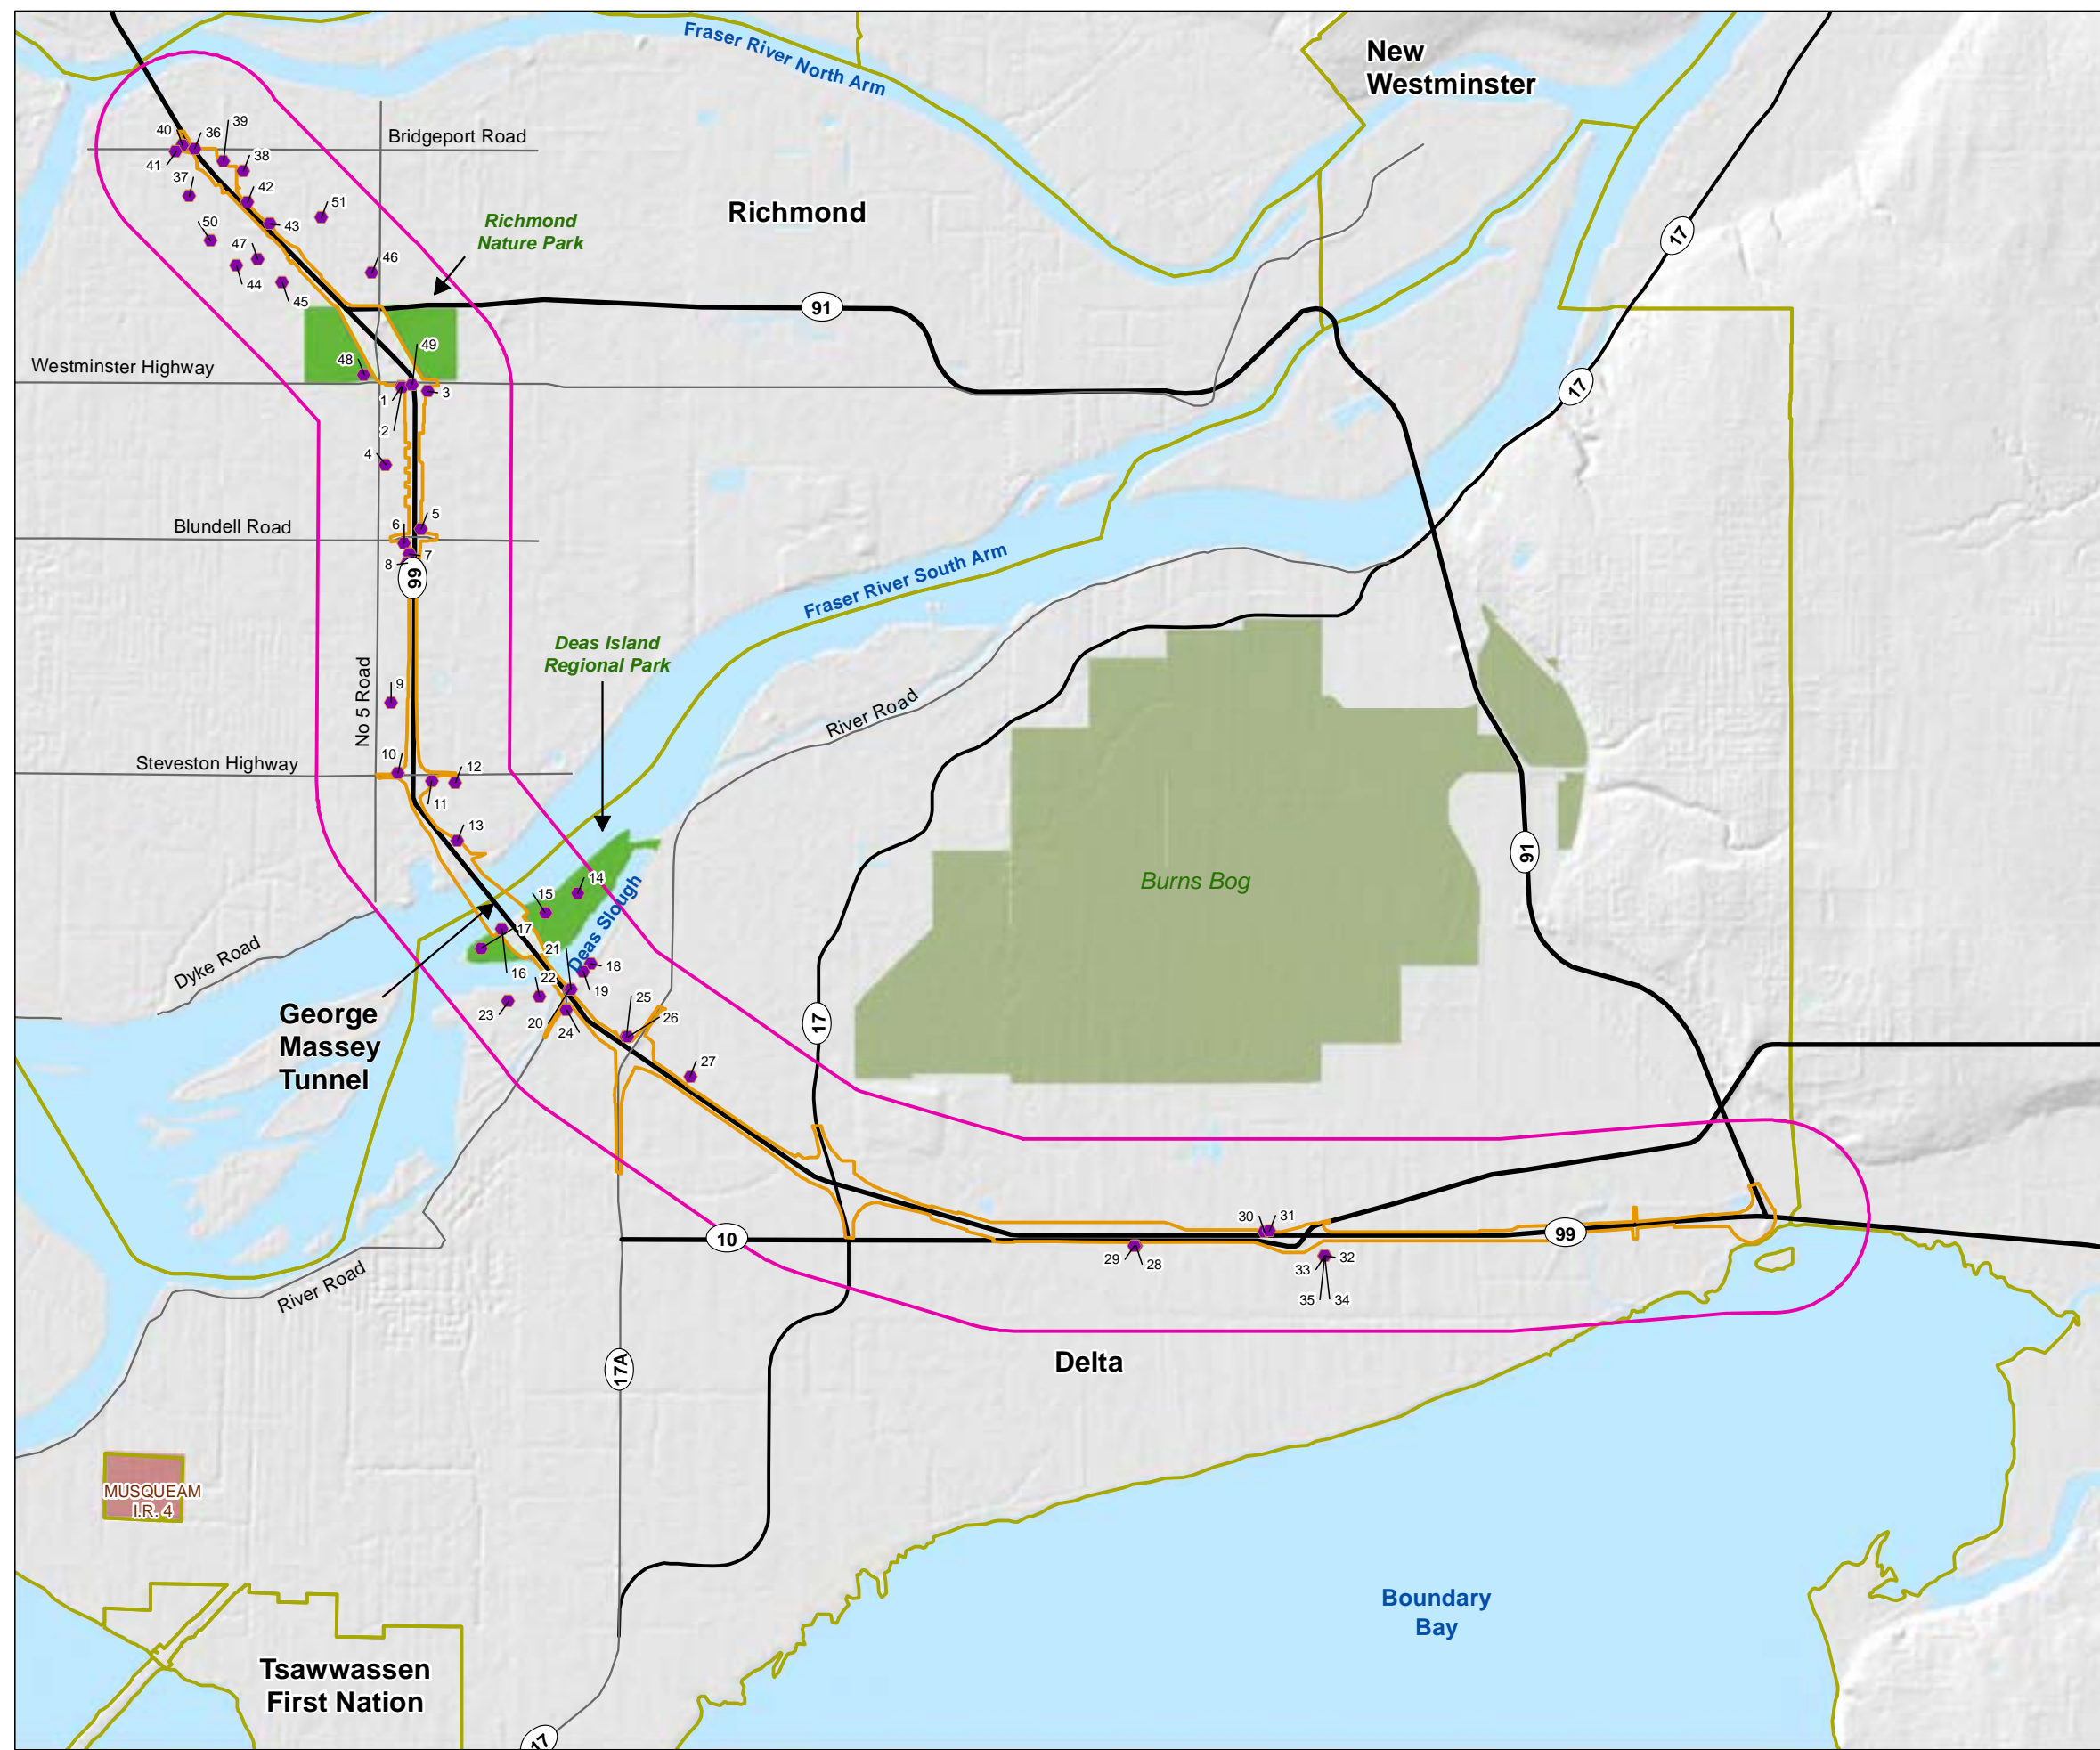

3.2.2 Receptor Locations

Air concentrations were modelled at 51 discrete human receptor locations within the study area. These receptor locations are representative of areas where people may spend extended periods of time (daycares, places of worship, parks), live (acreages, farms, residences, and an assisted-living facility) or work (commercial buildings). The land use for each of the 51 receptor locations is identified in **Table 6**. The receptors locations considered within Delta and Richmond are illustrated in **Figure 2**.

Table 6 Land Use for Receptor Locations Considered in the HHRA for Air Quality

| Agricultural Receptors | Commercial Receptor | Recreational Receptors | Residential Receptor |
|--|-----------------------------------|--|---|
| 1, 2, 3, 4, 5, 11, 12, 13 24, 27, 28, 29 32, 33, 34, 35 49 | 36, 38, 39, 40, 41, 42, 43, 46 | 14, 15, 16, 17 22 44, 45, 48 51 | 6, 7, 8, 9, 10, 18, 19, 20, 21 23, 25, 26 30, 31, 37 47 50 |

**GEORGE MASSEY TUNNEL
REPLACEMENT PROJECT**

HHRA AIR QUALITY RECEPTOR LOCATIONS

| | |
|----------|------------|
| Figure 2 | 02/05/2016 |
|----------|------------|

In addition to the 51 discrete receptor locations, maximum points of impingement (MPOI) identified within the boundaries of Richmond and Delta were conservatively included for an assessment of acute, worst-case exposures. These MPOI represent the locations where the highest chemical concentrations in the air are predicted to occur. The highest air concentrations were predicted within five to 15 metres of the road in areas where there are a high number of vehicles. Under the existing conditions, and future conditions without the Project, this occurs at either entrance to the Tunnel.

3.3 Exposure Concentrations

3.3.1 Air

Ambient air quality was based on measured data available from air quality monitoring stations in the Lower Mainland operated by Metro Vancouver. These data were considered representative of baseline air quality in the Project Area. Ground-level air concentrations were predicted based on air dispersion modelling of existing (2011) emissions and future (2031) emissions, with and without the Project. Ambient and predicted air concentrations were available for acute (24 hours or less) and chronic (annual average) averaging periods, allowing for the assessment of the effects of short-term and long-term inhalation exposures.

Exposures to threshold (non-carcinogenic) COPC were estimated by adding upper estimates of ambient air concentrations with modelled air concentrations. For carcinogenic COPC, the incremental change in air concentration as a result of the Project (i.e., Future conditions with Project minus Future conditions without the Project) was considered in the estimate of incremental lifetime cancer risk, consistent with guidance by Health Canada and other agencies.

The ambient air data assumed for each exposure scenario and the predicted air concentrations (acute and chronic) for all receptor locations under existing (2011) and future (2031) conditions with and without Project are provided in **Attachment A**.

3.3.2 Media other than Air

Formaldehyde and B[a]P were identified as chemicals having the potential to deposit from air onto soil, water and plants. For the purpose of the HHRA, WSP conducted a modelling assessment of maximum predicted annual concentrations of formaldehyde and B[a]P on agricultural land (at least 20 m away from the roadway) in both Delta and Richmond. The predicted air concentrations for future emissions with the Project were compared to air concentrations for future emissions without the Project and baseline conditions. In all cases, the future scenario with the Project resulted in lower air concentrations (**Table 7**). Since the Project

results in a decrease in annual air concentrations of formaldehyde and B[a]P on agricultural land in Delta and Richmond, it would not result in additional exposures to these chemicals via media other than air. Therefore, the HHRA restricted the assessment of potential health risks associated with Project emissions to chemicals in air.

Table 7 Maximum Predicted Annual Concentrations (µg/m³) for B[a]P and Formaldehyde

| Location | Chemical | 2011 | Future with Project (2031) | Future without Project (2031) |
|----------|--------------|----------|----------------------------|-------------------------------|
| Delta | B[a]P | 1.71E-02 | 1.01E-02 | 5.75E-03 |
| | formaldehyde | 5.18E-01 | 4.01E-01 | 1.64E-01 |
| Richmond | B[a]P | 1.71E-02 | 1.09E-02 | 6.43E-03 |
| | formaldehyde | 5.82E-01 | 4.35E-01 | 1.83E-01 |

3.4 Quantifying Exposure

3.4.1 Inhalation Exposure Assessment

The HHRA for air emissions considered acute and chronic inhalation exposures to airborne concentrations of COPC predicted for existing (2011) conditions, and future (2031) conditions without and with the Project. Airborne concentrations predicted for the Project alone (future scenario with the Project minus future scenario without the Project) were considered for the assessment of chronic inhalation exposure to carcinogenic COPC.

For acute exposures, ambient air concentrations were added to the maximum predicted air concentrations resulting from vehicle emissions (existing and both future scenarios). Similar assumptions were made for chronic exposures to non-carcinogens, where relatively high (i.e., mean 24-hour concentrations) were assumed to represent annual (yearly) ambient air concentrations under the existing and future exposure scenarios. Therefore, it was conservatively assumed that (i) existing-scenario emissions do not contribute to measured ambient air concentrations, and (ii) there would be no improvements in ambient air quality under the future scenarios.

Acute inhalation exposures were assessed at the discrete receptor locations for agricultural, commercial, recreational and residential receptors, as well as at the predicted acute MPOI in Richmond and Delta. Acute or short-term exposures to Project COPC were assumed to range in duration from 10 minutes to 24 hours, depending on the length of the exposure period upon which the COPC toxicity reference value was derived.

Chronic exposures were assessed at the discrete receptor locations for residents, farmers and commercial workers, where long-term exposures would be expected. Chronic exposures of residents and farmers were based on predicted annual average air concentrations, and were assumed to occur 24 hours per day, 365 days per year, over a lifetime. Commercial receptors were assumed to be exposed for 8 hours per day, 5 days per week for 52 weeks per year, over a lifetime.

The predicted air concentration data (acute and chronic) for all receptor locations under existing (2011) and future (2031) conditions with and without Project, as well as for the alone, are provided in **Attachment A**. The ambient air data considered for acute and chronic inhalation exposures are also provided in this appendix.

3.5 Hazard Characterization

Hazard characterization is the process by which potential adverse health effects from exposure to a chemical are determined. The outcome of the hazard characterization process is the identification of an exposure level at or below which adverse health effects are unlikely to occur, i.e., an exposure limit, for each of the COPC in Project-related air emissions.

The relationship between chemical exposure and adverse response is characterized by a dose-response assessment, the outcome of which is a dose-response curve that provides a graphic illustration of the exposure levels at which adverse effects occur. An increase in exposure dose will generally result in an increase in response. The shape of the dose-response relationship is chemical-specific and endpoint-specific (i.e., specific to the response under evaluation).

A non-linear dose-response relationship suggests there is a threshold for toxicity, below which adverse health effects are not expected to occur. Non-linear dose-response relationships are observed for non-carcinogenic chemicals. Exposure limits for non-carcinogens are based on the identification of this threshold, for example, a no observable adverse effect level (NOAEL). Uncertainty factors are applied to a NOAEL to incorporate additional safety for the response of sensitive individuals and, where a threshold level is identified from an animal study, for the extrapolation of the observed effect in animals to humans, including adjustments for differences in exposure duration and exposure dose. Therefore, an exposure limit does not represent a threshold above which adverse health effects are expected to occur but rather incorporates a margin of safety so that the exposure limit is set well below any observed adverse effect level.

A linear dose-response relationship suggests there may be no threshold for adverse effects (i.e., exposure to any amount of chemical is assumed to result in a response). Linear dose-response relationships are assumed for carcinogenic chemicals and therefore the exposure limits developed for carcinogens are cancer-risk-specific and based on predictions of excess lifetime cancer risk. Public health agencies establish risk management levels for carcinogens based on an acceptable increase in lifetime cancer risk. Permissible lifetime cancer risk levels range from one in 10,000 to one in 1,000,000. Health Canada (2012) has determined that a cancer risk less than or equal to one in 100,000 is essentially negligible. Exposure limits for carcinogens were therefore derived such that the lifetime risk of cancer development as a result of carcinogen exposure would be essentially negligible (below one in 100,000 above existing cancer risk levels).

In the case of particulate matter (PM_{10} and $PM_{2.5}$), which represents a mixture of varying physical, biological, and chemical characteristics, the health effects evidence to date does not allow for identification of a threshold level below which adverse health effects are not observed. Population-based (epidemiological) studies have associated acute and chronic exposure to PM, particularly $PM_{2.5}$, with increased hospitalizations, respiratory and cardiac events, and mortality. Similar studies have provided evidence of health improvement with the reduction of airborne particulate concentrations. The exposure limits recommended for PM are intended to reduce health effects to a minimum (WHO 2013, 2014).

Exposure limits recommended by toxicologists and epidemiologists from a range of provincial, federal, and international regulatory agencies were reviewed for the identification of the most appropriate exposure limit for each COPC. These agencies include the following:

- Agency for Toxic Substances and Disease Registry (ATSDR)
- American Conference of Governmental Industrial Hygienists (ACGIH)
- B.C. Ministry of Environment (B.C. MOE)
- California Office of Environmental Health Hazard Assessment (OEHHA)
- Canadian Council of Ministers of the Environment (CCME)
- Health Canada
- Texas Commission on Environmental Quality (TCEQ)
- U.S. EPA
- World Health Organization (WHO)
- Netherlands National Institute of Public Health and the Environment (RIVM)

Exposure limits specific to acute and chronic inhalation exposure scenarios were reviewed for each COPC identified in Project-related emissions. The following attributes were reviewed and summarized for each chemical and available exposure limit:

- Key toxicology (animal) or epidemiology (human) study
- Primary effect or chemical mode of action
- Point of departure or starting point for subsequent extrapolations and analyses (lowest effect dose that is adequately supported by dose-response data)
- Dosimetric adjustments for animal to human exposures
- Uncertainty factors

In general, the most stringent exposure limit was used to determine the potential hazards associated with exposure to COPC in Project emissions to air, taking into consideration that derivation of the limit was adequately documented and scientifically defensible. The adopted exposure limits all include uncertainty factors that further reduced the presumed acceptable exposure limit for the protection of individuals who may be more sensitive to chemical exposure. The acute and chronic inhalation exposure limits are summarised below. Further details on each of the exposure limits identified for the HHRA are provided in **Attachment B**.

3.5.1 Acute Inhalation Exposure Limits

A summary of the exposure limits selected for the assessment of acute inhalation exposures to Project-related COPC is provided in **Table 8**. The averaging time, primary effect following acute inhalation exposure and the agency responsible for developing the selected exposure limit are also provided.

Table 8 Summary of Acute Inhalation Exposure Limits

| Chemical / Substance | Averaging Time | Acute Inhalation Exposure Limit ($\mu\text{g}/\text{m}^3$) | Health Endpoint | Agency |
|----------------------|----------------|--|--|-----------------|
| CO | 1 hr | 15,000 | Hypoxia | Health Canada |
| | 8 hr | 6,000 | | |
| NO ₂ | 1 hr | 188 | Respiratory irritation | U.S. EPA |
| SO ₂ | 10 min | 500 | <ul style="list-style-type: none"> • Change in pulmonary function • Respiratory irritation | WHO U.S. EPA |
| | 1 hr | 200 | | |
| PM _{2.5} | 24 hr | 25 | Increase in population mortality or morbidity | WHO |
| PM ₁₀ | 24 hr | 50 | Increase in population mortality or morbidity | WHO |
| Ammonia | 1 hr | 590 | Eye and respiratory irritation | TCEQ |
| Acetaldehyde | 1 hr | 470 | Respiratory irritation | OEHHA |
| Acrolein | 1 hr | 2.5 | Eye irritation | OEHHA |
| Benzene | 1 hr | 580 | Immunological | TCEQ |
| 1,3-butadiene | 1 hr | 660 | Developmental | OEHHA |
| | 24 hr | 15 | | U.S. EPA |
| Formaldehyde | 1 hr | 50 | Eye and nasal irritation | ATSDR |
| Naphthalene | 1 hr | 2,000 | Eye and respiratory irritation | ACGIH |

3.5.2 Chronic Inhalation Exposure Limits

The exposure limits selected for the assessment of chronic inhalation exposures to Project-related COPC are provided in **Table 9**, as well as the primary effect following chronic inhalation exposure, and the agency responsible for developing the selected exposure limit. The averaging time for all substances is annual.

Table 9 Summary of Chronic Inhalation Exposure Limits – Annual Averaging Time

| Chemical/ Substance | Chronic Inhalation Exposure Limit ($\mu\text{g}/\text{m}^3$) | Health Endpoint | Agency |
|-------------------------------|---|---|-----------------------------|
| NO ₂ | 40 | Respiratory illness in sensitive individuals | WHO |
| SO ₂ | 25 | Not described | B.C. MOE |
| PM _{2.5} | 6 | Increase in population morbidity or mortality | B.C. MOE Metro Vancouver |
| PM ₁₀ | 20 | Increase in population morbidity or mortality | WHO |
| DPM | 5 | Pulmonary inflammation | U.S. EPA |
| | 0.03 | Lung cancer | OEHHA |
| Ammonia | 200 | Pulmonary function | OEHHA |
| Acetaldehyde | 390 | Nasal irritation | Health Canada |
| | 3.7 | Nasal tumours | OEHHA |
| Acrolein | 2.7 | Nasal irritation | TCEQ |
| Benzene | 9.8 | Immunological/ hematological | ATSDR |
| | 1.3 | Leukemia | U.S. EPA |
| Benzo(a)pyrene (PAH group) | 0.00012 | Lung cancer | WHO |
| 1,3-butadiene | 2 | Ovarian atrophy | U.S. EPA |
| | 0.3 | Leukemia | |
| Formaldehyde | 9 | Eye, nasal, respiratory irritation | OEHHA |
| | 2 | Nasal tumors | Health Canada |
| Naphthalene | 3 | Nasal irritation | U.S. EPA |

Where an agency recommends non-cancer and cancer exposure limits for the same chemical, both endpoints were included in the assessment. The exposure limit for a non-cancer endpoint is generally higher (i.e., less conservative) compared to an exposure limit based on a cancer endpoint, however, it was important to consider the non-carcinogenic effects of all COPC for the evaluation of multiple chemical exposures, as described below.

3.5.3 Multiple Chemical Exposure

Chemical exposures do not occur in isolation of one another; therefore, when evaluating exposure to a group of chemicals it is important to consider the potential risks as a result of interactions between the chemicals. Possible chemical interactions include the following:

- Additive – combined effect of greater than or equal to two chemicals is equal to the sum of the individual effects)
- Antagonistic – effect of one chemical blocks or reduces the effect of another
- Synergistic – combined effect of greater than or equal to two chemicals is greater than the sum of the individual effects
- Potentiate – effect of one chemical significantly increases the effect of another (AHW 2011)

The scientific knowledge about interactive effects of exposure to multiple chemicals is very limited, especially considering the range of possible effects resulting from multiple combinations of chemicals at various exposure concentrations. Some headway has been made in the case of a few closely related groups of chemicals, for example, toxic potency equivalence factors have been derived for carcinogenic PAHs and polychlorinated dibenzo-p-dioxins and furans for the purpose of assessing the group using a single toxicity metric (U.S. EPA 1989, Health Canada 2012). The ATSDR (2004) and U.S. EPA (1999, 2000, 2007) also provide guidance to regulatory scientists for the assessment of chemical mixtures. In the absence of guidance specific to the interactions of the COPC considered in the HHRA for air emissions, the following Health Canada (2012) recommendations were assumed for the evaluation of chemical mixtures:

- Non-carcinogens – An additive interaction should be assumed for non-carcinogenic chemicals with similar target tissues and mechanisms of action. No interactions should be assumed between non-carcinogenic chemicals with unique and dissimilar mechanisms of action.
- Carcinogens – An additive interaction should be assumed for carcinogenic chemicals determined to have similar target tissues and mechanisms of action. No interaction should be assumed between carcinogenic chemicals with unique and dissimilar mechanisms of action, target organs, and/or forms of cancer.

For the purpose of the HHRA for air emissions, the interaction between chemicals with similar health endpoints (i.e., target tissues) was assumed to be additive, even though a similar mechanism of action on target tissues may not be clearly defined.

A summary of the chemical mixtures and health endpoints considered for acute inhalation and chronic inhalation exposures is provided in **Table 10**, based on the exposure limits and endpoints identified in **Table 8** and **Table 9**. Chemicals with clearly defined unique mechanisms of action or unique health endpoints were assessed individually.

Table 10 Chemical Mixtures

| Exposure Duration | Health Endpoint of Chemical Mixtures | COPC in Chemical Mixtures |
|--------------------|--------------------------------------|--|
| Acute Inhalation | Eye irritation | Acrolein Ammonia Formaldehyde Naphthalene |
| | Respiratory irritation | Acetaldehyde Naphthalene Nitrogen dioxide Sulphur dioxide |
| Chronic Inhalation | Nasal irritation | Acetaldehyde Acrolein Formaldehyde Naphthalene |
| | Nasal tumours | Acetaldehyde Formaldehyde Naphthalene |
| | Lung tumours | Diesel particulate matter Benzo[a]pyrene |
| | Leukemia | Benzene 1,3-butadiene |

3.6 Risk Characterization Method

Risk characterization involved the comparison of predicted receptor exposure to the exposure limit for each chemical identified in Project emissions. In the case of acute and chronic inhalation exposure to chemicals in air, receptor exposures were described as air concentrations (i.e., $\mu\text{g chemical}/\text{m}^3$ air). Acute exposure concentrations were compared to exposure limits defined in terms of acceptable air concentrations over an acute exposure duration (10 minutes, 1-hour, or 24 hours). Chronic exposure concentrations were directly compared to acceptable exposure limits for chronic exposure duration (i.e., 24 hours per day, 52 weeks a year over a lifetime). For commercial receptors, chronic exposure was assumed to occur 8 hours/day, 7 days/week for 42 weeks of the year.

A risk quotient (RQ) describes the comparison of chemical exposure to a chemical exposure limit and is used to determine if predicted exposures exceed recommended exposure limits. The RQ is inherently uncertain since it is based on predictions and assumptions in the case of both the exposure and toxicity estimates. Throughout the risk assessment process, conservative assumptions are made to address uncertainty and every attempt is made not to underestimate potential human health risks. The exposure assessment in particular is based on point estimates of predicted (modelled) air concentrations, which assume worst-case air emission and dispersion conditions. Inherent in the estimates of exposure, and subsequently health risk, is the assumption that an individual will inhale predicted outdoor air concentrations for time periods that extend beyond the duration most Canadians (but perhaps not Vancouverites) spend outdoors.

These conservative assumptions preclude the use of RQ values as measurements of health risk. Rather, the RQ value is useful as a screening tool to determine whether, having evaluated a worst-case scenario, assumptions of chemical exposure or the toxicity can be refined to a more realistic scenario. The health risk assessment can also be used to assist with identifying when and where risk management may be required.

3.6.1 Risk Quotients for Threshold Chemicals

For non-carcinogenic chemicals, inhalation exposure was defined by the sum of ambient (measured) air concentrations plus predicted air concentrations for the existing (2011), and both future (2031) emissions scenarios. Predicted exposures were compared to a threshold exposure limit expressed as reference concentration. The following is an example of an RQ equation for a threshold chemical under existing conditions:

$$\text{RQ} = \frac{\text{Ambient air concentration plus existing (2011) emissions } (\mu\text{g}/\text{m}^3)}{\text{Reference Concentration } (\mu\text{g}/\text{m}^3)}$$

An RQ value of less than or equal to one ($\text{RQ} \leq 1$) indicates that the total predicted exposure (considering various emission sources plus ambient levels) is at or below the recommended safe exposure limit for a non-carcinogen (AHW 2011). Considering the inherent conservatism in the risk assessment process, an RQ value greater than unity or one (i.e., >1) does not indicate that adverse health effects are expected to occur but rather, triggers the need for additional evaluation and discussion of the significance of the estimated risk within the context of the exposure and toxicity assumptions made in the HHRA (AHW 2011).

Although used as a predictor of risk, the RQ value for threshold (non-carcinogenic) chemicals does not reflect the magnitude of potential adverse health effect (or lack thereof), nor does it provide information on the specific probability that an adverse effect will occur. This type of information would require a more detailed investigation into the underlying dose-response curve for the exposure limit, or statistical analyses of exposure and toxicity.

3.6.2 Risk Quotients for Non-threshold Chemicals

For carcinogenic chemicals, inhalation exposure was defined by Project-only air concentrations (i.e., future with the Project minus future without Project). This allowed for an estimate of the incremental lifetime cancer risks specific to Project emissions. The RQ value for carcinogens compared the predicted Project-only air concentration to a risk-specific concentration as follows:

$$\text{RQ} = \frac{\text{Project-only Air Concentration } (\mu\text{g}/\text{m}^3)}{\text{Risk-Specific Concentration } (\mu\text{g}/\text{m}^3)}$$

An RQ value of less than or equal to one ($\text{RQ} \leq 1$) indicates that the incremental increase in lifetime cancer risk as a result of exposure to Project emissions is negligible (i.e., at or below one in 100,000). A risk-specific concentration for carcinogens is a measure of carcinogenic risk since it represents the slope factor of the dose-response curve. Therefore, RQ values for non-threshold carcinogens can be used to determine the potential magnitude of effect.

3.6.3 Chemical Mixtures

Individual RQs for chemicals assumed to interact additively were summed to determine the cumulative risks associated with multiple chemical exposures. For example, the RQ for chemicals determined to be respiratory irritants following acute (one-hour) exposures was determined as follows:

$$\text{Acute RQ}_{\text{respiratory irritants}} = \sum \text{acute RQ}_{\text{ammonia}} + \text{acute RQ}_{\text{acetaldehyde}} + \text{RQ}_{\text{naphthalene}} + \text{RQ}_{\text{NO}_2} + \text{RQ}_{\text{SO}_2}$$

4.0 Results

The result of the HHRA for air emissions is the characterization of risk (i.e., RQ) associated with receptor exposure to Project-related emissions. The maximum RQ values determined for acute and chronic inhalation exposures are provided in the sections below. RQ values determined for all 51 receptor locations identified in **Figure 2** are provided in **Attachment A**. The predicted RQ values are reported by exposure duration (acute versus chronic) for each receptor type (i.e., agricultural, residential, recreational and commercial) and at the MPOs for Richmond and Delta.

4.1 Acute Inhalation

4.1.1 Agricultural Receptors

The maximum acute inhalation RQ values determined for agricultural receptors are summarized in **Table 11**. All of the RQ values predicted for the future (2031) with Project conditions were <1 and lower than the RQ values predicted for existing (2011) and future (2031) without Project conditions.

Table 11 Acute Inhalation Risk Quotients – Agricultural Receptors

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 hr | 0.6 | 0.5 | 0.3 |
| | 8 hr | 0.6 | 0.6 | 0.4 |
| Nitrogen dioxide | 1 hr | 0.8 | 0.7 | 0.7 |
| Sulphur dioxide | 10 min | 0.1 | 0.1 | 0.04 |
| | 1 hr | 0.1 | 0.1 | 0.1 |
| Ammonia | 1 hr | 0.1 | 0.04 | 0.03 |
| PM ₁₀ | 24 hr | 1 | 1.2 | 0.7 |
| PM _{2.5} | 24 hr | 0.8 | 0.8 | 0.5 |
| Acetaldehyde | 1 hr | 0.02 | 0.02 | 0.01 |
| Acrolein | 1 hr | 0.2 | 0.1 | 0.1 |
| Benzene | 1 hr | 0.03 | 0.02 | 0.01 |
| 1,3-butadiene | 1 hr | 0.003 | 0.002 | 0.001 |
| | 24 hr | 0.1 | 0.04 | 0.03 |
| Formaldehyde | 1 hr | 0.3 | 0.2 | 0.1 |
| Naphthalene | 1 hr | 0.001 | 0.001 | 0.001 |
| Eye Irritants ¹ | 1 hr | 0.5 | 0.4 | 0.3 |
| Respiratory irritants ² | 1 hr | 0.9 | 0.9 | 0.8 |

Notes: ¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene.

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide.

4.1.2 Residential Receptors

The maximum acute inhalation RQ values determined for residential receptors are summarized in **Table 12**. All of the RQ values predicted for the future (2031) with Project conditions were <1 and lower than the RQ values predicted for existing (2011) and future (2031) without Project conditions.

Table 12 Acute Inhalation Risk Quotients – Residential Receptors

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 hr | 0.5 | 0.4 | 0.5 |
| | 8 hr | 0.5 | 0.4 | 0.4 |
| Nitrogen dioxide | 1 hr | 0.8 | 0.7 | 0.7 |
| Sulphur dioxide | 10 min | 0.1 | 0.1 | 0.05 |
| | 1 hr | 0.1 | 0.1 | 0.1 |
| Ammonia | 1 hr | 0.1 | 0.1 | 0.03 |
| PM ₁₀ | 24 hr | 0.9 | 0.9 | 0.8 |
| PM _{2.5} | 24 hr | 0.7 | 0.7 | 0.6 |
| Acetaldehyde | 1 hr | 0.02 | 0.02 | 0.02 |
| Acrolein | 1 hr | 0.3 | 0.2 | 0.1 |
| Benzene | 1 hr | 0.03 | 0.02 | 0.02 |
| 1,3-butadiene | 1 hr | 0.003 | 0.002 | 0.002 |
| | 24 hr | 0.04 | 0.04 | 0.04 |
| Formaldehyde | 1 hr | 0.3 | 0.2 | 0.1 |
| Naphthalene | 1 hr | 0.001 | 0.001 | 0.001 |
| Eye irritants ¹ | 1 hr | 0.6 | 0.5 | 0.3 |
| Respiratory irritants ² | 1 hr | 0.9 | 0.9 | 0.8 |

¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide

4.1.3 Recreational Receptors

The maximum acute inhalation RQ values determined for recreational receptors are summarized in **Table 13**. All of the RQ values predicted for the future (2031) with Project conditions were <1 and lower than (or equal to in the case of PM₁₀) the RQ values predicted for existing (2011) or future (2031) without Project conditions.

Table 13 Acute Inhalation Risk Quotients – Recreational Receptors

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 hr | 0.4 | 0.4 | 0.4 |
| | 8 hr | 0.4 | 0.4 | 0.3 |
| Nitrogen dioxide | 1 hr | 0.8 | 0.7 | 0.7 |
| Sulphur dioxide | 10 min | 0.1 | 0.1 | 0.04 |
| | 1 hr | 0.1 | 0.1 | 0.1 |
| Ammonia | 1 hr | 0.1 | 0.05 | 0.03 |
| PM ₁₀ | 24 hr | 0.7 | 0.7 | 0.7 |
| PM _{2.5} | 24 hr | 0.6 | 0.6 | 0.5 |
| Acetaldehyde | 1 hr | 0.02 | 0.02 | 0.02 |
| Acrolein | 1 hr | 0.2 | 0.2 | 0.1 |
| Benzene | 1 hr | 0.03 | 0.02 | 0.01 |
| 1,3-butadiene | 1 hr | 0.003 | 0.002 | 0.001 |
| | 24 hr | 0.04 | 0.03 | 0.03 |
| Formaldehyde | 1 hr | 0.3 | 0.2 | 0.1 |
| Naphthalene | 1 hr | 0.001 | 0.001 | 0.001 |
| Eye irritants ¹ | 1 hr | 0.5 | 0.4 | 0.3 |
| Respiratory irritants ² | 1 hr | 0.9 | 0.9 | 0.8 |

Notes: ¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene.

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide.

4.1.4 Commercial Receptors

The maximum acute inhalation RQ values determined for commercial receptors are summarized in **Table 13**. All of the RQ values predicted for the future (2031) with Project conditions were <1 and lower than (or similar to in the case of CO and PM) the RQ values predicted for existing (2011) or future (2031) without Project conditions.

Table 14 Acute Inhalation Risk Quotients – Commercial Receptors

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 hr | 0.07 | 0.06 | 0.06 |
| | 8 hr | 0.08 | 0.08 | 0.08 |
| Nitrogen dioxide | 1 hr | 0.2 | 0.16 | 0.2 |
| Sulphur dioxide | 10 min | 0.01 | 0.01 | 0.01 |
| | 1 hr | 0.01 | 0.01 | 0.01 |
| Ammonia | 1 hr | 0.01 | 0.005 | 0.005 |
| PM ₁₀ | 24 hr | 0.2 | 0.17 | 0.17 |
| PM _{2.5} | 24 hr | 0.1 | 0.13 | 0.1 |
| Acetaldehyde | 1 hr | 0.00 | 0.003 | 0.003 |
| Acrolein | 1 hr | 0.03 | 0.02 | 0.02 |
| Benzene | 1 hr | 0.004 | 0.002 | 0.002 |
| 1,3-butadiene | 1 hr | 0.0004 | 0.0003 | 0.0003 |
| | 24 hr | 0.01 | 0.01 | 0.01 |
| Formaldehyde | 1 hr | 0.04 | 0.04 | 0.03 |
| Naphthalene | 1 hr | 0.0001 | 0.0001 | 0.0001 |
| Eye irritants ¹ | 1 hr | 0.08 | 0.06 | 0.06 |
| Respiratory irritants ² | 1 hr | 0.19 | 0.18 | 0.2 |

Notes: ¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene.

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide.

4.1.5 Maximum Point of Impingement in Delta

The highest acute inhalation RQ values determined at the MPOI in Delta are summarized in **Table 15**. The Delta MPOI represents the location where the greatest impact on acute air quality conditions could occur in the Corporation of Delta as a result of predicted existing (2011) and future (2031) emissions both without and with the Project.

For the majority of chemicals, RQ values at the Delta MPOI were ≤ 1 . The lowest RQ values were determined for predicted future (2031) conditions with the Project compared to existing (2011) conditions or future (2031) conditions without the Project. Under the predicted existing (2011) conditions, RQ values of 2 were determined for PM₁₀, and combined exposure to eye irritants. Under the future (2031) conditions without the Project, an RQ value of 2 was determined for PM₁₀.

Table 15 Acute Inhalation Risk Quotients – Delta Maximum Point of Impingement

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 hr | 1 | 1 | 0.8 |
| | 8 hr | 1 | 0.9 | 0.6 |
| Nitrogen dioxide | 1 hr | 0.8 | 0.8 | 0.7 |
| Sulphur dioxide | 10 min | 0.1 | 0.1 | 0.06 |
| | 1 hr | 0.2 | 0.2 | 0.09 |
| Ammonia | 1 hr | 0.2 | 0.2 | 0.06 |
| PM ₁₀ | 24 hr | 2 | 2 | 1 |
| PM _{2.5} | 24 hr | 1 | 1 | 0.8 |
| Acetaldehyde | 1 hr | 0.05 | 0.03 | 0.01 |
| Acrolein | 1 hr | 0.7 | 0.4 | 0.08 |
| Benzene | 1 hr | 0.1 | 0.06 | 0.03 |
| 1,3-butadiene | 1 hr | 0.01 | 0.005 | 0.003 |
| | 24 hr | 0.08 | 0.05 | 0.04 |
| Formaldehyde | 1 hr | 0.7 | 0.5 | 0.1 |
| Naphthalene | 1 hr | 0.003 | 0.002 | 0.001 |
| Eye irritants ¹ | 1 hr | 2 | 1 | 0.3 |
| Respiratory irritants ² | 1 hr | 1 | 1 | 0.9 |

Notes: Values in **bold**: RQ >1

¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide

4.1.6 Maximum Point of Impingement in Richmond

The highest acute inhalation RQ values determined at the MPOI in Richmond are summarized in **Table 16**. The Richmond MPOI represents the location where the greatest impact on air quality could occur in the City of Richmond as a result of predicted existing (2011) and future (2031) emissions conditions both without and with the Project.

For the majority of chemicals, RQ values were ≤ 1 at the Richmond MPOI, with the lowest RQ values determined for predicted future (2031) conditions with the Project. Similar to the results for Delta, RQ values of 2 were determined for PM₁₀, and combined exposure to eye irritants under existing condition and an RQ value of 2 was determined for PM₁₀ under future without Project conditions.

Table 16 Acute Inhalation Risk Quotients – Richmond Maximum Point of Impingement

| Chemical / Substance | Averaging Time | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------------|----------------|-----------------|-------------------------------|----------------------------|
| Carbon monoxide | 1 h | 1 | 1 | 0.8 |
| | 8 h | 0.9 | 0.8 | 0.6 |
| Nitrogen dioxide | 1 h | 0.8 | 0.8 | 0.7 |
| Sulphur dioxide | 10 min | 0.1 | 0.1 | 0.06 |
| | 1 h | 0.2 | 0.2 | 0.09 |
| Ammonia | 1 h | 0.2 | 0.2 | 0.06 |
| PM ₁₀ | 24 h | 2 | 2 | 1 |
| PM _{2.5} | 24 h | 1 | 1 | 0.8 |
| Acrolein | 1 h | 0.05 | 0.03 | 0.01 |
| Benzene | 1 h | 0.7 | 0.4 | 0.08 |
| 1,3-butadiene | 1 h | 0.1 | 0.06 | 0.03 |
| | 24 h | 0.01 | 0.005 | 0.003 |
| Acetaldehyde | 1 h | 0.07 | 0.05 | 0.04 |
| Formaldehyde | 1 h | 0.6 | 0.5 | 0.1 |
| Naphthalene | 1 h | 0.003 | 0.002 | 0.001 |
| Eye irritants ¹ | 1 h | 2 | 1 | 0.3 |
| Respiratory irritants ² | 1 h | 1 | 1 | 0.9 |

Notes: ¹ Combined one-hour RQ values for ammonia, acrolein, formaldehyde, and naphthalene

² Combined one-hour RQ values for ammonia, acetaldehyde, naphthalene, nitrogen dioxide, and sulphur dioxide

4.2 Chronic Inhalation: Non-carcinogenic Effects

The risk characterization results for chronic inhalation exposure are summarized in the sections and tables below for agricultural, residential and commercial receptor locations. Long-term exposures at recreational or MPOI locations are not expected to occur since there are no residences or permanent structures at these locations.

4.2.1 Agricultural Receptors – Non-carcinogenic Chemicals of Potential Concern

The maximum chronic inhalation RQ values for non-carcinogenic effects for agricultural receptors are provided in **Table 17**. For the majority of chemicals, RQ values were ≤ 1 , with the lowest values determined for predicted future (2031) conditions with the Project. An RQ value of 2 was determined for chronic exposure to NO₂ under existing conditions.

Table 17 Chronic Inhalation Risk Quotients for Non-carcinogenic Effects – Agricultural Receptors

| Chemical / Substance | Existing (2011) | Future (2031) without Project | Future (2031) with Project |
|------------------------------|-----------------|-------------------------------|----------------------------|
| NO ₂ | 2 | 1 | 0.5 |
| SO ₂ | 0.1 | 0.1 | 0.1 |

Notes: ¹ Combined annual RQ values for acetaldehyde, acrolein, formaldehyde, and naphthalene

4.3 Chronic Inhalation – Carcinogenic Effects

The risk characterization results for carcinogenic effects following chronic inhalation exposure to COPC defined as carcinogens were characterised for agricultural, residential and commercial receptors in **Table 20**. All of the maximum RQ values were well below 1.

Table 20 Chronic Inhalation Risk Quotients for Carcinogenic Effects

| Chemical | Agricultural Receptors | Residential Receptors | Commercial Receptors |
|----------------------------|------------------------|-----------------------|----------------------|
| Acetaldehyde | 0.003 | 0.006 | 0.00005 |
| Benzene | 0.03 | 0.05 | 0.0004 |
| DPM | 0.07 | 0.2 | 0.0008 |
| Benzo[a]pyrene | 0.04 | 0.08 | 0.0007 |
| 1,3-butadiene | 0.01 | 0.02 | 0.0002 |

| Naphthalene | 0.04 | 0.08 | 0.0007 |
| Leukemia ¹ | 0.1 | 0.2 | 0.002 |
| Lung tumours ² | 0.009 | 0.02 | 0.0002 |
| Nasal tumours ³ | 0.003 | 0.006 | 0.00005 |

Notes: ¹ Combined annual RQ values for 1,3-butadiene and benzene

² Combined annual RQ values for benzo[a]pyrene and DPM

³ Combined annual RQ values for acetaldehyde, formaldehyde, and naphthalene

5.0 Discussion

An analysis of the uncertainties associated with the quantification of health risks, the assumptions made to reduce these uncertainties, and the potential effect of these assumptions on the quantification of risk was conducted for the HHRA for air emissions. The results indicate that predicted exposures to chemicals in air emissions are at or below exposure limits associated with adverse health risks for the majority of the chemicals, exposure scenarios, and receptor locations considered. Notably, the lowest RQ values were determined for predicted future (2031) conditions with the Project, which indicates that the lowest risks to human health were associated with the emissions scenario where the Project is completed.

5.1 Uncertainty Analysis

The goal of the HHRA for air emissions was to evaluate the potential for adverse effects on human health as a result of changes in air quality that were attributable to the Project. This was a predictive analysis and relied on assumptions to estimate receptor exposure, including use of modelled air concentrations, assumptions of chemical fate and transport, and use of generic receptor characteristics to describe lifestyles and behaviours that affect exposure potential. Uncertainty associated with various assumptions about chemical toxicity was reduced by the use of exposure limits recommended by authoritative regulatory agencies, generally following substantial scientific and peer review. The exposure limits identified for the HHRA were the most stringent and defensible of those available from regulatory agencies. The key uncertainties associated with predicting human health risks and the conservative assumptions made to minimize those uncertainties are summarized in **Table 21**.

Table 21 Key Uncertainties and Assumptions in the Human Health Risk Assessment for Air Quality

| Uncertainty | Assumption | Effect |
|---|---|---|
| Project emission estimates and dispersion of emissions under various meteorological conditions. | Exposure to the maximum predicted air concentrations based on air dispersion modelling of emissions. | Exposure and potential health risks likely overestimated. |
| Highest predicted air concentration may not occur at a discrete receptor location. | Inclusion of the MPOI within Delta and Richmond, despite the unlikelihood that receptors would spend time at these locations. | Exposure and potential health risks likely overestimated. |
| Exposure concentrations. | <ul style="list-style-type: none"> • Acute exposure concentrations were based on <i>predicted</i> (modelled) plus maximum <i>measured</i> ambient 98th percentile 24-hour concentrations. It is likely that emission sources (vehicle exhaust) contributing to measured acute air concentrations, were included in modelled acute air concentrations (i.e., double counted). • Chronic exposure concentrations included the highest measured mean 24-hour concentrations (a conservative estimate of annual air concentrations). It is likely that emission sources for ambient and modelled concentrations were likely double counted. • Existing ambient air concentrations were assumed to continue under future exposure scenarios, despite the prediction that improvements in vehicle technology will improve future ambient air quality. | Exposure and potential health risks likely overestimated. |
| Exposure duration. | No attenuation of exposure assumed for agricultural and residential receptors; e.g., continuous exposure to outdoor air 24 hours/day, seven days/week, 52 weeks/year. | Exposure and potential health risks likely overestimated. |

| Uncertainty | Assumption | Effect |
|--|---|--|
| Chemical toxicity | <p>Evaluation of a range of exposure limits from several regulatory agencies and selection of the most defensible and protective limit for non-carcinogenic effects.</p> <p>The limits selected include safety factors that are applied to the observed effect/response levels lowered to account for sensitive individuals (e.g., those with compromised respiratory systems).</p> | <p>Chemical toxicity and potential health risks associated with non-carcinogens are not likely to be underestimated.</p> |
| | <p>Evaluation of a range of exposure limits from several regulatory agencies and selection of the most defensible and protective limit for carcinogenic effects.</p> <p>The limits selected are based on an incremental increase in lifetime lung cancer risk of one in 100,000, considered by Health Canada to be a negligible increase in cancer risk.</p> | <p>Cancer risks are not likely to be underestimated.</p> |
| <p>Potential interaction between chemicals that share a similar health effect endpoint</p> | <p>An additive interaction was assumed for chemicals with similar health endpoints, despite lack of scientific evidence for additive effects.</p> | <p>Chemical group toxicity and potential health risks are likely to be overestimated.</p> |

In summary, all assumptions made in the evaluation of potential human health risks are such that chemical exposures and chemical toxicity (individual and group) were likely overestimated. No adverse health effects are expected to occur where an RQ value equal to or below unity (i.e., ≤ 1) is determined. It can be further concluded with high certainty that adverse health effects would not be associated with RQ values slightly above unity (i.e., between 1 and 2) predicted for the MPOI locations or for chemical groups, considering the exposure and toxicity assumptions inherent to these RQ values were very conservative and likely overestimate potential risk.

5.2 Risk Characterization Results

5.2.1 Acute Exposure Conditions

The maximum acute RQ values determined under existing (2011) exposure conditions were below 1 for agricultural, residential, commercial and recreational receptor locations. At the locations of the highest predicted acute air concentrations within Delta and Richmond (i.e., MPOI), RQ values were predominately ≤ 1 . The exceptions were RQ values of 2 predicted for exposure to PM_{10} and assuming combined exposure to eye irritants (i.e., RQ values added for ammonia, acrolein, formaldehyde, and naphthalene). The locations of these MPOI are located in close proximity to the tunnel entrances from Delta and Richmond.

The maximum acute RQ values determined for future (2031) exposure conditions, with and without the Project, were below 1 for agricultural, residential, commercial, recreational and MPOI locations. The lowest acute RQ values were determined for predicted future (2031) conditions with the Project compared to existing (2011) conditions or future (2031) conditions without the Project.

5.2.2 Chronic Exposure Conditions

The maximum chronic RQ values determined under existing exposure conditions were below 1 for residential and commercial receptors. A maximum RQ value of 2 was determined for agricultural receptor exposure to NO_2 . A closer examination of the results indicated that RQ values for chronic exposure to NO_2 were less than 1 for the majority (16/17) of the agricultural receptor locations evaluated. The maximum RQ value was predicted for location #49, near the interchange between the Westminster Highway and Highway 99 (**Figure 2**).

The maximum chronic RQ values determined for future (2031) exposure conditions, with and without the Project, were below 1 at agricultural, residential, and commercial receptor locations. The lowest chronic RQ values were determined for predicted future (2031) conditions with the Project compared to existing (2011) conditions or future (2031) conditions without the Project.

All RQ values determined for incremental exposure to carcinogens as a result of the Project alone (i.e., Future with Project minus Future without Project) were <1 indicating a negligible increase in cancer risk (i.e., <1 in 100,000) as a result of exposure to carcinogenic chemicals in Project emissions. Further review of the predicted annual air concentrations for carcinogens under future conditions with the Project versus without the Project, indicated an overall decline in the annual air concentrations of the following carcinogens: acetaldehyde (20 receptor locations), benzene and B[a]P (19 receptor locations), DPM (38 receptor locations), 1,3-butadiene (18 receptor locations) and formaldehyde (23 receptor locations).

5.3 Summary

No adverse effects on human health are predicted as a result of Project emissions to air. All RQ values determined for the future with Project scenario were below 1 and predominately less than, sometimes equal to, RQ values predicted under existing conditions or future conditions without the Project. Air concentrations were predicted to improve under future conditions, both without and with the Project, as a result of improvements in vehicle technology (i.e., lower emissions). The lowest air concentrations were predicted for future conditions with the Project, as a result of better airflow and dispersion of vehicle emissions with the new bridge compared to the Tunnel.

1.0 Introduction

Hazard identification is the process in which the potential adverse health effects resulting from exposure to a chemical agent are determined. The outcome of this process is the identification of a safe exposure level at which adverse health effects are not predicted to occur, that is, an exposure limit. This appendix describes the exposure limits identified for the assessment of human health effects associated with exposure to chemicals identified in Project emissions. Exposure limits specific to acute and chronic inhalation were reviewed for all chemicals identified in Project emissions. Exposure limits specific to the ingestion (oral) pathway were reviewed for non-volatile chemicals (i.e., benzo[a]pyrene and formaldehyde). Oral exposure limits were also assumed for the assessment of dermal exposure as exposure limits specific to dermal contact were not available.

1.1 Exposure Limit Selection

The following profiles describe the recommended exposure limits for airborne chemicals of potential concern (COPC) that are predicted to be released from the Project. For each of the chemicals identified, the available exposure limits recommended by the following provincial, federal and international regulatory agencies were reviewed:

- Agency for Toxic Substances and Disease Registry (ATSDR)
- British Columbia Ministry of Environment (B.C. MOE)
- California Office of Environmental Health Hazard Assessment (OEHHA)
- Canadian Council of Ministers of the Environment (CCME)
- Health Canada
- Metro Vancouver (MV)
- Texas Commission on Environmental Quality (TCEQ)
- United States Environmental Protection Agency (US EPA)
- World Health Organization (WHO)
- Netherlands National Institute of Public Health and the Environment (RIVM)

The following attributes were reviewed and summarised for each exposure limit:

- Key toxicology (animal) or epidemiology (human) study
- Primary effect or chemical mode of action
- Point of departure (POD) or starting point for subsequent extrapolations and analyses (lowest Effect dose that is adequately supported by dose-response data)
- Dosimetric adjustments for animal to human exposures
- Uncertainty factors

In general, the most stringent of exposure limits recommended for COPC in Project emissions were used in the HHRA, which included uncertainty factors that further reduced the acceptable exposure limit for the protection of individuals who may be more sensitive to chemical exposure.

1.2 Chemical Grouping

The primary health effect associated with the exposure limit selected for each individual chemical was reviewed and chemicals with similar endpoints (i.e., respiratory irritation) were grouped together and assumed to act in an additive manner. **Table 1-1** summarises the chemical groups for acute and chronic inhalation effects for the COPC evaluated in the current assessment. No groups were identified for the oral/dermal exposure pathway as the health endpoints for these COPC were unique to each chemical.

Table 1-1 Chemical Mixtures

| Exposure Duration | Health Endpoint of Chemical Mixtures | COPCs in Chemical Mixtures |
|--------------------|--------------------------------------|---|
| Acute Inhalation | Eye irritation | Acrolein |
| | | Formaldehyde |
| | | Naphthalene |
| | Respiratory irritation | Acetaldehyde |
| | | Naphthalene |
| | | Nitrogen Dioxide |
| | | Sulphur Dioxide |
| Chronic Inhalation | Nasal irritation | Acetaldehyde |
| | | Acrolein |
| | | Formaldehyde |
| | | Naphthalene |
| | Nasal tumours | Acetaldehyde |
| | | Formaldehyde |
| | | Naphthalene |
| | Lung tumours | Diesel Particulate Matter Benzo[a]pyrene |
| | Leukemia | 1,3-Butadiene |
| | | Benzene |

2.0 Acetaldehyde

2.1 Inhalation Exposure Limits

2.1.1 Acute Inhalation

Table 2-1 presents the acute inhalation exposure limits for acetaldehyde.

- not available

The OEHHA (2014) recommend a 1-hour REL of $470 \mu\text{g}/\text{m}^3$ for acetaldehyde. This REL was derived from responses observed in asthmatic individuals following controlled, short-term (2-5 minutes) exposures to acetaldehyde (Prieto et al. 2000). A LOAEL of $142 \text{mg}/\text{m}^3$ for bronchoconstriction was identified from this study. The OEHHA (2008) applied a 300-fold uncertainty factor to this LOAEL account for use of a LOAEL (10), variability in human response ($\sqrt{10}$) and potential asthma exacerbation in children (10). This exposure limit was determined by the OEHHA (2008) to also be protective of potential eye irritation associated with acute exposure to acetaldehyde, following review of another controlled exposure study in humans (Silverman et al. 1946).

An 8-hour REL of $300 \mu\text{g}/\text{m}^3$ is also recommended for acetaldehyde by the OEHHA (2014). This REL was derived from a NOAEL of $270 \text{mg}/\text{m}^3$ for the degeneration of olfactory epithelium in rats intermittently exposed (6 hours/day, 5 days/week) to acetaldehyde over a 4 week period

(Appelman et al. 1982; 1986). The 8-hour REL was not considered for the acute exposure assessment as it was based on a subchronic exposure study and is intended for repeated 8-hour exposures.

The TCEQ (2014) recommend an acute (1-hour) ESL of 15 µg/m³ for acetaldehyde based on odour; no supporting documentation was provided for this ESL.

The OEHHA 1-hour REL of 470 µg/m³ was considered the most appropriate health-based guideline for the assessment of acute exposure to acetaldehyde as it was based on acute responses in humans and considered sensitive individuals. Although considered protective of eye and nasal irritation, the exposure limit was specific to respiratory irritation and therefore acetaldehyde was only included in the chemical group for respiratory irritation following acute inhalation exposures.

2.1.2 Chronic Inhalation

Table 2-2 presents the chronic inhalation exposure limits for acetaldehyde.

- not available

IARC (2014) has classified acetaldehyde as possibly carcinogenic to humans (Group 2B). Health Canada (2000), the OEHHA (2011) and US EPA (1991) have established chronic inhalation guidelines based on evidence in rats of an association between chronic inhalation exposure to acetaldehyde and nasal tumours (Woutersen et al. 1986; Woutersen and Appleman, 1984). These agencies also established guidelines based on nasal lesions in rats (Appelman et al. 1982; 1986) following acetaldehyde inhalation.

Health Canada (2000) developed a TC of $390 \mu\text{g}/\text{m}^3$ for the noncarcinogenic effects of acetaldehyde following chronic inhalation exposure. This guideline was based on the Appelman et al. (1982; 1986) inhalation studies reporting nasal lesions in rats intermittently exposed (6 hours/day, 5 days/week) to acetaldehyde over a 4 week period. The THRESH program (Howe 1995) was used to calculate a BMC_{05} of $218 \text{ mg}/\text{m}^3$ for non-neoplastic lesions in the nasal olfactory epithelium of male rats. The BMC_{05} was adjusted for continuous exposure (6h/24h, 5d/7d) and an uncertainty factor of 100 applied to account for extrapolation from an animal study (10) and variability in human response (10) (Health Canada 2000). An additional uncertainty factor to account for use of a short term study was not considered appropriate based on evidence that there was *no indication that severity of the critical effects increases with duration of exposure* (Health Canada 2000).

A TC_{05} of $86 \text{ mg}/\text{m}^3$ was also recommended by Health Canada (2000) based on the incidence of tumours in the nasal cavity of rats exposed to acetaldehyde for 6 hours/day, 5 days/week over 28 months (Woutersen et al., 1986). The TC_{05} was derived using multistage modeling and adjusted for continuous exposure (Health Canada 2000). The TC_{05} is associated with a 5% increase in tumour incidence over background. Dividing the TC_{05} by a factor of 5,000 results in an RsC of $17 \mu\text{g}/\text{m}^3$ for a 1 in 100,000 incremental cancer risk level.

The OEHHA (2014) recommends an REL of 140 $\mu\text{g}/\text{m}^3$ for the noncarcinogenic effects of acetaldehyde following chronic inhalation exposure. This REL was derived from the same rat inhalation studies (Appelman et al. 1982; 1986) identified for the 8-hour OEHHA REL. A study NOAEL of 270 mg/m^3 for degeneration of olfactory epithelium was identified. The OEHHA (2008) applied benchmark modelling (US EPA 2003) to determine a BMC_{05} of 178 mg/m^3 for the incidence of degeneration of olfactory epithelium. The BMC_{05} was converted to a human equivalent concentration of 242 mg/m^3 using a pharmacokinetic model specific to acetaldehyde (Teeguarden et al. 2008) and adjusted for continuous exposure to result in a $\text{BMC}_{05\text{HEC}}$ of 43.2 mg/m^3 . A cumulative uncertainty factor of 300 was applied to account for subchronic exposure ($\sqrt{10}$), extrapolation from an animal study ($\sqrt{10}$), variability in human response ($\sqrt{10}$) and potential asthma exacerbation in children (10) (OEHHA 2008).

A unit risk factor of 0.0000027 per $\mu\text{g}/\text{m}^3$ was recommended for acetaldehyde by the OEHHA (2011). Similar to Health Canada, this risk factor was calculated from the incidence of nasal tumours in rats (obligate nose breathers) following exposure to acetaldehyde for 6 hours/day, 5 days/week and up to 28 months (Woutersen et al. 1986). However, the OEHHA (2011) also applied an interspecies surface area correction factor (based on relative bodyweight) to account for potential exposure of the entire human respiratory tract, including the lung. The unit risk factor translates to an RsC of 3.7 $\mu\text{g}/\text{m}^3$, assuming an acceptable incremental cancer risk of 1 in 100,000.

The TCEQ (2014) recommends a chronic ESL of 45 $\mu\text{g}/\text{m}^3$ for acetaldehyde; however, no supporting documentation was provided for this exposure limit.

The US EPA (1991) recommends an RfC of 9 $\mu\text{g}/\text{m}^3$ for acetaldehyde based on noncarcinogenic effects following chronic exposure. A NOAEL of 273 mg/m^3 for degeneration of olfactory epithelium was identified from the Appelman et al. (1982; 1986) studies. The US EPA adjusted the NOAEL for continuous exposure and calculated a $\text{NOAEL}_{\text{HEC}}$ of 8.7 mg/m^3 for a gas:respiratory effect in the extra thoracic region. A 1,000-fold uncertainty factor was applied to the $\text{NOAEL}_{\text{HEC}}$ to account for use of a subchronic study (10), extrapolation from an animal study/incompleteness of the database (10) and variability in human response (10).

The US EPA (1991) recommends a unit risk factor of 0.0000022 per $\mu\text{g}/\text{m}^3$ for acetaldehyde. This risk factor was calculated from the incidence of nasal tumours in rats following exposure to acetaldehyde for 6 hours/day, 5 days/week for 27 months (Woutersen and Appleman 1984). The unit risk factor translates to an RsC of 5 $\mu\text{g}/\text{m}^3$ assuming a 1 in 100,000 incremental cancer risk.

The TC of 390 µg/m³ recommended by Health Canada was selected for the evaluation of noncarcinogenic effects following chronic inhalation exposure to acetaldehyde. The Health Canada TC was considered more appropriate than the exposure limits recommended by the US EPA and OEHHA as the TC was developed using benchmark modelling to determine a POD (unlike the US EPA) and the study on which all of these guidelines were based did not indicate that an additional safety factor for use of a subchronic study (as assigned by the US EPA and OEHHA) was warranted. Acetaldehyde was included in the chemical group for nasal irritation following chronic inhalation exposures.

The RsC of 3.7 µg/m³ (OEHHA) was selected for the assessment of carcinogenic effects following chronic inhalation exposure to acetaldehyde. Both the OEHHA and Health Canada selected results from the more recently published Woutersen et al. (1986) study for the determination of a unit risk factor. The OEHHA accounted for the fact that humans are not obligate nose breathers and adjusted the unit risk estimate to take into account the greater surface area of the human respiratory tract. Acetaldehyde was included in the chemical group for nasal tumours following chronic inhalation exposures.

- not available

The ATSDR (2013), OEHHA (2014) and TCEQ (2014) all recommend 1-hour exposure limits for acrolein based on eye, nasal and respiratory irritation reported in controlled human exposure studies (Weber-Tschopp et al. 1977; Darley et al. 1960). The US EPA do not recommend an acute exposure limit for acrolein but cites the clinical study by Weber-Tschopp et al. (1977) as the most comprehensive for describing the acute effects of acrolein inhalation in humans (US EPA 2003a).

The ATSDR (2013) 1-hour MRL for acrolein is $7 \mu\text{g}/\text{m}^3$. The MRL was based on a LOAEL of 0.3 ppm ($700 \text{ mg}/\text{m}^3$) for decreased respiratory rate as well as nose and throat irritation in human volunteers exposed to acrolein for 60 minutes (Weber-Tschopp et al. 1977). An uncertainty factor of 100 was applied to the LOAEL to account for use of a LOAEL (10) and variation in human response (10) (ATSDR 2007).

The OEHHA (2014) recommend a 1-hour REL of $2.5 \mu\text{g}/\text{m}^3$ for acrolein. The OEHHA (2008) identified a LOAEL of 0.06 ppm ($140 \mu\text{g}/\text{m}^3$) for eye irritation in human volunteers following short-term (5-minutes) exposure to acrolein (Darley et al. 1960). Ocular irritation was first reported by Weber-Tschopp et al. (1977) during 40 minutes exposure to increasing concentrations of acrolein at a similar LOAEL (0.07 ppm or $160 \mu\text{g}/\text{m}^3$). Acute REL values of 2.3 and $2.7 \mu\text{g}/\text{m}^3$ were determined for each study LOAEL after an uncertainty factor of 60 was applied to account for use of a LOAEL for a mild effect (6) and variation in human response (10). No time adjustment was made to the RELs as the critical effect was a sensory irritancy effect. The geometric mean of the REL values from these studies (i.e., $2.5 \mu\text{g}/\text{m}^3$) was selected as the 1-hour REL for acrolein (OEHHA 2008).

An 8-hour REL of $0.7 \mu\text{g}/\text{m}^3$ was also recommended for acrolein by the OEHHA (2014). This REL was based on a subchronic study where a NOAEL of 0.2 ppm ($465 \mu\text{g}/\text{m}^3$) was identified for lesions in the respiratory epithelium of rats exposed to acrolein 6 hours/day, 5 days/week over 65 days (Dorman et al. 2008). The 8-hour REL for acrolein was not considered for the acute exposure assessment as it was based on subchronic exposure data in animals and is intended for repeated 8-hour exposures.

An acute ReV of $11 \mu\text{g}/\text{m}^3$ is recommended for acrolein by the TCEQ (2014). Similar to the ATSDR (2007), the TCEQ (2010) identified a LOAEL of 0.3 ppm ($700 \text{ mg}/\text{m}^3$) for eye, nose, throat irritation and decreased respiratory rate in human volunteers exposed for 60 minutes to acrolein (Weber-Tschopp et al. 1977). An uncertainty factor of 63 was applied to the LOAEL to account for use of a LOAEL (6.3) and variation in human response (10) (TCEQ 2010).

The 1-hour exposure limit of 2.5 µg/m³ (OEHHA, 2008) was selected for the assessment of acute exposure to acrolein as it was based on the most sensitive human response (eye irritation) to acute acrolein exposure and supported by more than 1 study. This acute exposure limit for acrolein is considered very conservative. As described below, the limit identified for chronic exposure to acrolein, based on nasal lesions, is very similar to this 1-hour exposure limit. Although protective of nasal and respiratory irritation, the 1-hour exposure limit was specific to eye irritation and therefore acrolein was only included in the chemical group for eye irritation following acute inhalation exposures.

3.1.2 Chronic Inhalation

Table 3-2 presents the chronic inhalation exposure limits for acrolein.

Health Canada (2000) recommends a TC of $0.4 \mu\text{g}/\text{m}^3$ for chronic exposure to acrolein. The THRESH program (Howe 1995) was used to calculate a BMC_{05} of $0.14 \text{ mg}/\text{m}^3$, the air concentration representing a 5% increase in the incidence of nasal lesions in rats following inhalation (nose-only) exposure to acrolein for 6 hours/day over a 3 day period (Cassee et al. 1996). The BMC_{05} was adjusted for continuous exposure and an uncertainty factor of 100 applied to account for use of an animal study (10) and variability in human response (10). No uncertainty factor was applied for less than chronic exposure.

Health Canada (2000) noted the degenerative changes observed by Cassee et al. (1996) following short-term exposures were consistent with observations in longer term bioassays in rats (Feron et al. 1978) and hamsters (Feron and Krusysse, 1977).

The OEHHA (2014) recommend a chronic REL of $0.35 \mu\text{g}/\text{m}^3$ for acrolein. Similar to the 8-hour REL, the chronic REL was based on a NOAEL of 0.2 ppm ($465 \mu\text{g}/\text{m}^3$) for lesions in the respiratory epithelium of rats exposed to acrolein 6 hours/day, 5 days/week for 13 weeks (Dorman et al. 2008). The OEHHA (2008) calculated a $\text{NOAEL}_{\text{HEC}}$ of 0.03 ppm ($70 \mu\text{g}/\text{m}^3$) after adjusting the NOAEL for continuous exposure and applying a dosimetric adjustment factor (DAF) of 0.85 based on comparative modeling of gas flux in human and rat nasal passages with formaldehyde. An uncertainty factor of 200 was applied to account for extrapolation from an animal study ($\sqrt{10}$), use of a subchronic study ($\sqrt{10}$), variability in human response (10) and use of a DAF for formaldehyde, an analogue chemical, to determine the human exposure concentration for acrolein (2).

The TCEQ (2014) recommend an ReV of $2.7 \mu\text{g}/\text{m}^3$ for chronic exposure to acrolein. Similar to the OEHHA (2008), this guideline was based on a NOAEL of 0.2 ppm ($465 \mu\text{g}/\text{m}^3$) for hyperplasia of the respiratory epithelium of rats exposed to acrolein 6 hours/day, 5 days/week for 13 weeks (Dorman et al. 2008). The study investigated duration and concentration effects for several exposure groups and evaluated the histopathology and recovery of the respiratory tract post-exposure. The TCEQ (2014) calculated a $\text{NOAEL}_{\text{HEC}}$ of 35.7 ppb ($83 \mu\text{g}/\text{m}^3$) for acrolein after adjusting the NOAEL for continuous exposure. An uncertainty factor of 30 was applied to the $\text{NOAEL}_{\text{HEC}}$ account for extrapolation from an animal study (3) and variability in human response (10). No adjustment was made for use of a subchronic response as the TCEQ (2014) concluded that concentration played more of a role in the irritant effects of acrolein than duration of exposure. Unlike the OEHHA, the TCEQ (2014) did not consider the use of a DAF based on formaldehyde appropriate for acrolein due to differences in nasal dosimetry patterns for acrolein and formaldehyde and did not apply an additional 2-fold uncertainty factor for use of a DAF.

The US EPA (2003b) recommends an RfC of 0.02 $\mu\text{g}/\text{m}^3$ for acrolein based on a LOAEL of 0.9 mg/m^3 for nasal lesions in rats exposed to acrolein for 5 days/week over 13 days (Feron et al. 1978). The US EPA calculated a LOAEL (HEC) of 0.02 mg/m^3 after adjusting for continuous exposure and applied a 1000-fold uncertainty factor to account for use of a minimal LOAEL (3), use of a subchronic study (10), extrapolation from an animal study (3) and variability in human response (10). The US EPA selected the Feron et al. (1978) study over the Cassee et al. (1996) selected by Health Canada, based on the reporting of results for a higher number of test animals (including both sexes of rats, hamsters, and rabbits), a longer exposure duration, and better characterization of multiple endpoints and the dose-response by Feron et al. (1978).

The US EPA (2003b) recommended the lowest chronic inhalation guideline for acrolein; however, this guideline was based on an older study which identified a LOAEL which required a higher uncertainty factor. The OEHHA and TCEQ identified guidelines for acrolein based on the most recent study for nasal irritation in rats which identified a NOAEL for nasal lesions (Dorman et al. 2008); however, the OEHHA REL included use of a DAF that is not considered relevant to acrolein (TCEQ 2014). Therefore, the ReV of 2.7 $\mu\text{g}/\text{m}^3$ recommended by the TCEQ (2014) was considered the most appropriate for the assessment of chronic inhalation exposure to acrolein. Acrolein was included in the chemical group for nasal irritation following chronic inhalation exposures.

| B.C. MOE | - | - | - | - | - | B.C. MOE 2013 |
| METRO VANCOUVER | - | - | - | - | - | MV 2011 |
| OEHHA | 1-hour REL | 3,200 | Eye and respiratory irritation | Human | Industrial Biotest Laboratories 1973; MacEwan et al 1970; Silverman et al 1949; Verberk 1977 | OEHHA 1999 |
| TCEQ | 1-hour ReV | 590 | Eye and respiratory irritation | Human | Sundblad et al. 2004 | TCEQ 2014 |

The ATSDR (2004) established an acute MRL of 1,200 $\mu\text{g}/\text{m}^3$ (1.7 ppm) for ammonia. The MRL was based on a LOAEL of 50 ppm (35 mg/m^3) for mild irritation to the eye, nose, and throat and cough in human volunteers acutely exposed to ammonia gas (50, 80, 110, or 140 ppm) (Verberk et al. 1977). An uncertainty factor of 30 was applied to the LOAEL to account for use of a LOAEL (3) and variation in human response (10) (ATSDR 2004).

The OEHHA (1999) recommend a 1-hour REL of 3,200 µg/m³ (4.5 ppm) for ammonia. Eye and respiratory irritation effects were reported by human volunteers following acute exposures to various concentrations of ammonia (ranging from 30 to 500 ppm) in four studies (Industrial Biotest Laboratories, 1973; MacEwen et al., 1970; Silverman et al., 1949; Verberk, 1977). The acute REL is based on a benchmark concentration of 13.6 ppm representing a 5% response rate (BC₀₅) to 1-hour ammonia exposures, derived from the four studies using a log-normal probit analysis, plus an uncertainty factor of 3 to account for variation in human response (OEHHA 1999).

An acute ReV of 590 µg/m³ (0.83 ppm) is proposed for ammonia by the TCEQ (2014). This ReV is based on a study of human volunteers exposed to 5 or 25 ppm ammonia for 3 hours, during which volunteers alternated every 30 minutes between rest and activity (bicycle) (Sundblad et al. 2004). No treatment related effects on lung function, bronchial responsiveness or pulmonary inflammation response were observed. The lowest exposure dose (5 ppm) was associated with temporary symptoms of eye discomfort, headache, dizziness, and feelings of intoxication and was identified as a LOAEL for the acute ReV. An uncertainty factor of 6 was applied to the LOAEL to account for variation in human response (TCEQ 2014).

The 1-hour ReV of 590 µg/m³ (TCEQ 2014) was selected for the assessment of acute exposure to ammonia as it is based on a recent, well conducted study that evaluated the effects of ammonia at the lowest exposure concentrations. Ammonia was included in the chemical groups for eye irritation and respiratory irritation following acute inhalation exposures.

4.1.2 Chronic Inhalation

The ASTDR (2004), OEHHA (2000), TCEQ (2014) and US EPA (1991) all identified a study by Holness et al (1989) for the development of their chronic inhalation exposure limits for ammonia. This study examined the effects of chronic occupational exposure to ammonia in a soda ash plant on worker lung function and respiratory symptoms.

The ATSDR (2004) recommend a chronic MRL of $70 \mu\text{g}/\text{m}^3$ (0.1 ppm) for ammonia. A mean time-weighted-average exposure concentration of 9.2 ppm was identified as a NOAEL for significant changes in lung function parameters in workers exposed to ammonia for an average of 12.2 years in a soda ash plant (Holness et al. 1989). This NOAEL was adjusted for continuous exposure (8/24 hours x 5/7 days) and an uncertainty factor of 30 was applied to account for variation in human response (10) and a lack of reproductive and developmental studies of chronic exposure to ammonia (3) (ATSDR 2004).

The OEHHA (2000) identified the same air concentration 9.2 ppm from Holness et al (1989) as a NOAEL for pulmonary function following chronic exposure to ammonia. The NOAEL was adjusted for continuous exposure (i.e., $10 \text{ m}^3/20 \text{ m}^3$ x 5/7 days). An uncertainty factor of 10 was applied to the NOAEL to account for variation in human response, resulting in a chronic REL of $200 \mu\text{g}/\text{m}^3$ (0.3 ppm) (OEHHA 2000).

The TCEQ (2014) recommend an ReV of 320 $\mu\text{g}/\text{m}^3$ (0.45 ppm) for chronic exposure to ammonia. The TCEQ identified a higher NOAEL of 12.5 ppm (8.8 mg/m^3) from the Holness et al (1989) study, corresponding to the highest worker exposure group. This air concentration was selected as a NOAEL due to the absence of self-reported symptoms or effects on measured lung function parameters in workers highly exposed to ammonia. The NOAEL was adjusted for continuous inhalation exposure (i.e., 10 $\text{m}^3/20 \text{m}^3 \times 5/7$ days); an uncertainty factor of 10 was applied to account for variation in human response (TCEQ 2014).

The US EPA (1991) currently recommends an RfC of 100 $\mu\text{g}/\text{m}^3$ for ammonia. This chronic exposure limit is based on a NOAEL of 9.2 ppm (6.4 mg/m^3) or the mean time-weighted-average exposure concentration for the absence of respiratory effects in workers exposed to ammonia 5 days/week over 12.2 years (Holness et al. 1989). The US EPA adjusted the NOAEL for continuous inhalation exposure (i.e., 10 $\text{m}^3/20 \text{m}^3 \times 5/7$ days) and applied an uncertainty factor of 30 to account for sensitive individuals and database deficiencies.

Ammonia is currently under re-assessment by the US EPA and an RfC of 300 $\mu\text{g}/\text{m}^3$ is being proposed (US EPA 2012). This reassessment identified a higher NOAEL of 8.8 mg/m^3 for chronic inhalation exposure to ammonia, corresponding to the highest reported exposure concentration associated with no adverse effects on lung function from the Holness et al (1989) study. The NOAEL was adjusted to account for non-continuous, occupational exposure (i.e., 10/20 $\text{m}^3 \times 5/7$ days) and an uncertainty factor of 10 was applied for potentially sensitive individuals.

All of the agencies established exposure limits for ammonia based on the Holness et al (1989) occupational study. The OEHHA (2000) guideline of 200 $\mu\text{g}/\text{m}^3$ for changes in lung function was selected for the current assessment of chronic inhalation exposure to ammonia, in recognition that an uncertainty factor for database deficiencies is lacking in recent exposure limit development. This exposure limit is considered conservative as the TCEQ has considered and the US EPA is currently considering, a higher NOAEL for ammonia.

The ATSDR recommend an acute (24-hour) MRL of $30 \mu\text{g}/\text{m}^3$ for benzene (ATSDR 2013). This MRL is based on an observed decrease in mitogen-induced lymphocyte proliferation following the exposure of mice to benzene vapours for 6 hours per day over a 6 day period (Rozen et al 1984). The study LOAEL of 10.2 ppm ($33 \text{ mg}/\text{m}^3$) was adjusted from intermittent to 24-hour exposure and converted to an human equivalent concentration (HEC) of 2.55 ppm ($8 \text{ mg}/\text{m}^3$) using US EPA (1994) methodology for the extrarrespiratory effects of a category 3 gas. The 24-hour LOAEL_{HEC} was divided by a 300-fold uncertainty factor to account for use of a LOAEL (10), extrapolation from animals (3) to humans and human variability (10) (ATSDR 2007).

The OEHHA (2014a) recommend an acute REL of 1,300 for 6-hour exposure to benzene. This REL was derived from a study of developmental toxicity in rats conducted by Coate et al. (1984). The study addressed the most sensitive noncancer endpoint associated with benzene inhalation which was lowered fetal body weights in offspring following dam exposure for 6 hours/day on gestational days 6 to 15 (OEHHA 1999a). It is noted the OEHHA reference exposure levels for benzene are currently under review and a 1-hour REL based on haematological effects in mice (Keller and Snyder et al. 1988) is being proposed (OEHHA 2014b).

The TCEQ (2007) developed a 1-hour ReV of 580 $\mu\text{g}/\text{m}^3$ for benzene using the same study and LOAEL identified by the ATSDR. The hematotoxic effects observed in the Rozen et al. 1984 study were supported by two additional studies in mice (Dempster and Snyder 1991; Corti and Snyder, 1996). The TCEQ (2007) converted the LOAEL of 10.2 ppm (33 mg/m^3) to a 1-hour HEC of 18.5 ppm (59 mg/m^3) which was then divided by a 100-fold uncertainty factor to account for use of a LOAEL (3), extrapolation from animals to humans (3) and human variability (10).

The US EPA do not recommend an acute exposure limit for benzene but do cite a variety of animal studies examining the acute effects of benzene inhalation which confirm that acute exposure to high benzene concentrations results in hematotoxic effects with a greater sensitivity observed in mice over rats (US EPA 2002).

The TCEQ 1-hour ReV of 580 $\mu\text{g}/\text{m}^3$ was selected for the current assessment of acute exposure to benzene as the effect of benzene on lymphocyte response in mice was supported by several studies and the 1-hour exposure duration selected by the TCEQ was considered the most appropriate for the response observed.

5.1.2 Chronic Inhalation

Table 5-2 presents the chronic inhalation exposure limits for benzene.

IARC (2014) has classified benzene as carcinogenic to humans (Group 1). With the exception of ATSDR, all the regulatory agencies reviewed have established chronic inhalation guidelines based on epidemiological evidence of an association between chronic occupational exposure to benzene and leukemia mortality rates. The ATSDR, OEHHA, TCEQ and US EPA have also established chronic inhalation guidelines based on haematological/immunological effects (i.e., lymphocyte response).

The ATSDR (2013) recommend a chronic MRL of $9.8 \mu\text{g}/\text{m}^3$ for benzene. The MRL was derived from a study of workers in Chinese shoe manufacturing industries (Lan et al 2004) which reported an exposure-response relationship between benzene exposure levels (measured by individual vapour monitors) and decreased lymphocyte (B cell) count in workers exposed an average of 6.1 years (ATSDR 2007). A $\text{BMCL}_{0.25\text{sd}}$ of 0.10 ppm ($0.33 \text{ mg}/\text{m}^3$), representing the lower 95% confidence limit for a 0.25 standard deviation reduction below the control mean B cell count, was identified as the point of departure (POD) for the chronic MRL. The $\text{BMCL}_{0.25\text{sd}}$ was adjusted for continuous exposure and an uncertainty factor of 10 applied for human variability to result in a chronic MRL of 0.003 ppm ($0.0098 \text{ mg}/\text{m}^3$).

Health Canada (2010) derived a TC_{05} of $15 \text{ mg}/\text{m}^3$ for benzene based on the incidence of mortality from leukemia in a cohort of rubber hydrochloride (pliofilm workers) (Rinsky et al. 1987). The exposure concentration associated with a 5% increase in mortality from acute myelogenous leukemia (TC_{05}) was derived using cancer potencies based on exposure estimates of Crump and Allen (1984) as described in Health Canada (1993). When divided by 5,000 the TC_{05} translates to an RsC of $3 \mu\text{g}/\text{m}^3$ for a 1 in 100,000 incremental increase in mortality from acute myelogenous leukemia.

An REL of $60 \mu\text{g}/\text{m}^3$ was derived by OEHHA (2014a) for chronic exposure to benzene. This REL was based on haematological effects following occupational exposure of a cohort of 454 male petroleum refinery workers exposed to benzene (personal monitors) over an average for 7.4 years (Tsai et al. 1983). Again, the OEHHA reference exposure levels for benzene are currently under review and a chronic REL based on haematological effects in Chinese shoe workers (Lan et al 2004), is being proposed (OEHHA 2014b).

The OEHHA (2011) also recommend a unit risk factor of 0.000029 per $\mu\text{g}/\text{m}^3$ for benzene based on mortality from leukemia in pliofilm workers as reported by Rinsky et al (1981) using a weighted cumulative exposure/relative risk procedure by CDHS (1984). This unit risk factor translates to a RsC of $0.3 \mu\text{g}/\text{m}^3$ for a 1 in 100,000 incremental increase in mortality from leukemia.

The RIVM (2001) has established a CR of $20 \mu\text{g}/\text{m}^3$ for benzene assuming an excess cancer risk of 1 in 10,000. This was divided by 10-fold to determine an air concentration of $2 \mu\text{g}/\text{m}^3$ for an excess cancer (leukemia) risk of 1 in 100,000 for comparison with other agencies. The RIVM (2001) adopted the lower limit of the EU (1999) cancer risk estimates for chronic exposure to benzene, which is equivalent to the unit risk recommended by the WHO (2000).

An ReV of $280 \mu\text{g}/\text{m}^3$ is recommended for benzene by the TECQ (2007). This guideline is based on hematotoxic effects (reduced lymphocyte count) in Chinese workers occupationally exposed to benzene for an average of 6.3 years (Rothman et al 1996). The critical effect of decreased lymphocyte count is supported by the results of Lan et al (2004) for workers in Chinese shoe manufacturing industries exposed to benzene for an average of 6.1 years (TCEQ 2007). The TCEQ (2007) derived a benchmark concentration (BMC) of $8.4 \text{mg}/\text{m}^3$ (adjusted for continuous exposure) from the Rothman et al (1996) study to which an uncertainty factor of 30 was applied to account for human variability (10) and a lack of data for reproductive/developmental effects (3).

The TCEQ (2007) also recommend a chronic ESL ($^{\text{chronic}}\text{ESL}_{\text{linear(c)}}$) of $4.5 \mu\text{g}/\text{m}^3$ for an excess lifetime cancer risk of 1 in 100,000 following chronic exposure to benzene. This air concentration was derived using the cancer potency estimates of Crump and Allen (1994) for acute myelogenous leukemia in the pliofilm cohort described by Rinsky et al. (1981; 1987).

The US EPA (2003) recommends a RfC of $30 \mu\text{g}/\text{m}^3$ for benzene. This RfC was based on the effect of reduced absolute lymphocyte count in Chinese workers reported in the Rothman et al (1996) study. A BMC of $8.2 \text{mg}/\text{m}^3$ was calculated and adjusted by an uncertainty factor of 300 to account for human variability (10), extrapolating from a LOAEL to a NOAEL (3), extrapolating from subchronic to chronic exposure (3) and database uncertainties (3) (US EPA 2002).

The US EPA (2000) also recommends unit risk factors for benzene based on the incidence of acute myelogenous leukemia reported in workers exposed to benzene. Air concentrations recommended for benzene at a 1 in 100,000 cancer risk level range from 1.3 to $4.5 \mu\text{g}/\text{m}^3$ and were determined from the pliofilm cohort described by Rinsky et al. (1981; 1987) using risk calculations recommended by Paustenbach et al. (1993); Crump and Allen (1984); Crump (1994) and U.S. EPA (1998).

The WHO (2001) recommend an air quality of guideline of $1.7 \mu\text{g}/\text{m}^3$ for an excess lifetime cancer (leukemia) risk of 1 in 100,000 following chronic exposure to benzene. This guideline was derived from a range of studies reporting risk estimates for mortality from leukemia in the pliofilm cohort of workers (Crump and Allen, 1984; Rinsky et al. 1987; Paustenbach et al. 1992).

The lowest air concentration recommended by the ATSDR (2007) for haematological/immunological effects ($9.8 \mu\text{g}/\text{m}^3$) was selected for the assessment of non-carcinogenic effects following chronic inhalation exposure to benzene.

The range of air concentrations identified by the US EPA (2003) for a 1 in 100,000 cancer risk level is supported by similar exposure limits derived by Health Canada, RIVM, TCEQ and WHO for the same response (i.e., leukemia). An important distinction of the Health Canada guideline was the identification of the exposure concentration associated with mortality from, rather than incidence of, leukemia. For the purpose of this assessment, the lowest air concentration recommended by the US EPA ($1.3 \mu\text{g}/\text{m}^3$) was selected for the evaluation of potential carcinogenic effects following chronic inhalation exposure to benzene. Benzene was included in the chemical group for leukemia following chronic inhalation exposures.

6.0 Benzo[a]pyrene

6.1 Inhalation Exposure Limits

6.1.1 Acute Inhalation

IARC (2014) has classified benzo[a]pyrene (B[a]P) as carcinogenic to humans (Group 1). Studies on the carcinogenic potential of B[a]P and mixtures of polycyclic aromatic hydrocarbons (PAHs) following chronic inhalation or oral exposures are outlined in ATSDR (1995); Health Canada (2010); RIVM (2001); and US EPA (1994).

The effects of acute inhalation exposure to B[a]P have not been characterized and no acute exposure limits with supporting documentation were identified (**Table 6-1**). As a C20 aromatic hydrocarbon B[a]P has extremely low volatility and inhalation of the chemical in isolation from particulate matter is unlikely. Controlled inhalation and intratracheal instillation studies in animals have demonstrated the carcinogenicity of B[a]P over long-term (chronic) exposure periods as described below.

Table 6-1 Acute Inhalation Exposure Limits for B[a]P

| Agency | Exposure Limit Type | Exposure Limit Value ($\mu\text{g}/\text{m}^3$) | Critical Organ or Effect | Species | Study | Source |

Health Canada (2010) developed a unit risk factor of 0.031 per $\mu\text{g}/\text{m}^3$ for B[a]P. This unit risk factor was determined using multistage modeling of the tumour incidence in the respiratory tract of hamsters exposed by inhalation (nose only) to B[a]P for 4.5 hours/day, 7 days/week during the first 10 weeks of the study and 3 hours/day, 7 days/week for the remainder of the study (up to 96 weeks) (Thyssen et al. 1981). This unit risk factor translates to an RsC of 0.32 $\mu\text{g}/\text{m}^3$ based on a 1 in 100,000 excess lifetime cancer risk.

A unit risk factor of 0.0011 per $\mu\text{g}/\text{m}^3$ was derived for B[a]P by the OEHHA (2011). Similar to Health Canada, the linearized multistage model was fit to respiratory tract tumour data in hamsters as reported by Thyssen et al. (1981). The OEHHA (2011) further calculated an oral risk factor (0.43 per mg/kg body weight/day) based on the exposure conditions described in the study and the inhalation rate and body weight of hamsters. A human equivalent unit risk factor for the inhalation pathway was then determined by applying an interspecies surface area correction factor, based on bodyweight and surface area, to the oral risk factor. The resulting OEHHA (2011) unit risk factor corresponds to an RsC of 0.009 $\mu\text{g}/\text{m}^3$ for a 1 in 100,000 excess lifetime cancer risk. It is noted that while the bodyweight scaling approach selected by the OEHHA (2011) is consistent with US EPA (2005) cancer risk assessment guidance for oral exposures, the EPA does not recommend this approach for determining human equivalent exposures for the inhalation pathway.

The US EPA (1994) does not currently recommend an inhalation unit risk estimate for B[a]P; however, the potential inhalation toxicity of B[a]P is currently under review by the US EPA with a draft human health assessment released August 2013 for independent peer review and public comment (US EPA 2013).

The WHO (1987; 2000) selected B[a]P as an indicator of the carcinogenic potential of PAH mixtures in air and developed a unit risk factor of 0.0087 per $\mu\text{g}/\text{m}^3$ using a linearized multistage model and epidemiological data for mortality due to lung cancer in workers exposed to mixtures of PAH in coke-oven emissions (Redmond 1976; US EPA 1984). Using this unit risk factor, a B[a]P air concentration of 0.00012 $\mu\text{g}/\text{m}^3$ would be associated with a 1 in 100,000 increased risk of mortality as a result of lung cancer. The WHO (1987; 2000) guideline for B[a]P represents an index of PAH mixtures from coke oven emissions and similar combustion processes. The WHO (2000) noted that although the PAH composition in coke-oven emissions may not correlate to PAH in ambient air, epidemiological studies involving other PAH mixtures have determined similar cancer risks and a unit risk within the same order of magnitude was determined for B[a]P from animal data (i.e., Heinrich et. al 1994).

The WHO (2000) guideline for B[a]P was considered the most appropriate for the assessment of a mixture of carcinogenic PAH in Project emissions. B[a]P was included in the chemical group for lung tumours following chronic inhalation exposures.

The OEHHA (2014), TCEQ (2008) and US EPA (2002) have all developed acute inhalation exposure guidelines for 1,3-butadiene based on a study of developmental toxicity in mice (Hackett et al., 1987). Hackett et al. (1987) examined the reproductive and developmental effects of 1,3-butadiene on pregnant CD-1 mice and their offspring. The mice were exposed via inhalation to 0, 40 ppm (88.4 mg/m^3), 200 ppm (442 mg/m^3) or 1,000 ppm (2,210 mg/m^3) 1,3-butadiene for 6 hours/day on gestational days 6 to 15 and sacrificed on gestational day 18 (Hackett et al., 1987).

The OEHHA (2013) 1-hour REL of $660 \mu\text{g}/\text{m}^3$ (0.297 ppm) was based on lowered fetal body weights in male offspring following dam exposure for 6 hours/day on gestational days 6 to 15 (Hackett et al. 1987). A BMCL_{05} of 17.7 ppm was identified for lowered male fetal weights using values reported by Green (2003) following a re-analysis of the Hackett et al. (1987) data. A dosimetric adjustment factor was used to calculate an HEC of 29.7 ppm ($65.6 \text{ mg}/\text{m}^3$) to which an uncertainty factor of 100 was applied to account for use of an animal study (3) and variability in human response (30) (OEHHA 2013).

The OEHHA (2013) also developed an 8-hour limit of $9 \mu\text{g}/\text{m}^3$ (0.0042 ppm) for 1,3 butadiene based on a chronic NTP (1993) bioassay study that reported ovarian atrophy in female mice exposed via inhalation for 6 h/day, 5 d/wk over 103 weeks. This guideline was not selected for the current assessment of acute inhalation exposure as it was based on a response to chronic inhalation exposure and is intended for repeated 8-hour exposures.

The US EPA (2002) subchronic RfC of $15 \mu\text{g}/\text{m}^3$ (0.007 ppm) was also based on decreased fetal bodyweights in mice (Hackett et al. 1987). The US EPA (2002) used benchmark modeling to identify an LEC_{05} of 2.9 ppm ($6.4 \text{ mg}/\text{m}^3$) for a 24-hour exposure period and applied an uncertainty factor of 400 to account for extrapolation from an animal study (3), variability in human response (10), use of a lowest effect level (4) and database deficiencies (3).

The TCEQ (2008) 6-hour ReV of $3,700 \mu\text{g}/\text{m}^3$ (1.7 ppm) was based on the maternal toxicity of 1,3 butadiene in mice (Hackett et al. 1987). A BMCL_1 of 51.3 ppm ($113.4 \text{ mg}/\text{m}^3$) was determined for decreased maternal extragestational weight gain as a result of daily 6 hour exposures on gestational days 6 to 15. An uncertainty factor of 30 was applied to account for use of an animal study (3) and variability in human response (10).

The REL of $660 \mu\text{g}/\text{m}^3$ recently developed by OEHHA (2014) using a re-analysis of the Hackett et al. (1987) data was selected for the assessment of 1-hour exposures to 1,3-butadiene. The lowest guideline of $15 \mu\text{g}/\text{m}^3$ recommended by the US EPA was also selected for assessment of 24-hour exposures to 1,3-butadiene. Use of these two guidelines in the acute inhalation assessment was considered protective of 6-hour exposures to 1,3-butadiene.

It is noted that the limited data available suggests that mice are more sensitive to the developmental effects of butadiene compared to rats or humans due to a greater rate of metabolism of butadiene to the reactive metabolites responsible for butadiene toxicity (OEHHA 2013; ATSDR 2012; TCEQ 2008)). The ATSDR has not developed an acute inhalation exposure limit for 1,3-butadiene due to the lack of available data to account for the significant differences in the metabolism of 1,3-butadiene between species and the concern that exposure limits based on responses observed in mice may overestimate the potential risks to human health (ATSDR 2012).

1,3-Butadiene has been classified as carcinogenic to humans (Group 1) by the International Agency for Research on Cancer (IARC 2008; 2013). An increased incidence of leukemia in

workers exposed to 1,3-butadiene in styrene butadiene rubber plants has been reported by Delzell et al. (1995). Health Canada (2000), the RIVM (2009), TCEQ (2008) and US EPA (2002) have all considered the results of this occupational study in the development of chronic inhalation exposure limits. The OEHHA (2011) developed a chronic inhalation exposure limit for 1,3-butadiene based on the occurrence of lung tumours in mice as reported by Melnick et al. (1990).

Health Canada (2000) compiled exposure-response data for workers from 6 styrene butadiene rubber plants (Delzell et al. 1995) and used regression analyses to identify a butadiene concentration of 1.7 mg/m^3 associated with a 1% (0.01) excess probability of mortality as a result of leukemia (TC_{01}). By extrapolation the air concentration associated with a 1 in 100,000 or 0.00001 leukemia mortality risk would be $1.7 \text{ } \mu\text{g/m}^3$.

The US EPA (2002) considered the Health Canada (2000) analyses of the Delzell et al (1995) data as well as age-specific data on leukemia incidence rates for 1994-1998 from SEER (Surveillance, Epidemiology and End Results) program of the National Cancer Institute to estimate the incidence of (rather than mortality from) leukemia as a result of chronic inhalation exposure to butadiene. An inhalation unit risk of $0.3 \text{ } \mu\text{g/m}^3$ at the 1 in 100,000 risk level was recommended by the US EPA (2002) for chronic exposure to butadiene. This RsC was adopted by RIVM as the chronic inhalation limit value for the evaluation of 1,3-butadiene in air (2009).

The TCEQ (2008) have recommended a risk specific concentration of $20 \text{ } \mu\text{g/m}^3$ for 1 in 100,000 (1×10^{-5}) excess cancer risk associated with chronic inhalation of butadiene. This exposure limit was also based on the Delzell et. al. (1995) study but incorporated exposure estimates, epidemiological studies and dose-response modeling not available at the time of the Health Canada and US EPA assessments. Relative risks were determined using Texas specific rates of leukemia mortality and survival for up to 70 years exposure, whereas the US EPA considered 85 years exposure (TERA 2010).

The OEHHA (2011) recommended a risk specific concentration of $0.06 \text{ } \mu\text{g/m}^3$ at the 1×10^{-5} excess cancer risk for butadiene. In contrast to Health Canada, the OEHHA (2011) considered the available epidemiological data to be insufficient for unit risk calculation. The RsD was instead derived from chronic inhalation studies in mice (Melnick et al. 1990) which reported the occurrence of malignant neoplasms in the lung.

The US EPA (2002) RsC of $0.3 \text{ } \mu\text{g/m}^3$ for 1×10^{-5} excess risk of leukemia incidence was selected for the evaluation of chronic inhalation exposure to 1,3-butadiene. This guideline was selected over the Health Canada guideline as it was based on an incidence rate for leukemia rather than

leukemia mortality rates. The US EPA guideline was selected over the TCEQ guideline as it was more conservative and considered national leukemia incidence rates and a longer exposure term. The OEHHA recommended the lowest guideline for the carcinogenicity of 1,3-butadiene based on the response in mice, however the consensus of four agencies on the use of an occupational study did not support the selection of the OEHHA guideline. 1,3-butadiene was included in the chemical group for leukemia following chronic inhalation exposures.

Chronic inhalation exposure limits for the non-carcinogenic effects of 1,3-butadiene have also been developed by the OEHHA (2014), TCEQ (2008) and US EPA (2002). All of these agencies developed non-cancer guidelines based on the NTP (1993) study of reproductive effects (ovarian atrophy) in mice following up to 2 years inhalation exposure to 1,3-butadiene.

The OEHHA (2013) identified a $BMCL_{05}$ HEC of 0.66 mg/m^3 (0.30 ppm) for ovarian atrophy from the NTP (1993) study. This was adjusted by an uncertainty factor of 300, to account for uncertainty in response between species (30) and sensitive individuals (10), resulting in a chronic REL of $2.2 \text{ } \mu\text{g/m}^3$ (0.001 ppm).

Similarly, the TCEQ (2008) determined a $BMCL_{05}$ HEC of 1.02 mg/m^3 (0.462 ppm) for ovarian atrophy based on the NTP (1993) study. An uncertainty factor of 30 was applied to account for sensitive individuals (10) and an incomplete database (3), resulting in a chronic ReV of $33 \text{ } \mu\text{g/m}^3$ (0.015 ppm). An interspecies uncertainty factor was not applied as an HEC was determined from the POD.

The US EPA (2002) determined a $BMCL_{10}$ HEC of 1.9 mg/m^3 (0.88 ppm) for ovarian atrophy based on the NTP (1993) study. This was adjusted by an uncertainty factor of 1,000, to account for uncertainty in response between species (3), an incomplete database (3), sensitive individuals (10) and extrapolation to a level below the 10% effect level (similar to a LOAEL-to-NOAEL extrapolation), resulting in a chronic RfC of $2 \text{ } \mu\text{g/m}^3$ (0.001 ppm).

The lowest recommended exposure limit of $2 \text{ } \mu\text{g/m}^3$ was selected for the current assessment of the non-carcinogenic effects of 1,3-butadiene, based on the US EPA (2002) RfC and supported by the OEHHA (2013) REL.

- not available

The toxicity associated with carbon monoxide is largely attributed to its ability to bind hemoglobin and form carboxyhemoglobin (COHb), which reduces the oxygen carrying capacity of blood and impairs the release of oxygen to tissues (WHO 2000). Toxicological and epidemiological research indicates that exposure to low levels of carbon monoxide (below concentrations resulting in overt poisoning) can result in adverse effects on tissues with the greatest oxygen demand, including the heart and brain (ATSDR 2012).

Individuals sensitive to the effects of carbon monoxide exposure include those with cardiovascular and/or respiratory disease (ATSDR 2012). However, the ATSDR has not developed MRL values for carbon monoxide based on the following rationale:

- The production of CO is physiologically regulated within the body and plays a role in regulating physiological processes, including those that underlie the adverse effects observed in the available human clinical, epidemiological or animal studies (e.g., brain and muscle oxygen storage and utilization);
- The exposure threshold for carbon monoxide, considering its physiological role, is likely at or near the endogenous production rate, therefore any external exposure to CO could exceed the threshold and result in adverse effects;
- The available animal and clinical studies do not identify NOAELs and when uncertainty factors are applied to the identified LOAELs, the resultant MRLs are within the range of ambient CO concentrations in the United States and would result in internal doses that would be similar to endogenous CO production; and,

- Considering the variation in heme production at different altitudes and the modes of action of carbon monoxide that involve competition with oxygen for heme binding sites, MRLs relevant to exposures at sea level may not apply at higher altitudes with lower oxygen partial pressures (ATSDR 2012).

The desirable Canadian NAAQOs for carbon monoxide are 15,000 $\mu\text{g}/\text{m}^3$ for a 1-hour averaging time and 6,000 $\mu\text{g}/\text{m}^3$ over 8 hours (CCME 1999). These objectives were based on the maintenance of COHb levels in the blood below 1% or the upper end of the range of COHb resulting from endogenous production in humans. The 1-hour and 8-hour averaged air concentrations of carbon monoxide that correspond to <1% COHb were determined using the PBPK model of Coburn, Forster, and Kane (CFK) (Coburn et al. 1965). B.C. MOE (2013) has adopted slightly lower 1-hour (14,300 $\mu\text{g}/\text{m}^3$) and 8-hour (5,500 $\mu\text{g}/\text{m}^3$) AAQOs as Provincial Level A Pollution Control Objectives for carbon monoxide. However no supporting documentation were available for these objectives.

The US EPA (2010; 2012) have developed 1-hour and 8-hour NAAQS for carbon monoxide of 40,000 $\mu\text{g}/\text{m}^3$ and 10,000 $\mu\text{g}/\text{m}^3$, respectively, to protect against COHb concentrations in the range at which adverse health effects could occur (>2%) based on the health outcomes reported in numerous epidemiological studies. The US EPA (2010) also utilized the CFK PBPK model (Coburn et al. 1965) to determine these air quality standards.

The OEHHA (2013) derived a 1-hour REL of 23,000 $\mu\text{g}/\text{m}^3$ for exposure to carbon dioxide. This exposure limit was set to achieve approximately 1% COHb, based on a LOAEL of 2% COHb reported by Aronow (1981) for the aggravation of angina in an epidemiological study (OEHHA 1999).

The WHO (2000) recommended 1-hour and 8-hour guidelines of 30,000 and 10,000 $\mu\text{g}/\text{m}^3$, respectively, for exposure to carbon monoxide. These guidelines were based on the maintenance of COHb levels below 2.5% using the CFK PBPK model (Coburn et al. 1965). The WHO (2000) considered these guidelines to be protective of non-smoking population groups with coronary artery disease (i.e., against acute ischemic heart attacks) and fetuses of nonsmoking pregnant women (i.e., against hypoxic effects) (WHO, 2000). The 1-hour and 8-hour WHO guidelines have been adopted as AAQOs by Metro Vancouver (2011)

The various acute exposure limits for carbon monoxide were all based on COHb levels in the blood. The Canadian NAAQOs were recommended for the maintenance of <1% COHb in blood or the upper end of the range of COHb resulting from endogenous production in humans (Health Canada 1994). The NAAQO 1-hour and 8-hour values of 15,000 and 6,000 $\mu\text{g}/\text{m}^3$, respectively, were selected for the current assessment of the acute inhalation effects of carbon

monoxide as they represent objectives that would result in COHb blood levels within the endogenous range. It is noted that the more recent and extensive evaluations completed by the US EPA (2010; 2012) and WHO (2000) suggest that higher levels of COHb in the blood (i.e., >2%) would be required before adverse effects are observed.

8.1.2 Chronic Inhalation

Table 8-2 presents the chronic inhalation exposure limits for carbon monoxide.

- not available

The majority of studies of adverse effects of carbon monoxide in humans emphasize steady-state %COHb values following exposures of acute duration. The formation of COHb following exposure to a fixed concentration of CO was reported to reach steady state after 6-8 hours of exposure (WHO 2000). Chronic exposure limits have not been established for carbon monoxide by any of the regulatory agencies reviewed and therefore chronic exposure to carbon monoxide was not considered in the current assessment.

9.0 Diesel Exhaust Particulate

9.1 Inhalation Exposure Limits

9.1.1 Acute Inhalation

No acute inhalation exposure limits were identified for DPM from the agencies reviewed; therefore the assessment of DPM was limited to chronic exposures (**Table 9-1**).

Table 9-1 Acute Inhalation Exposure Limits for DPM

Diesel engine exhaust contains thousands of chemicals which can complicate measurements of exposure. The carbonaceous fraction of diesel particulate, also known as elemental carbon, has been identified as a marker for diesel engine exhaust exposure. Elemental carbon represents a large fraction of the particulate mass of diesel exhaust and can be quantified at low levels. In the case of occupational studies, the diesel engine represents the only significant source for elemental carbon in the workplace (Birch and Cary 1996).

The US EPA (2003) and OEHHA (1998) have established chronic exposure limits for diesel particulate matter (DPM). The US EPA (2014) RfC of $5 \mu\text{g}/\text{m}^3$ is based on respiratory effects, including pulmonary inflammation and histopathological effects (fibrosis), in rats exposed to diesel exhaust for 16 hr/day, 6 days/week over 130 weeks (Ishinishi et al. 1988). A NOAEL of $460 \mu\text{g DPM}/\text{m}^3$ was identified from the study. This exposure concentration was converted to a human NOAEL_{HEC} of $144 \mu\text{g DPM}/\text{m}^3$ using a mathematical model of DPM deposition and clearance and assuming that equal pulmonary surface loadings in rats and humans would be associated with similar effects (US EPA 2003). An uncertainty factor of 30 was applied to the NOAEL_{HEC} to account for the response of sensitive individuals (10) and interspecies extrapolation (3). The OEHHA (1998) adopted the US EPA RfC of $5 \mu\text{g}/\text{m}^3$ as their chronic REL for diesel exhaust.

The US EPA (2003) RfC of $5 \mu\text{g}/\text{m}^3$ was selected for the evaluation of non-carcinogenic effects associated with exposure to DPM.

The National Toxicology Program (NTP) has classified diesel exhaust particulate as *reasonably anticipated to be a human carcinogen* based on studies in humans with supporting evidence from animal and mechanistic studies (NTP 2014). Diesel exhaust particles, which contain mutagenic and carcinogenic chemicals, are small enough to penetrate and persist in the lower lung region and were considered likely to account for observed human lung cancers; this is supported by evidence of a lack of lung tumours in rats exposed to diesel exhaust that was filtered to remove particles (NTP 2014). The International Agency for Research on Cancer (IARC 2012; 2014) has classified diesel engine exhaust as *carcinogenic to humans* (Group 1) based on sufficient epidemiological evidence for increased risk of lung cancer.

The OEHHA conducted a meta-analysis of studies reporting a relationship between lung cancer and exposure to diesel exhaust and determined that there was a positive association between occupational exposure to diesel exhaust and an increased risk of developing lung cancer (OEHHA, 2011). A unit risk factor of 0.0003 per $\mu\text{g}/\text{m}^3$ was recommended for particulate matter from diesel-fueled engines, based on the incidence of lung tumours reported in a case control study (Garshick et al. 1987) and a retrospective cohort study (Garshick et al. 1988) of US railway workers occupationally exposed to diesel exhaust. This unit risk factor translates to an RsC of $0.03 \mu\text{g}/\text{m}^3$, assuming an acceptable lifetime cancer risk of 1 in 100,000.

The Health Effects Institute (HEI) organized a Diesel Epidemiology Expert Panel to review two sets of epidemiological studies on diesel exhaust available at the time, including the Garshick (1987; 1988) studies of railroad workers as well as studies of truck drivers (Steenland et al. 1990) (HEI 1999). The panel recommended against using the railroad worker data following a

limited analysis of the exposure-response associations which, although suggesting lung cancer risk was greater in worker groups with higher exposure, also suggested that lung cancer risk decreased with increasing duration of employment (HEI 1999).

The US EPA reported that the weight of available evidence from epidemiology studies indicates that occupational exposure to diesel exhaust may pose a lung cancer risk (US EPA 2002; 2003). The studies on railroad workers (Garshick et al. 1987; 1988) and truck drivers (Steenland et al. 1990) were considered to have the best available exposure-response information for estimating cancer risk from occupational exposures; however, the US EPA (2003) did not consider these data suitable to derive a cancer risk estimate for environmental exposures, stating there was too much uncertainty in the available data and outlining gaps that would require evaluation before a confident quantitative dose-response analysis and subsequent derivation of cancer unit risk can be performed. The US EPA did consider the supporting data for DPM carcinogenicity in animals but found the data, particularly for rats, not relevant to human exposures as the tumour incidences reported were non-linear and associated with exposure concentrations high enough to produce lung particle overload (US EPA 2003).

Among the evidence for the IARC (2012) classification of diesel engine exhaust as carcinogenic to humans was a recently conducted US National Cancer Institute/National Institute for Occupational Safety and Health study which reported an increased risk of death from lung cancer in non-metal miners (silica limestone, salt, trona and potash mines), following chronic occupational exposure to diesel emissions (Silverman et al. 2012; Attfield et al. 2012). The results from the nested case-control (Silverman et al. 2012) and cohort mortality (Attfield et al. 2012) studies of diesel exhaust exposure in non-metal miners provided evidence (robust exposure-response relationships) for an effect on lung cancer from diesel exhaust exposure in both underground mine workers as well as surface-only workers, suggesting that diesel exhaust may be hazardous in both confined and open spaces and represents a potential public health as well as an industrial health hazard.

This same group of authors (Silverman, Attfield, and Garshick et al.) released exposure-response estimates for diesel engine exhaust and lung cancer mortality (Vermeulen et al. 2014). Following a meta-regression analysis of lung cancer mortality and cumulative exposure to elemental carbon (EC), an excess of 21 lung cancer deaths per 10,000 individuals was predicted following lifetime environmental exposure (through 80 years of age) to $0.8 \mu\text{g}/\text{m}^3$ EC (Vermeulen et al. 2014).

Elemental carbon (EC) refers to the carbon-containing components of DPM and is considered the carbonaceous fraction of a diesel particle. The EC content of DPM from heavy duty diesel engines can vary widely (from 20 to 90%) but recent emissions profiles (based on the limited data available) suggests that EC comprises approximately 75% of DPM from heavy duty diesel engines (US EPA 2002). So an excess of 21 lung cancer deaths per 10,000 individuals following exposure to $0.8 \mu\text{g}/\text{m}^3$ EC could be interpreted as an excess of 21 lung cancer deaths per 10,000 individuals following exposure to $1 \mu\text{g}/\text{m}^3$ DPM (i.e., $0.8 \mu\text{g}/\text{m}^3$ EC/0.75) and a DPM air concentration $0.005 \mu\text{g}/\text{m}^3$ would be associated with a 1 in 100,000 lifetime risk of lung cancer. This is a more conservative cancer risk estimate for DPM than the RsC (i.e., $0.03 \mu\text{g}/\text{m}^3$) currently recommended by the OEHHA (2011). It is important to note that the risk estimate presented for EC by Vermeulen et al. (2014) is still preliminary and no agency has adopted it as an exposure limit. The extrapolation of this information to a DPM air concentration is provided only for comparison sake (i.e., to a cancer risk estimate available from a recognized regulatory agency).

Exposure characterization remains a source of significant uncertainty in determining the potential human cancer risks of diesel particulate matter in diesel exhaust. Concerns have been raised that lung cancer risks based on exposures to past diesel exhaust emissions do not represent lung cancer risks from exposure to current or future emissions. These concerns are based on the recent modifications to diesel engines which serve to filter out diesel particulate matter and modifications to diesel fuel, including ultra-low sulphur content fuel, which also lowers the particulate content in emissions.

Despite the uncertainty associated with the cancer risk estimate available for DPM, the carcinogenic effects of inhalation exposure to DEP were considered for the current assessment, based on the IARC (2012) decision and recent epidemiological evidence presented. The OEHHA (2011) RsC of $0.03 \mu\text{g}/\text{m}^3$ was selected as it is the only regulatory guideline available for cancer risk. The data provided by Vermeulen et al. (2014) suggests that the OEHHA (2011) RsC is within an order of magnitude of a recent estimate for lung cancer risk associated with EC exposure. DPM was included in the chemical group for lung tumours following chronic inhalation exposures.

- not available

The ATSDR (2013) recommend an acute inhalation MRL of 50 $\mu\text{g}/\text{m}^3$ for formaldehyde. The MRL was based on a study by Pazdrak et al. (1993) which reported eye and nose irritation in human volunteers, including individuals with skin sensitivity to formaldehyde, following 2 hours exposure to 0.4 ppm (0.5 mg/m^3) formaldehyde. A 10-fold uncertainty factor was applied to the exposure concentration to account for use of a LOAEL (3) and variability in human response (3) (ATSDR 1999).

Health Canada (2006) recommends an acute (1 hour) indoor air quality guideline of 123 $\mu\text{g}/\text{m}^3$ for formaldehyde. This guideline represents one-fifth of the NOAEL of 1,230 $\mu\text{g}/\text{m}^3$ for eye irritation in human clinical studies (Kulle 1993).

A 1-hour ReV of 50 $\mu\text{g}/\text{m}^3$ was recommended by the TCEQ (2008) for acute exposure to formaldehyde. Similar to the ATSDR (1999), this ReV was based on eye and nose irritation in human volunteers, including individuals with skin sensitivity to formaldehyde (Pazdrak et al. 1993) as well as individuals with asthmatic symptoms (Krakowiak et al 1998) following 2 hours exposure to 0.5 mg/m^3 formaldehyde. A 10-fold uncertainty factor was applied to the exposure concentration (0.5 mg/m^3) to account for use of a LOAEL (3) and variability in human response (3) (TCEQ 2008).

The OEHHA (2014) recommend a 1-hour REL of 55 $\mu\text{g}/\text{m}^3$ and an 8-hour REL of 9 $\mu\text{g}/\text{m}^3$ as acute exposure limits for formaldehyde. The 1-hour REL of 55 $\mu\text{g}/\text{m}^3$ (0.044 ppm) is based on a NOAEL of 0.5 ppm for mild to moderate eye irritation in nonasthmatic humans exposed to 0.5-3.0 ppm formaldehyde for a 3 hour period (Kulle et al. 1987). The OEHHA (2008) calculated a BMCL_{05} of 0.44 ppm for eye irritation which was adjusted by an uncertainty factor of 10 to account for potential asthma exacerbation.

The OEHHA 8-hour REL of 9 $\mu\text{g}/\text{m}^3$ was based on an occupational study (Wilhelmsson and Holmstrom 1992) reporting nasal, eye and respiratory tract irritation in chemical plant workers exposed to a mean air concentration of 0.26 mg/m^3 formaldehyde over an average of 10 years (OEHHA 2008). The 8-hour REL was not considered for the acute exposure assessment as it was based on chronic exposure data and is intended for repeated 8-hour exposures.

The WHO (2010) recommended a short-term (30 minute) indoor air quality guideline of 100 $\mu\text{g}/\text{m}^3$ for formaldehyde. This guideline was derived from a NOAEL of 0.63 mg/m^3 for eye irritation (Lang et al. 2008; Kulle et al. 1987). The NOAEL was adjusted by a factor of 5, derived from the standard deviation of nasal pungency, resulting in a short term exposure guideline of 0.1 mg/m^3 . The short-term guideline was also considered protective of long-term health effects associated with formaldehyde exposure, including cancer. The carcinogenic effects of formaldehyde (i.e., nasal carcinomas in rats) were attributed to increased cell proliferation as a result of cell damage from exposure to concentrations at and above 2.5 mg/m^3 (WHO 2010).

The lowest 1-hour guideline of 50 µg/m³ (ATSDR, 1999; TCEQ 2008), based on eye and nasal irritation, was selected for the current assessment of acute inhalation exposure to formaldehyde. Formaldehyde was included in the chemical group for eye irritation following acute inhalation exposures.

10.1.2 Chronic Inhalation

¹ Key precursor event to tumourigenesis

The ATSDR (2013) recommend a chronic MRL of $10 \mu\text{g}/\text{m}^3$ (0.008 ppm) for formaldehyde. This MRL was based on a LOAEL of 0.24 ppm as an average 8-hour TWA for mild irritation of the eye and respiratory tract and mild damage to nasal epithelium in chemical plant workers occupationally exposed to formaldehyde for an average of 10.4 years (Holmstrom et al. 1989). The LOAEL was adjusted by an uncertainty factor of 30 for use of a LOAEL for mild effects (3) and human variability (10). No adjustment was made for extrapolation to continuous exposure based on evidence provided by Wilmer et al. (1987) that formaldehyde exposure concentration was more important than the product of exposure duration and concentration for determining the severity of epithelial damage of the upper respiratory tract (ATSDR 1999).

The OEHHA (2014) recommend a chronic REL of $9 \mu\text{g}/\text{m}^3$ for noncarcinogenic effects following chronic exposure to formaldehyde. This exposure limit is based on the Wilhelmsson and Holmstrom (1992) study NOAEL ($0.09 \text{ mg}/\text{m}^3$) and uncertainty factor (10) identified for the 8-hour REL for nasal, eye and respiratory tract irritation in chemical plant workers exposed to formaldehyde (OEHHA 2008).

The TCEQ (2008) recommend a chronic ReV of $11 \mu\text{g}/\text{m}^3$ for noncarcinogenic effects associated with chronic exposure to formaldehyde. This exposure limit is based on the Wilhelmsson and Holmstrom (1992) study NOAEL ($0.09 \text{ mg}/\text{m}^3$) for nasal, eye and respiratory tract irritation in chemical plant workers exposed to formaldehyde for 8 hours/day, 5 days/week over an average of 10 years. The NOAEL was adjusted for continuous exposure ($0.032 \text{ mg}/\text{m}^3$) and an uncertainty factor of 3 was applied to account for human variability (TCEQ 2008).

Health Canada (2006) recommended a long term indoor air quality guideline of $50 \mu\text{g}/\text{m}^3$ (based on an 8 hour average) for formaldehyde. This guideline is based on a study, by Rumchev et al. (2002), that reported an association between formaldehyde concentrations in indoor air and hospitalization for asthma in children from six months to three years of age. An air concentration of $50 \mu\text{g}/\text{m}^3$ represents the lower end of the exposure concentration range associated with no significant increase of asthma hospitalization. Although an increase in rat nasal carcinomas was reported in studies of exposures to high formaldehyde concentrations, this was considered the result of proliferative regeneration in response to cytotoxicity. Negligible cancer risks were predicted from lifetime exposure to $50 \mu\text{g}/\text{m}^3$ as this air concentration was considered to be sufficiently low to prevent irritation and inflammatory responses (Health Canada 2006).

IARC (2014) has classified formaldehyde as *carcinogenic to humans* (Group 1) and the NTP (2014) has listed formaldehyde as *known to be a human carcinogen*. Although not completely understood, there is evidence for a genotoxic mode of action for nasal tumours and lymphohematopoietic cancers observed in human and animal chronic formaldehyde exposure

studies (NTP 2014). Health Canada (2001), OEHHA (2011), TECQ (2007) and US EPA (1991) have developed chronic inhalation exposure limits based on the carcinogenic potential of formaldehyde.

The US EPA (1991) identified an inhalation unit risk of 1.3×10^{-5} per $\mu\text{g}/\text{m}^3$ from a study reporting nasal squamous cell carcinomas in rats following chronic (2 year) inhalation exposure to formaldehyde (Kerns et al. 1983). This unit risk is equivalent to an RsC of $0.8 \mu\text{g}/\text{m}^3$ assuming a 1 in 100,000 incremental cancer risk level. It is noted that the potential inhalation toxicity of formaldehyde is currently under review by the US EPA with a draft human health assessment released on June 2, 2010 for independent peer review and public comment (US EPA 2012).

The OEHHA (2011) derived an inhalation unit risk of 6×10^{-6} per $\mu\text{g}/\text{m}^3$ using the Kerns et al. (1983) data for nasal squamous cell carcinomas in rats. The OEHHA unit risk is equivalent to an RsC of $2 \mu\text{g}/\text{m}^3$ for an incremental cancer risk of 1 in 100,000. The upper range of cancer risks predicted by the OEHHA (2011) using the rat bioassay data were determined to be consistent with lung cancer mortality risk estimates for workers (cohort of over 26,000) exposed to formaldehyde (Blair et al. 1986).

Health Canada (2001) determined a TC_{05} of $9.5 \text{ mg}/\text{m}^3$ using data for the incidence of nasal squamous tumours in a more recent study in rats (Monticello et al. 1996). This air concentration is associated with a 5% (1 in 20) increase in tumour incidence over background. Dividing the TC_{05} by a factor of 5,000 results in an RsC of $1.9 \mu\text{g}/\text{m}^3$ for a 1 in 100,000 incremental cancer risk level.

The TCEQ (2008) recommend an RsC of $18 \mu\text{g}/\text{m}^3$ for formaldehyde assuming a 1 in 100,000 cancer risk level. This exposure limit was derived from Schlosser et al. (2003) who reported BMC and POD values for tumour incidence and cell proliferation in 3 data sets (including Kerns et al. 1983) describing these effects in rats following chronic formaldehyde inhalation. Nasal cell proliferation was the POD selected for guideline development as it represents a key event in formaldehyde-induced carcinogenesis. A POD_{HEC} of 0.44 ppm, representing the 95% BMCL_{01} , was determined for this endpoint. The RsC of 0.015 ppm ($18 \mu\text{g}/\text{m}^3$) was developed by applying an uncertainty factor of 30 to the POD to account for extrapolation from animal data (3) and human variability (10).

An exposure limit of 9 µg/m³, recommended by the OEHHA and supported by the ATSDR and TCEQ limits, was selected for the evaluation of non-carcinogenic effects following chronic inhalation exposure to formaldehyde. Formaldehyde was included in the chemical groups for nasal irritation following chronic inhalation exposures.

An exposure limit of 2 µg/m³, recommended by the OEHHA, was selected for the evaluation of carcinogenic effects following chronic inhalation exposure to formaldehyde. Although the US EPA provided the most conservative guideline (currently under review), the OEHHA conducted a more recent evaluation of the available data and considered the results of animal as well as human studies. Formaldehyde was included in the chemical group for nasal tumours following chronic inhalation exposures.

- not available

The TCEQ have recommended an interim ESL of $200 \mu\text{g}/\text{m}^3$ for short-term exposure to naphthalene based on odour (TCEQ 2014). This guideline is not health-based and no supporting documentation was provided for the odour threshold identified.

No other acute inhalation guidelines were identified for public exposure to naphthalene; however the American Conference of Governmental Industrial Hygienists (ACGIH) recommends a short-term exposure limit (STEL) of $79 \text{ mg}/\text{m}^3$ for naphthalene based on the potential for eye and respiratory tract irritation (OSHA 2012). This STEL was established for occupational exposures up to 15 minutes duration. A 1-hour exposure limit was derived from the ACGIH STEL as follows: $79 \text{ mg}/\text{m}^3 \times 15 \text{ min} = X \text{ mg}/\text{m}^3 \times 60 \text{ min}$. This assumes that the biological response to acute naphthalene exposure will be a constant that is a function of time and exposure concentration (i.e., Habers law). Using this assumption, a limit of $20 \text{ mg}/\text{m}^3$ was determined for 1-hour exposure to naphthalene. The STEL was developed for worker exposure

and therefore a 10-fold uncertainty factor was applied to the 1-hour air concentration to account for sensitive individuals in the general population. The resulting exposure limit of 2 mg/m³ (2,000 µg/m³) was selected for the evaluation of acute inhalation exposure to naphthalene. Naphthalene was included in the chemical groups for eye irritants and respiratory irritants following acute inhalation exposures.

11.1.2 Chronic Inhalation

Table 11-2 presents the chronic inhalation exposure limits for naphthalene.

- not available

The ATSDR (2005) recommend a chronic inhalation MRL of $4 \mu\text{g}/\text{m}^3$ for naphthalene. This MRL was based on the occurrence of nasal lesions as reported in two chronic inhalation studies in mice (NTP 1992) and rats (Abdo et al. 2001; NTP 2000). Mice were exposed to naphthalene concentrations of 0, 10 or 30 ppm for 6 hours/day, 5 days/week over 104 weeks (NTP 1992). Rats were exposed to 0, 10, 30 or 60 ppm naphthalene for 6 hours/day, 5 days/week over 105 weeks (Abdo et al. 2001; NTP 2000). Nasal lesions were observed in both species at the lowest exposure level (LOAEL of 10 ppm or $52 \text{ mg}/\text{m}^3$). A $\text{LOAEL}_{\text{HEC}}$ of $1.04 \text{ mg}/\text{m}^3$ (0.2 ppm) was determined for rat nasal lesions, after adjusting for continuous exposure and using EPA (1994) inhalation dosimetry for a category 1 gas to derive a human equivalent concentration (from rat to human) (ATSDR 2005). An uncertainty factor of 300 was applied to the $\text{LOAEL}_{\text{HEC}}$ to account for use of a LOAEL (10), extrapolation from rats to humans, with dosimetric adjustment (3) and human variability (10). The ATSDR MRL was not selected for the current assessment based on their use of inhalation dosimetry for a category 1 gas when there is evidence to suggest that naphthalene is a category 3 gas, as described below.

An RfC of $9 \mu\text{g}/\text{m}^3$ is recommended by the OEHHA (2000) for non-carcinogenic effects following chronic inhalation exposure to naphthalene. This RfC was based on the NTP (1992) LOAEL of $52 \text{ mg}/\text{m}^3$ (10 ppm) for the occurrence of nasal lesions in mice exposed to naphthalene 6 hours/day, 5 days/week over 104 weeks. This LOAEL was adjusted for continuous exposure ($9 \text{ mg}/\text{m}^3$) and a 1000-fold uncertainty factor was applied to account for use of a LOAEL (10), extrapolation from mice to humans without dosimetric adjustment (10) and human variability (10). In keeping with the US EPA (1998) IRIS approach, the OEHHA (2000) treated naphthalene as a category 3 gas, based on its low water solubility, low direct reactivity and data to suggest that the toxic effects of naphthalene on the respiratory tract are the result of a reactive oxygenated metabolite that may be formed in the liver or respiratory tract.

The TCEQ have recommended an interim ESL of $50 \mu\text{g}/\text{m}^3$ for long-term exposure to naphthalene based on health (TCEQ 2014), although no supporting documentation was provided for this ESL.

The US EPA (1998) developed an RfC of $3 \mu\text{g}/\text{m}^3$ for naphthalene. Similar to the OEHHA (2000), this guideline was based on a LOAEL of 10 ppm ($52 \text{ mg}/\text{m}^3$) for nasal lesions in mice chronically exposed to naphthalene (NTP 1992). The US EPA (1998) determined a $\text{LOAEL}_{\text{HEC}}$ of $9 \text{ mg}/\text{m}^3$ after adjusting for continuous exposure and following inhalation dosimetry guidance for a category 3 gas. An uncertainty factor of 3000 was applied to account for use of a LOAEL (10), extrapolation from mice to humans (10), human variability (10) and deficiencies in the database, including lack of a 2-generation reproductive toxicity study and lack of chronic inhalation data for other animal species (3).

Health Canada (2010) also established a TC of $3 \mu\text{g}/\text{m}^3$ for the noncarcinogenic effects of naphthalene based on the US EPA (1998) RfC.

The WHO (2010) and Health Canada (2013) both established indoor air quality guidelines of $10 \mu\text{g}/\text{m}^3$ for chronic exposure to naphthalene. The WHO (2010) indoor air quality guideline is based on a LOAEL of $53 \text{mg}/\text{m}^3$ for nasal lesions in rats chronically exposed (105 weeks) to naphthalene (NTP 2000). This LOAEL was adjusted to account for continuous exposure (6/24 hours \times 5/7 days) and an uncertainty factor of 1000 was applied to the LOAEL to account for extrapolation from rats to humans (10), human variability (10) and use of a LOAEL rather than a NOAEL. This annual average guideline is considered to be protective of the carcinogenic risks of naphthalene exposure (WHO 2010).

The Health Canada (2013) indoor air quality guideline was also established based on the NTP (2000) chronic inhalation study in rats. Similar to the WHO, Health Canada adjusted a LOAEL of $52 \text{mg}/\text{m}^3$ for continuous exposure and applied an uncertainty factor of 1000 to account for extrapolation from rats to humans (10), human variability (10) and deficiencies in the database. This guideline is considered to be protective of nasal cytotoxicity which can lead to nasal tumour development in rats following chronic naphthalene exposure. The minimum recommended sampling time for this guideline is 24 hours (Health Canada 2013).

IARC (2014) has classified naphthalene as possibly carcinogenic to humans (Group 2B) and the NTP (2014) has stated naphthalene is *reasonably anticipated to be a human carcinogen*. The supporting evidence for the NTP classification was provided in an NTP (2000) study in which chronic exposure to naphthalene produced highly malignant and extremely rare tumours of the lining of the nose of rats. The mechanism for naphthalene carcinogenesis is not clear but formation of a specific stereoisomer of naphthalene oxide (1R,2S-) as well as oxidative damage and DNA breakage may play a role (NTP 2014).

The OEHHA (2011) recommend a unit risk value of 0.034 per mg/m^3 for carcinogenic effects following chronic inhalation exposure to naphthalene. This corresponds to an RsC of $0.3 \mu\text{g}/\text{m}^3$ assuming 1 in $100,000$ (1×10^{-5}) excess lifetime cancer risk. Unit risk factors were developed for naphthalene using benchmark dose methodology and tumour incidence data for female mice, male rats and female rats (NTP 1992; 2000). The selected unit risk factor was for the male rat (NTP 2000), the species most sensitive to naphthalene exposure via inhalation (OEHHA 2011).

Health Canada (2013) and WHO (2010) recently developed an indoor air quality guideline of $10 \mu\text{g}/\text{m}^3$ for chronic exposure to naphthalene, which was considered protective of nasal cytotoxicity and tumour development. Both agencies attributed nasal and lung tumor development to a progression of effects from tissue damage in the nasal cavities and lungs as a result of high exposure concentrations, rather than a direct acting carcinogenic effect.

The majority of agencies have developed chronic inhalation exposure limits based on the non-carcinogenic effects (nasal lesions) of naphthalene reported in mice and rats. For the purpose of this assessment the lowest recommended RfC of 3 µg/m³ (US EPA, Health Canada) was selected for the assessment of noncarcinogenic effects following chronic inhalation exposure to naphthalene. Naphthalene was included in the chemical group for nasal irritation following chronic inhalation exposures.

- not available

Clinical studies of controlled human exposure have reported increased airway responsiveness to inhaled allergens in sensitive individuals as a result of acute exposure to nitrogen dioxide while epidemiological studies have correlated ambient nitrogen dioxide exposure with increased respiratory symptoms, emergency department visits and hospital admissions (AENV 2011; 2007; US EPA 2008).

The desirable Canadian NAAQOs for NO₂ are 400 µg/m³ for a 1-hour averaging time and 200 µg/m³ over 24 hours (CCME 1999). The Metro Vancouver (2011) 1-hour AAQO reflects the Canadian 1-hour desirable NAAQO for nitrogen dioxide. Supporting health-based documentation is not available for the nitrogen dioxide NAAQO values. Canada Ambient Air Quality Standards (CAAQS), defined by Environment Canada (2013) as *health-based air quality objectives for pollutant concentrations in outdoor air*, are being developed for Canada under the current Air Quality Management System. There are currently no CAAQS for nitrogen dioxide, although work has been initiated by federal, provincial and territorial governments (CCME 2013; Environment Canada 2013).

The OEHHA (2008; 2013) recommends a 1-hour REL of 470 µg/m³. This REL was equivalent to a NOAEL for increased airway reactivity in asthmatics exposed to nitrogen dioxide for 1 hour (CARB, 1992).

The US EPA (2008; 2012) has implemented a 1-hour NAAQS of 188 µg/m³ to protect against the respiratory effects of nitrogen dioxide. This standard considers the 3-year average of the 98th percentile of the yearly distribution of 1-hour daily maximum nitrogen dioxide concentrations. B.C. MOE (2014) recommends the same objective (188 µg/m³) for 1-hour exposure to nitrogen dioxide, with achievement based on the annual 98th percentile of daily 1-hour maximum values, over one year.

In controlled exposure studies, acute effects on the pulmonary function of asthmatics were observed at nitrogen dioxide concentrations levels greater than 500 µg/m³, with one meta-analysis suggesting an increase in bronchial responsiveness in asthmatics exposed to air concentrations above 200 µg/m³ (Folinsbee, 1992; WHO 2006). The WHO (2006) has therefore set a 1-hour exposure limit of 200 µg/m³ for short-term exposure to nitrogen dioxide.

Considering the weight of available evidence for airway reactivity of susceptible individuals (i.e., asthmatics) exposed to nitrogen dioxide, the lowest reported exposure limit, US EPA NAAQS of 188 µg/m³, was selected for use in the acute effects assessment of nitrogen dioxide. Nitrogen dioxide was included in the chemical group for respiratory irritation following acute inhalation exposures.

12.1.2 Chronic Inhalation

Table 12-2 presents the chronic inhalation exposure limits for nitrogen dioxide.

Table 12-2 Chronic Inhalation Exposure Limits for Nitrogen Dioxide

| Agency | Exposure Limit Type | Exposure Limit Value ($\mu\text{g}/\text{m}^3$) | Critical Organ or Effect | Species | Study | Source |

| WHO | Annual Average | 40 | Respiratory system | Human | Various | WHO 2006; 2000 |

- not available

The desirable annual average NAAQO for NO_2 is $60 \mu\text{g}/\text{m}^3$ (CCME 1999) which is the same as the B.C. MOE annual air quality objective for NO_2 (B.C. MOE 2014). No supporting documentation was available for these objectives. The WHO (2000; 2006) established an annual average guideline value of $40 \mu\text{g}/\text{m}^3$ for NO_2 . In the absence of a particular study or set of studies that clearly support an annual average guideline, the WHO considered background ambient levels of $15 \mu\text{g}/\text{m}^3$ and evidence of a 20% increase in respiratory illness in primary children with an increase of $28 \mu\text{g}/\text{m}^3$ nitrogen dioxide indoors (averaged over 1 year) (WHO 1997). The annual AAQO recommended for nitrogen dioxide by Metro Vancouver (2011) reflects the WHO (2000; 2006) guideline.

The US EPA (2012) annual standard for NO₂ is 100 µg/m³. This exposure limit is based on limited evidence to support a link between long-term exposure to nitrogen dioxide and adverse respiratory effects, particularly for persons with pre-existing pulmonary dysfunction (US EPA 2008).

Considering the available evidence for respiratory illness in children and individuals with pre-existing pulmonary dysfunction following long-term exposure to NO₂, the lowest WHO guideline of 40 µg/m³ was selected for the assessment of chronic inhalation exposure to NO₂.

- not available

The CCME (2000) developed a 24-hour Canada Wide Standard (CWS) of $30 \mu\text{g}/\text{m}^3$ for fine particulate matter ($\text{PM}_{2.5}$). The CWS is based on the 3 year average of the annual 98th percentile of the 24-hour average concentrations. The $\text{PM}_{2.5}$ CWS was based on the weight of available evidence for an association between acute exposure to ambient fine particulate matter and increased population mortality and morbidity, particularly related to the cardiovascular and respiratory systems, reported in numerous epidemiological studies from the US, Canada, Britain and Europe (WGAQOG 1998; Health Canada 2000; US EPA 2009).

The available data (epidemiological studies of large populations) have not identified a threshold concentration below which adverse effects do not occur; therefore actions to reduce ambient $\text{PM}_{2.5}$ concentrations is considered an improvement in air quality that will be beneficial to human health (CCME, 2000; WHO 2006). In addition to the CWS for fine particulate matter, the CCEM (2000) provides guidance for i) continuous improvement and ii) keeping clean areas. This guidance is intended to reinforce the health benefits of lowering ambient $\text{PM}_{2.5}$ air concentrations and dissuade actions that could result in "polluting up" to the CWS in areas where ambient $\text{PM}_{2.5}$ concentrations are low.

In May 2013, the Canadian Ambient Air Quality Standards (CAAQS) for PM_{2.5} were published in the Canada Gazette (Vol 147, No. 21). The CAAQS replaced the existing CWS for fine particulate matter, based on amendments to the Canadian Environmental Protection Act in 2013. In keeping with the intent for continuous improvement of air quality, the 24-hour PM_{2.5} standard, to be achieved by 2015, was to be 28 µg/m³ with a slightly more stringent standard of 27 µg/m³ recommended for 2020 (CCME 2012). The CAAQS is based on the 3 year average of the annual 98th percentile of the 24-hour average concentrations. The CCME (2000; 2012) have not established standards specific to coarse particulate matter (PM₁₀) as the management of PM_{2.5} was considered to result in the greatest health benefits and reductions in fine particulate matter are expected to reduce concentrations of coarse particulate matter (CCME 2000).

The California Air Resources Board (CARB, 2009) have established an acute ambient air quality standard of 50 µg/m³ (24-hour average) for PM₁₀. The acute health effects noted for coarse particulate matter exposure include worsening symptoms of asthma and acute bronchitis, particularly in the elderly and very young, as well as increased mortality or risk of hospitalization due to respiratory illness and lung disease (CARB 2009).

The US EPA (2012) implemented a 24-hour primary standard (NAAQS) of 35 µg/m³ for PM_{2.5} based on the 3-year average of 98th percentile concentrations. This standard is intended to increase protection against adverse health effects associated with acute exposure to respirable particles, including cardiovascular and respiratory effects and premature mortality (US EPA 2009). The US EPA (2012) also recommend an acute NAAQS of 150 µg/m³ for PM₁₀ which is not to be exceeded more than once per year over a 3 year average. Similar to PM_{2.5}, this standard is based on evidence of a causal relationship between acute exposure to coarse particulate matter (PM_{10-2.5}) and cardiovascular effects, respiratory effects and mortality. The evidence for these associations was limited in comparison to the evidence for PM_{2.5} and these associations were only apparent for short-term (not long-term) exposures to PM_{10-2.5} (US EPA 2009).

The WHO (2006) recommends a 24-hour guideline of 25 µg/m³ for PM_{2.5} and a 24-hour guideline of 50 µg/m³ for PM₁₀. The 24-hour guidelines refer to the 99th percentile of the distribution of daily values, i.e. the fourth next highest value of the year. The acute PM guidelines are intended to protect against peaks of pollution that could result in excess morbidity or mortality. The acute PM_{2.5} guideline was established based on relationships between the distributions of 24-hour means and annual average PM concentrations. The acute guideline for PM₁₀ was developed using PM_{2.5} as an indicator of potential health effects and applying a PM_{2.5}/PM₁₀ ratio of 0.5, which represents the approximate ratio of PM_{2.5}/PM₁₀ observed in urban areas. It is noted that the WHO (2006) prefers the use of the PM_{2.5} guideline for the evaluation of PM exposure.

Similar to the WHO (2006), the B.C. MOE (2013; 2009) also recommend 24-hour guidelines of 25 $\mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and 50 $\mu\text{g}/\text{m}^3$ for PM_{10} , which have been adopted by Metro Vancouver (2011).

The WHO (2006) also recommend three interim 24-hour target levels as a stepped approach for countries as they develop abatement measures to move towards eventual compliance with the guidelines. The highest interim targets are 75 and 150 $\mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and PM_{10} , respectively. These targets are associated with an approximate 5% increase in short-term mortality risk, relative to the short-term mortality risk at the recommended air quality guidelines. The next interim targets of 50 $\mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and 100 $\mu\text{g}/\text{m}^3$ for PM_{10} are associated with ~2.5% increase in short-term mortality risk compared to the guidelines. The lowest interim targets of 37.5 and 75 $\mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and PM_{10} , respectively, are associated with ~1.2% increase in short-term mortality. These risk estimates were determined using published risk coefficients from multi-centre epidemiological studies and meta-analyses (WHO 2006).

The lowest recommended 24-hour guidelines of 25 $\mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and 50 $\mu\text{g}/\text{m}^3$ for PM_{10} (WHO 2006) were selected for the assessment of potential health risks following acute inhalation exposure to fine and coarse particulate matter, recognizing the health benefits of maintaining ambient $\text{PM}_{2.5}$ air concentrations as low as possible.

$\text{PM}_{2.5}$ and PM_{10} were included in the population mortality/morbidity group for acute (24-hour) inhalation exposures.

13.1.2 Chronic Inhalation

| WHO | Annual Average | 20 | Based on PM _{2.5} | | Based on PM _{2.5} | WHO 2006; 2000 |

- not available

Annual average CAAQS for PM_{2.5} were published in the Canada Gazette in May 2013. The annual average standard to be achieved by 2015 will be 10 µg/m³ with a slightly more stringent standard of 8.8 µg/m³ recommended for 2020. The CAAQS is based on the 3 year average of the annual average concentrations (CCME 2012).

The CARB (2009) established annual ambient air quality standards of 12 and 20 µg/m³ (arithmetic means) for PM_{2.5} and PM₁₀, respectively. These standards are intended to protect against increased risk of hospitalization for lung and heart-related illness, premature death of the elderly and individuals with compromised pulmonary function, and reduced lung function or increased respiratory symptoms/illness in children.

The US EPA (2012) has implemented a primary annual standard (NAAQS) of $12 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ based on the 3-year average of 98th percentile concentrations. The annual standard is intended to continue protection against adverse health effects associated with chronic exposure to respirable particles, including cardiovascular effects, respiratory effects, and premature mortality (US EPA 2009).

The WHO (2006) established an annual mean guideline of $10 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$. This guideline represents the lower end of the air concentration range in the American Cancer Society (ACS) epidemiological study at which robust associations were reported between mortality and long-term exposure to $\text{PM}_{2.5}$ (Pope et al., 2002). Although threshold levels were not identified, the long-term epidemiological studies reported robust associations between $\text{PM}_{2.5}$ exposure and mortality and annual average target concentrations for $\text{PM}_{2.5}$ should take precedence over 24-hour average concentrations (WHO 2006). An annual mean guideline of $20 \mu\text{g}/\text{m}^3$ is recommended for PM_{10} assuming a $\text{PM}_{2.5}/\text{PM}_{10}$ ratio of 0.5 and using $\text{PM}_{2.5}$ as an indicator of potential health effects.

Three interim target levels were developed for the annual mean guidelines for PM as a stepped approach for countries as they develop successive and sustained abatement measures to move towards eventual compliance with the recommended air quality guidelines (WHO 2006). The highest interim targets (35 and $70 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and PM_{10} , respectively) are associated with a 15% higher long-term mortality risk relative to the mortality risk at the lowest recommended air quality guideline. Attainment of intermediate interim targets (25 and $50 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and PM_{10} , respectively) is expected to lower the mortality risks by 6% when compared to the highest interim targets. The lowest interim targets (15 and $30 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$ and PM_{10} , respectively) would reduce by the mortality risks by a further 6%, compared to the intermediate targets (WHO 2006).

The B.C. MOE (2013; 2009) have established an annual air quality objective of $8 \mu\text{g}/\text{m}^3$ and, in the absence of a safe threshold for human health effects, a planning goal of $6 \mu\text{g}/\text{m}^3$ for $\text{PM}_{2.5}$. The intent of the planning goal being *to guide airshed planning efforts and encourage communities to maintain good air quality in the face of economic growth and development* (B.C. MOE 2009). The annual objectives recommended for $\text{PM}_{2.5}$ by B.C. MOE (2013) have been adopted by Metro Vancouver (2011).

In the absence of an identified threshold for mortality risks associated with long-term exposure to $\text{PM}_{2.5}$ (WHO 2006), the lowest recommended guideline of $6 \mu\text{g}/\text{m}^3$ (B.C. MOE 2013) was adopted for the current assessment of risks associated with chronic inhalation exposure to $\text{PM}_{2.5}$. The chronic guideline of $20 \mu\text{g}/\text{m}^3$, supported by WHO (2006), CARB (2009); B.C. MOE (2013) and Metro Vancouver (MV 2011), was selected for the assessment of long-term exposure to PM_{10} .

PM_{2.5} and PM₁₀ were included in the population mortality/morbidity group for chronic inhalation exposures.

The ATSDR (2013) recommend a MRL of 26 $\mu\text{g}/\text{m}^3$ for acute exposure to SO_2 . This MRL was derived from a controlled exposure study which examined bronchoconstriction (changes in specific airway resistance) in mild asthmatics directly exposed, via a mouthpiece, to SO_2 during 10 minutes of exercise (Sheppard et al. 1981). The ATSDR do not recommend an averaging time for this MRL. It is noted that bronchoconstrictive responses to SO_2 exposures were reported to be highly variable in individual asthmatics (ATSDR 1998) and that the LOAEL identified from this study was based on the response of 2 out of a total of 7 individuals examined.

The desirable Canadian NAAQOs for SO_2 are 450 $\mu\text{g}/\text{m}^3$ for a 1-hour averaging time and 150 $\mu\text{g}/\text{m}^3$ over 24 hours (CCME 1999). The Metro Vancouver (2011) 1-hour AAQO for sulphur dioxide reflects the Canadian desirable NAAQO (450 $\mu\text{g}/\text{m}^3$), while the 24-hour AAQO of 125 $\mu\text{g}/\text{m}^3$ is slightly lower. Supporting health-based documentation is not available for the sulphur dioxide NAAQO or AAQO values. Canada Ambient Air Quality Standards (CAAQS), defined by Environment Canada (2013) as *health-based air quality objectives for pollutant concentrations in outdoor air*, are being developed for sulphur dioxide under the current Air Quality Management System. There are currently no CAAQS for sulphur dioxide, although work has been initiated by federal, provincial and territorial governments (CCME 2013; Environment Canada 2013).

The OEHHA (2013) recommends a 1-hour REL of 660 $\mu\text{g}/\text{m}^3$. This exposure limit was based on NOAELs reported in studies of respiratory effects in healthy, asthmatic and atopic individuals following controlled exposure to SO_2 with or without exercise (Roger et al., 1985; Linn et al. 1987).

To protect against respiratory effects, the US EPA (2012) has implemented a 1-hour NAAQS of 200 $\mu\text{g}/\text{m}^3$ for SO_2 . This standard considers the 3-year average of the 99th percentile of 1-hour daily maximum SO_2 concentrations. The basis for this exposure limit was the protection of sensitive individuals (including asthmatic children) from adverse respiratory effects during periods of exertion. This standard also considered epidemiological studies reporting causal associations between 1-hour daily maximum SO_2 concentrations and respiratory morbidity (increased hospital admissions). The 1-hour NAAQS was expected to substantially limit asthmatics short-term exposure (5-10 minutes) to SO_2 concentrations above 500 $\mu\text{g}/\text{m}^3$ (US EPA 2010). B.C. MOE (2014) has established the same 1-hour concentration of 200 $\mu\text{g}/\text{m}^3$ as an objective for SO_2 , with achievement based on the annual 99th percentile of daily 1-hour maximum values, over one year.

Breathing difficulties in response to SO₂ can occur within the first few minutes of exposure and may provoke asthma attacks, particularly during exercise; therefore, the WHO (2006) has recommended a 10 minute time-weighted average guideline of 500 µg/m³ for acute exposures to SO₂.

The WHO (2006) also recommends a 24-hour guideline of 20 µg/m³ for SO₂, with two interim 24-hour target levels of 125 µg/m³ and 50 µg/m³ as countries move towards compliance with the more stringent guideline. These recommendations are based on epidemiological studies that report an association between mortality, morbidity or lung function changes and 24-hour average SO₂ concentrations in ambient air (WHO 2006), similar to the observed associations with 24 hour concentrations of particulate matter. However, as discussed by WHO (2006), these epidemiological studies involve exposure to multiple chemicals and there remains considerable uncertainty as to whether SO₂ is the chemical responsible for the effects observed or whether SO₂ is a surrogate for ultrafine particles or another correlated substance. Given this considerable uncertainty and considering that 24-hour guidelines for particulate matter are being considered, the 24-hour guideline for sulphur dioxide was not included in the current assessment.

The US EPA NAAQS of 200 µg/m³ was selected for the evaluation of 1-hour exposures to sulphur dioxide as it was the most recently established acute guideline for SO₂ and is based on the results of a range of epidemiological studies that considered sensitive individuals, including asthmatic children. The WHO (2006) 10-min guideline of 500 µg/m³ was also selected based on the potential for asthma attacks within minutes of exposure to SO₂ during exercise. Sulphur dioxide was included in the chemical group for respiratory irritation following acute inhalation exposures.

14.1.2 Chronic Inhalation

Table 14-2 presents the chronic inhalation exposure limit for sulphur dioxide.

Table 14-2 Chronic Inhalation Exposure Limits for Sulphur Dioxide

| Agency | Exposure Limit Type | Exposure Limit Value ($\mu\text{g}/\text{m}^3$) | Critical Organ or Effect | Species | Study | Source |
|-----------------|----------------------|---|--------------------------|---------|-------|-------------------|
| ATSDR | - | - | - | - | - | ATSDR 2013; 1998 |

- not available

The desirable Canadian NAAQO for SO_2 over an annual averaging period is $30 \mu\text{g}/\text{m}^3$ (CCME 1999). Metro Vancouver (2011) also recommends an annual average AAQO of $30 \mu\text{g}/\text{m}^3$. The lowest B.C. MOE Pollution Control Objective recommended for annual air concentrations of SO_2 is $25 \mu\text{g}/\text{m}^3$.

Although documentation to support the basis for these objectives could not be located, for the purpose of this assessment, the B.C. MOE AAQO of $25 \mu\text{g}/\text{m}^3$ was selected for the evaluation of chronic exposure to SO_2 , as this represents the lowest of the annual average guidelines recommended by Canadian federal and provincial agencies.

| U.S. EPA | United States Environmental Protection Agency |
| U.S. FHA | United States Federal Highways Administration |
| WHO | World Health Organization |

Glossary

| Term | Definition |
|--|--|
| airborne noise | The propagation of noise through the air via vibrating air molecules |
| A-weighted decibel | The human ear and brain system is much more sensitive to sounds at mid-range and higher frequencies (or pitches) than at lower frequencies. Sound level meters are equipped with electronic filtering (or weighting) networks that replicate the ear’s frequency sensitivity. The most widely used of such a weighting network is called A-weighting, and sound levels measured with this weighting in place are expressed in dBA. |
| component noise level | Community noise environments typically feature contributions from a variety of sources, natural and otherwise. Measured community noise levels include the contributions of all sources in a noise environment. To model existing or future noise levels, however, it is often necessary to break the noise environment into its various components. Each significant noise source then contributes its own component noise level. The logarithmic sum of the component noise levels is then equal to the total noise level in a community. Component noise level is a generic term in which “noise level”, depending on the context, can refer to various specific noise metrics such as Ldn, Ld or Ln. |
| day-night equivalent sound level (Ldn) | Similar to the 24-hour equivalent sound level (Leq), the Ldn is an energy-averaged descriptor of 24-hour noise exposure expressed in dBA. In computing Ldn, all noise levels occurring between 10 p.m. and 7 a.m. are increased by 10 dBA to reflect the greater sensitivity of residential communities to noise at night. |
| daytime equivalent sound level (Ld) | The equivalent sound level for the time period from 7 a.m. to 10 p.m. |
| decibel | The standard unit of measurement for sound pressure level in which the reference value is 20 micropascals. This unit is a logarithmic ratio, multiplied by a factor of 10, of a physical quantity and a standard reference value. |
| equivalent sound level (Leq) | This is a steady sound level which, over a given 24-hour period, would result in the same overall sound energy exposure as would the actual fluctuating level. This term is expressed in units of dBA. |
| ground-borne vibration | Vibration produced by sources such as heavy trucks, trains, and construction activities that travels from the source to the receiver via the ground, often as a mixture of surface waves and compressive (longitudinal) waves |

| Term | Definition |
|---|--|
| impulsive noise | Noise such as from hammering, metal forming, and pile driving, that is characterized by the rapid rise and fall in noise levels, and the duration of which is brief (less than one second) compared to the interval between the noise events; also known as impact noise |
| low-frequency noise | Typically considered to be noise at frequencies below 200 hertz (Hz), low-frequency noise is of particular concern because it propagates more efficiently through the atmosphere, and penetrates more readily through building façades than higher-frequency noise. The human ear is, however, less sensitive to low-frequency sound than middle and higher-frequency sound. |
| maximum A-weighted sound pressure level (LAmax) | The maximum value of the sound pressure level during a noise event measured with a sound level meter using a fast time weighting. This level can be applied to pass-by noise from transportation noise sources and impulsive noise events. |
| nighttime equivalent sound level (Ln) | The equivalent sound level for the time period from 10 p.m. to 7 a.m. |
| ninety percent exceedance level (L90) | The noise level that is exceeded for 90% of a given time period. It is often considered to be representative of the background noise level. |
| noise | In general, noise is considered as unwanted sound. |
| per cent highly annoyed | The percentage of a population or community who are highly annoyed as a result of exposure to noise. |
| sensitive receptor | In the context of noise travelling through the air, and vibration travelling through soil or rock, a receptor refers to humans that might experience the sound and vibration energies. A sensitive receptor in this context is a person who is most influenced by such noise or vibration propagations by virtue of where he or she lives relative to the sources. Specific behaviour and physiology (e.g., age, general health) may make a person more vulnerable to noise and vibration. |
| sound | Sound consists of minute fluctuations in atmospheric (air) pressure usually created by vibrating objects. Human can sense sound pressure fluctuations occurring over the audible frequency range (approximately 20 Hz to 20,000 Hz). |
| sound exposure level | A logarithmic measure of the sound energy content of a well-defined noise event such as a vehicle pass-by or aircraft overflight, SEL is also a function of the intensity and the duration of the event. For example, the SEL of an event that features a steady noise at level L (dB) for a duration of T (seconds), would be presented as $SEL = L + 10 \log (T)$ dB. |

| Term | Definition |
|-------------------|---|
| sound level | The intensity of sound expressed on a logarithmic scale similar to the Richter scale of earthquake magnitude. The basic unit of sound levels is dB. The wide range of human hearing sensitivity is then compressed to sound level range from the threshold of hearing at approximately 0 dB to the threshold of pain at approximately 130 dB. |
| sound level meter | An instrument that measures, and often logs, sound pressure levels. A Type 1 sound level meter is the industry standard for precision field measurements used in environmental noise assessments and is accurate to ± 1 dBA. |
| tonal sound | Noise containing prominent audible tones such as backup alarms on trucks. |
| transient noise | Noise that is intermittent, coming and going over regular or irregular intervals. Examples of transient noise are noises from cyclical or irregular industrial or agricultural processes, the passing of trucks or trains, or the overflights of aircraft. |

1.0 Scope and Objectives

This Human Health Risk Assessment (HHRA) for atmospheric noise and vibration was undertaken to assess potential changes in human health risk as a result of Project-related changes in air quality and noise. The HHRA objectives, methods, and findings are described in the following section. The HHRA draws from the results of the assessment presented in **Section 4.10 Atmospheric Noise**. Potential health effects associated with current and future exposures to noise and vibration, at specific receptor locations, based on existing conditions and assumed future conditions associated with Project activities were considered.

2.0 Methods

2.1 Human Health Risk Assessment Approach

The HHRA for noise and vibration has been completed following a widely accepted risk assessment framework wherein potential hazards, exposure pathways, and receptors are evaluated to determine whether or not a human health risk is present. If all three of the conditions of hazard, exposure pathway, and receptor are met, then a potential risk to human health may exist. If such a potential does exist, then the health risk potential can be further quantified by directly comparing numerical estimates (measurements or predictions) of human exposures with guidelines for health effects that are promulgated by various authoritative health agencies.

The framework followed for this HHRA consists of the following components:

- **Hazard identification:** Identification of the environmental hazards that may pose a health risk (i.e., noise and ground-borne vibration)
- **Receptor identification:** Identification of the receptors that may be exposed to the above hazards
- **Exposure assessment:** Qualitative or quantitative evaluation of the likelihood and/or degree to which the receptors will be exposed to the hazards
- **Effects assessment:** Identification of published, scientifically reviewed threshold of effect values or guidelines to which exposure levels can be compared
- **Risk characterization:** Qualitative or quantitative assessment of the actual health risk each hazard poses to each receptor, based on the degree of exposure
- **Uncertainty assessment:** Review the uncertainty associated with the risk estimation

2.2 Noise and Vibration Measurements and Modelling

Noise monitoring was conducted at 41 sites located within the Highway 99 corridor which are considered representative of sensitive receptor locations within the study area. The study area for noise is defined as 500 m from either side of the Project alignment, except in the vicinity of the new bridge where it extends 1,600 m from either side of the Project alignment.

Noise effects were quantified using measurable parameters including daytime and nighttime equivalent continuous sound levels (L_d and L_n , respectively) and adjusted day-night sound level (L_{dn}). Daytime sound level is a time-averaged sound level over the 15-hour daytime period from 7 a.m. to 10 p.m. Nighttime sound level is a time-averaged sound level over the nighttime period from 10 p.m. to 7 a.m. The adjusted day-night sound level is time-averaged over a 24-hour period, with the nighttime contributions adjusted by 10 decibels to account for the expected increased annoyance due to noise-induced sleep disturbance and the increased residential population at night relative to daytime. The L_{dn} is calculated using the L_d and L_n .

2.2.1 Impulsive and Tonal Noise

Impulsive and tonal noise are often perceived as annoying and may have a high potential to disturb receptors; therefore, it is important that these source noise characteristics are accounted for in the noise assessment through the use of adjustments. The concept of the %HA indicator and the adjustments (i.e., impulsiveness and tonality) are described in detail in ISO (2003) and ANSI (2005).

Tonal noise is noise that contains prominent audible tones, such as backup alarms on trucks. Impulsive sound can be classified into one of three categories, as follows:

1. High energy impulsive – this refers to sound from one of several enumerated categories of sound sources, including quarry and mining explosives, sonic booms, demolition and industrial processes that use high explosives, military ordnance, explosive ignition of rockets and missiles, explosive industrial circuit breakers, and any other explosive source where the equivalent mass of dynamite exceeds 25 grams.
2. Highly impulsive – This refers to sound from one of several enumerated categories of sound sources, including small-arms gunfire, metal hammering, wood hammering, drop hammering, pile driving, drop forging, pneumatic hammering, pavement breaking, metal impacts during rail-yard shunting operations, and riveting.
3. Regular impulsive – This refers to impulsive noise from sources that are neither highly impulsive nor high-energy impulsive, for example, slamming car doors and truck tailgates, outdoor ball games, and church bells.

Impulsive and tonal characteristics of source noise are accounted for with adjustments in the L_{dn} level from the Project since their presence can increase the potential annoyance of sound. These adjustments correspond to a 12 dB, 5 dB, and 5 dB level change (that is, sound quality penalty) for highly impulsive, impulsive, and prominent tonal noises, respectively.

2.3 Hazard Identification

This first step in the HHRA framework comprises identification of environmental hazards that may pose a human health risk. Because the primary objective of this HHRA is to evaluate whether noise and vibration emanating from the Project may have an effect on human health, the hazards identified are as follows:

1. Noise – Noise metrics considered include time-averaged daytime noise level (L_d), time-averaged nighttime noise level (L_n), and time-averaged day-night noise level (L_{dn}). Source characteristics of the noise, for example, impulsiveness and tonality, are also considered and expressed as L_{Amax} .
2. Ground-borne vibration – Vibration that travels from the source to the receiver via the ground, often as a mixture of surface waves and compressive (longitudinal) waves. Vibration levels are characterized as ground-borne vibration level (VdB).

2.4 Receptor and Health Effect Identification

The HHRA for atmospheric noise and vibration involved identifying appropriate human health endpoints, and comparing published guidelines for these endpoints to Project-related exposure levels for both noise and ground-borne vibration. Of relevance to human health, a number of potential health effect endpoints associated with noise and ground-borne vibration exposure have been developed (WHO 1999, WHO, 2009, ISO 2003, ANSI 2005, US FTA, 2006), as described in the following sections.

2.5 Percent Highly Annoyed

High annoyance with noise is a reliable and widely accepted indicator of human health effects due to environmental noise (ISO 2003, ANSI 2005, U.S. FTA 2006, Michaud et al 2008). The change in %HA is frequently used as a measure of community response to noise and addresses the potential change in the fraction of people that would be highly annoyed. Evaluation of annoyance as a major health effect tends to capture other health effects as well, including sleep disturbance and speech interference, since these also increase an individual's perception of being highly annoyed.

The change in %HA is quantified by the difference in %HA calculated for the existing condition versus the %HA calculated after consideration of a project's noise contribution. The change in %HA is considered an appropriate indicator of noise-induced human health effects for the Project construction noise (long-term) and operation phase noise exposure. The %HA is calculated using the following equation as described elsewhere (ISO 2003, ANSI 2005, Michaud et al. 2008):

$$\%HA = \frac{100}{1 + \exp[10.4 - 0.132 * RL]}$$

In this equation, the rating level (RL) is typically an adjusted L_{dn} , with adjustments made depending on the type of noise source and source characteristics (for example, tonality).

The FTA published *Transit Noise and Vibration Impact Assessment* (U.S. FTA 2006) for use in characterizing impacts for all mass transit projects, including rapid, light or commuter rail, diesel/electric buses and their storage and maintenance yards. The FTA adopted a 6.5% increase in %HA as the guideline for a severe noise impact and this criterion is widely used in environmental assessments to indicate the potential severity of project noise impacts (Michaud et al 2008).

2.6 Sleep Impairment

Uninterrupted sleep is known to be a prerequisite for good physiological and mental functioning of healthy persons, while sleep disturbance is considered to be an environmental noise effect. Potential health effects related to continuous noise at night may present as sleep impairment. This can be manifested as either increases in sleep disturbance, or sleep awakenings, depending on the noise level.

Sleep disturbance as an effect of noise typically includes difficulty falling asleep, increased body movements (motility) during sleep alterations of sleep stages or depth, curtailed sleep duration and increased awakenings (WHO 1999, 2009). For continuous community noise, the WHO (1999) guidelines present an indoor L_n of 30 dBA for sleep disturbance. Because an outdoor-to-indoor transmission loss with windows at least partially open is roughly 15 dBA, an outdoor L_n of 45 dBA as a guideline for sleep disturbance is appropriate.

For intermittent noise, the WHO (1999) indicates that indoor sound levels should not exceed 45 dBA maximum A-weighted sound pressure level (L_{Amax}) more than 10 to 15 times per night (corresponds to an outdoor level of 60 dBA L_{Amax}). These guidelines have been adopted for the assessment.

With regard to sleep awakenings, the data presented by WHO (2009) show that at sound levels above L_n 55 dBA there is a measurable increase in the number of actual sleep awakenings. Since sleep awakenings is a direct measure of sleep impairment, a L_n threshold value of 55 dBA for continuous noise was adopted as the appropriate threshold that can contribute to adverse health effects.

Additionally, to calculate the number of individuals, of those exposed to L_n levels of 55 dBA, who are highly sleep disturbed (%HSD) the following algorithm developed by Miedema et al. (2001) was adopted:

$$\text{Road traffic: } \% \text{ HSD} = 20.8 - 1.05 (L_{\text{night}}) + 0.01486(L_{\text{night}})^2$$

This algorithm was derived based on a meta-analysis of epidemiological data and considers L_n in the range of 45 to 65 dBA, which spans the range of L_n levels predicted for the LAA. The %HSD was used to estimate the number of individuals that may experience sleep impairment within the LAA at levels that can adversely affect health.

For intermittent noise such as impulsive and transient noise, the WHO (1999) suggests that indoor sound pressure levels should not exceed 45 dBA maximum A-weighted sound pressure level (L_{max}) more than 10 to 15 times per night (or 1.1 to 1.7 times per hour). This corresponds to an outdoor level of 60 dBA L_{max} , based on a 15 dBA outdoor to indoor attenuation factor for sound penetration through partially opened windows. This value was adopted as an appropriate threshold for determining the potential for increased sleep disturbance due to intermittent noise.

2.7 Interference with Speech Comprehension

Noise interference with speech comprehension can result in a number of personal disabilities, handicaps, and behavioural changes. WHO (1999) advises that background indoor sound levels for continuous noise be maintained below 35 dBA to sustain adequate speech comprehension at sensitive receptor locations such as schools. This threshold was adopted for the assessment and is equivalent to an outdoor noise level of 50 dBA based on a 15 dBA outdoor to indoor sound attenuation factor for windows partially opened.

For effective outdoor speech comprehension, WHO (1999) advises that background outdoor sound levels be kept below 55 dBA for continuous noise. The higher recommended outdoor sound level was adopted for this assessment based on (i) people's tendency to speak in a louder voice when outdoors (where the separation between speakers is typically larger than indoors) and (ii) outdoor interferences such as wind and urban environment sounds may cause background noise levels to be raised.

2.8 Ground-Borne Vibration

Ground-borne vibration can be a concern for nearby neighbours of a transit system route or maintenance facility as it can cause buildings to shake and audible rumbling sounds. Some common sources of ground-borne vibration are trains, buses on rough roads, heavy trucks, and construction activities such as blasting, pile-driving, and operating heavy earth-moving

equipment (U.S. FTA 2006). Ground-borne vibration information within the U.S. FTA (2006) guidance document has been used in this HHRA to evaluate potential ground-borne vibration effects on the noise-sensitive receptors nearest to the new bridge approach piers.

The background vibration level in residential areas is typically 78 VdB or lower, while the threshold of perception for humans is roughly 93 VdB (U.S. FTA 2006). A vibration level of 103 VdB is the approximate dividing line between barely perceptible and distinctly perceptible. The range of interest for ground-borne vibration levels from a human and structural (building) perspective is from approximately 78 VdB (ambient) to 128 VdB, which is the general threshold where minor damage can occur in fragile buildings. The human and structural response to different levels of ground-borne vibration is summarized in **Table 1**.

Table 1 Human and Structural Response to Various Levels of Ground-borne Vibration

| Vibration Velocity Level (VdB) | Human / Structural Response |
|--------------------------------|---|
| 78 | Typical background vibration level in residential areas. |
| 93 | Approximate threshold for human perception of vibration. |
| 103 | Approximate dividing line between barely perceptible and distinctly perceptible. |
| 113 | Vibration acceptable only if there is an infrequent number of events per day (<30 vibration events of the same source per day). |
| 128 | Threshold where minor damage can occur to fragile buildings. |

The U.S. FTA (2006) guidance document also includes a set of threshold criteria for ground-borne vibration during transit operations (**Table 2**). The threshold criteria are based on past experiences with human sensitivity and community responses to ground-borne vibration. The U.S. FTA-developed criteria for environmental impact of ground-borne vibration from transit operations are based on the maximum level for a single event. The impact criteria are used to determine whether a project would result in ground-borne vibration impacts (i.e., human annoyance). The criteria are specified for three separate land use categories, as described in **Table 2**.

Table 2 Ground-borne Vibration Impact Criteria for General Assessment

| Land Use Category | Ground-borne Vibration Levels (VdB) | | |
|--|-------------------------------------|----------------------------------|----------------------------------|
| | Frequent Events ⁽¹⁾ | Occasional Events ⁽²⁾ | Infrequent Events ⁽³⁾ |
| 1: Buildings where vibration would interfere with interior operations. | 93 | 93 | 93 |
| 2: Residences and buildings where people normally sleep. | 100 | 103 | 108 |
| 3: Institutional land uses with primarily daytime use. | 103 | 106 | 111 |

Notes:

1. Frequent events = more than 70 vibration events from the same source per day. Most rapid transit projects fall into this category.
2. Occasional events = between 30 and 70 vibration events from the same source per day. Most commuter trunk lines have this many operations.
3. Infrequent events = fewer than 30 vibration events from the same source per day. This category includes most commuter rail branch lines.

The impact thresholds presented in **Table 2** are based on experience with vibration from rail transit systems rather than from construction equipment; however, they have been used in the past to assess human annoyance associated with vibration from construction equipment since no specific impact criteria exist for this purpose. As a conservative approach, the ground-borne vibration impact criteria of 100 VdB (i.e., Category 2 and more than 70 vibration events per day) is applied herein at the sensitive receptor locations for evaluation of human annoyance. It is anticipated that human annoyance due to ground-borne vibration will only occur during construction activities that involve pile driving, and that only those receptors nearest to the new bridge approach piers may be affected.

2.9 Summary of Noise and Vibration Guidelines for Project

The following summarizes the noise and vibration guidelines described above and used to assess the potential noise and vibration effects from the Project:

- *Sleep Impairment:* For continuous noise, an outdoor L_n of 45 dBA as a guideline for increased sleep disturbance and an outdoor L_n of 55 dBA as a guideline for increased sleep awakenings. For intermittent noise, outdoor sound pressure levels should not exceed 60 dBA L_{Amax} , more than 10 to 15 times per night, or 1.1 to 1.7 times per hour.
- *Speech Comprehension:* For sensitive receptors (e.g., schools, daycares), indoor L_d should not exceed 50 dBA and for outdoor spaces the L_d should not exceed 55 dBA in order to maintain adequate speech comprehension.

- *% Highly Annoyed*: The maximum allowed increase for change in %HA is 6.5%, taking into consideration noise source characteristics such as impulsiveness, tonality, and frequency.
- *Vibration Annoyance*: A maximum ground-borne vibration level of 100 VdB to prevent human annoyance at sensitive receptor locations.

The above guidelines apply to both the construction and operation phases of the Project. If any of the guidelines above are exceeded, the significance of the effects was considered and mitigation measures considered, as required.

3.0 Risk Characterization

Risk characterization involved comparing the modelled noise and ground-borne vibration results to the guidelines adopted for the assessment. If the predicted noise and vibration levels were less than the adopted guidelines, then adverse health effects are not expected and the noise or vibration effect was considered acceptable. If levels were above the guidelines, mitigation measures to reduce the modelled noise or vibration effect until it is compliant with the guidelines were identified.

3.1 Construction Phase Effects

3.1.1 Noise during Construction Phase

There will be increased noise levels associated with construction activities compared with existing conditions. The potential for health effects were evaluated by comparing the predicted construction phase noise levels with the applicable thresholds adopted for the assessment, as presented in **Table 3**.

The results indicate that the noise thresholds for % Highly Annoyed, sleep impairment (disturbance and awakenings) and speech comprehension are likely to be exceeded at many locations during construction. Also, the change in predicted noise level due to construction activities will be of sufficient magnitude that they will be perceived at several sensitive receptor locations.

The health effects thresholds used to interpret the predicted construction noise, have generally been developed for predictions of health effects based on long-term (or chronic) noise exposures. The available epidemiological data and associated conclusions about the implications of % Highly Annoyed for rates of hypertensive diseases is based on communities and populations that were experiencing chronic noise exposures, over many months and years. Similarly, those studies that have suggested a linkage between sleep disturbance and cardiovascular diseases or other human illness have been conducted on populations that were experiencing chronic exposures.

It is important to consider the potential exposure duration to construction noise when comparing predicted noise levels to the previously discussed thresholds of health effects. Adverse health effects associated with annoyance or sleep disturbance over shorter durations of days to weeks are unlikely, whereas noise exposures over many months could result in chronic health effects.

Table 3 Construction Phase Compliance with Noise Limits

- 1) Calculated from maximum predicted values
- 2) Exceeded for maximum predicted value only

"-" = value not estimated.

For this reason, the last column in **Table 3** indicates those sites that may experience increased construction noise for shorter duration near at-surface highway areas or interchanges in contrast with sites near the bridge that could experience noise from pile-driving or other activities for many months.

3.1.2 Ground-borne Vibration during Construction Phase

Construction activities may result in ground-borne vibration levels that can cause increased annoyance, especially at receptor locations located near the replacement bridge approach piers. Ground-borne vibration levels were estimated using a model adopted by the US FTA (2006) and the results are presented in **Table 4**. For a given receptor, the estimated range of vibration levels corresponds to lowest (minimum) vibration level from the most distant piling site to the highest (maximum) level from the closest piling site on the receptor side of Highway 99. Ground-borne vibration levels were compared with the annoyance criterion of 100 VdB, as previously discussed.

Table 4 Compliance with Ground-borne Vibration Criterion

| Site No. | Representative Receptor Location | Land Use | Ground-borne Vibration Level (VdB) | | Ground-borne Vibration Impact Criterion (VdB) |
|----------|--|--------------|------------------------------------|---------|---|
| | | | Minimum | Maximum | |
| 13 | 103 -14100 Riverport Way, Richmond | Multi-family | 77 | 83 | 100 |

| 17 | 5954 River Road, Ladner, B.C. | Residential | 88 | 116 | 100 |

| Site No. | Representative Receptor Location | Land Use | Ground-borne Vibration Level (VdB) | | Ground-borne Vibration Impact Criterion (VdB) |
|----------|---|--------------|------------------------------------|---------|---|
| | | | Minimum | Maximum | |
| 17a | Burr House, Deas Island Regional Park, Delta | Reg. Park | 83 | 86 | 100 |
| 16a | East of Parking, Deas Island Regional Park, Delta | Reg. Park | 88 | 93 | 100 |
| 17b | First Fork, Deas Island Regional Park, Delta | Reg. Park | 89 | 104 | 100 |
| 17c | Second Fork, Deas Island Regional Park, Delta | Reg. Park | 87 | 103 | 100 |
| 16b | Captain's Cove Marina, 6100 Ferry Road, Ladner | Multi-family | 92 | 126 | 100 |

Table 4 shows that the minimum predicted ground-borne vibration levels at the receptor locations associated with pile driving during construction all satisfy the applicable impact criterion. However, the maximum predicted ground-borne vibration levels exceed the criterion at four residential and one hotel receptor locations. As such, individuals residing nearest to the new bridge approach piers may experience annoyance during Project construction.

While ground-borne vibration effects are also predicted for the regional park areas considered, these are not expected to contribute to increased annoyance among park users.

Annoyance due to ground-borne vibration will primarily occur during construction activities that involve pile driving, and that only those receptors nearest to the new bridge approach piers may be affected. Receptors at greater distances from the pile driving activities are not anticipated to be affected by ground-borne vibration since ground-borne vibration levels decrease with distance.

3.2 Operation Phase Effects

3.2.1 Noise during Operation Phase (No Mitigation)

Without mitigation, there will be increased noise levels associated with routine operation phase traffic compared with existing conditions. The potential for health effects were evaluated by comparing the predicted unmitigated operation phase (2031) noise levels with the noise guidelines adopted for the assessment. The results are presented in **Table 5**.

Notes: 1. Speech interference threshold. 2. Sleep impairment thresholds (45 dBA for sleep disturbance, 55 dBA for sleep awakenings).

As presented in **Table 6** and summarized in **Table 7**, the thresholds for all three health indicators considered are currently (2013) being exceeded at most of the receptor locations evaluated. A summary of the results for each health indicator is provided below.

Percent Highly Annoyed

The predicted change in L_{dn} noise levels (unmitigated) ranges from -1.7 to 4.9 dBA compared with current (2013) levels. Based on these increases, six additional receptors locations are predicted to exceed the 6.5 %HA threshold and four locations are expected to have a lower %HA than current conditions. Individuals at the six locations where the 6.5 %HA is predicted to be exceeded may become highly annoyed.

Sleep Impairment

For nighttime noise, the total unmitigated Project L_n levels are predicted to range from 42.3 to 70.1 dB, which are -1.7 to 4.9 dBA higher than current (2013) levels. The change in nighttime noise levels with the Project will be perceptible at approximately 50 percent of the receptor locations based on a noise perception threshold of 3 dBA. Individuals living at receptor locations where L_n levels are predicted to increase may experience increased sleep impairment compared with existing conditions.

Speech Interference

Unmitigated outdoor daytime (L_d) noise levels are predicted to increase from 3.1 to 10.8 dBA. These noise increases will result in two additional receptor locations at Deas Island Regional Park exceeding the outdoor speech interference threshold of 55 dBA. Also, the 50 dBA threshold for sensitive indoor spaces (e.g., schools) was exceeded at one additional receptor location, but this location was at an outdoor space (Deas Island Regional Park).

It is important to consider that the incremental increases in noise levels (L_d , L_{dn} , L_n) during operation are expected to increase at many of the representative receptor locations considered by less than 3 dBA, which is the typical increase in noise levels needed to be perceptible by most individuals. This is important because humans are more likely to adapt (acclimate) if the increased levels of noise are not perceptible. Thus, potential health effects may be lower than predicted where noise level increases are less than 3 dBA, but not at the 14 receptor locations (approximately 35% of the total locations considered) where noise levels are predicted to increase by more than 3 dBA.

Table 6 Summary of Exceedances of Health-Based Noise Guidelines with Current (2013) Noise Levels

| Site # | Current Land Use | Do Current (2013) Noise Levels Exceed the Applicable Guidelines? | | | Do Future (2031) Mitigated Noise Levels Exceed the Applicable Guidelines? | | |

3.2.2 Noise during Operation Phase (With Mitigation)

With mitigation, the Project is anticipated to reduce noise levels by 4 to 8 dBA below current (2013) levels at most receptor locations. This will improve the overall sound environment within the study area and reduce the likelihood and severity of any health effects that may currently be associated with existing noise levels. The predicted changes in health indicators with the Project and mitigation measures are described below.

Percent Highly Annoyed

The estimated change in the %HA based on the algorithm described in **Section 2.5** using current (2013) and future mitigated noise levels is presented in **Table 7**. The %HA will be reduced at all receptor location compared with (2013) conditions. The predicted decrease in %HA with mitigation varies from approximately 2 to 20 %HA, with most receptors predicted to have reductions of 10 to 20 %HA. Collectively, the results indicate that there will be a significant reduction in the number of people who are highly annoyed compared with existing conditions.

Table 7 Estimated Percent Highly Annoyed Based on Current (2013) and Future (2031) Noise Levels at Noise-Sensitive Receptors

| Site # | Location | Current (2013) %HA | Future (2031) Mitigated %HA | Decrease in %HA with Mitigation Compared with Current (2013) Conditions |
|--------|-----------------------|--------------------|-----------------------------|---|
| 2 | Residential | 29.5 | 12.6 | 17.0 |
| 3 | Residential | 23.2 | 9.4 | 13.8 |

| 23 | Residential | 21.8 | 12.4 | 9.3 |

Shaded cells represent %HA increases greater than 6.5%.

Sleep Impairment

Even with mitigation, the sleep disturbance threshold of Ln 45 dBA will be exceeded at many receptor locations. However, mitigation is predicted to reduce Ln noise levels by 3 to 10 dBA below existing levels depending upon the type of mitigation and receptor location. This will significantly improve the nighttime noise environment and reduce Ln noise levels to below the 55 dBA sleep awakening threshold at a number of residences compared with existing conditions.

Speech Interference

With mitigation, there will be two receptor locations (places of worship) that are predicted to exceed the outdoor speech comprehension threshold of Ld 55 dBA. Additionally, one school is predicted to have Ld levels higher than the Ld 50 dBA threshold for learning environments. However, mitigation is predicted to reduce outdoor daytime (Ld) sound levels by approximately 1 to 9 dBA depending upon the type of mitigation and receptor location compared with existing noise levels. This will reduce the level of speech interference at all receptor locations to levels below existing conditions.

3.2.3 Ground-borne Vibration during Operation Phase

After completion of the construction phase, the Project is not anticipated to substantially affect ground-borne vibration levels experienced by sensitive human receptors. Before and during Project operation, ground-borne vibration levels are expected to be dominated by road traffic along Highway 99. In the future, ground-borne vibration levels within the study area will change, even without the Project, largely due to increases in road traffic volumes.

3.3 Uncertainty Analysis

Uncertainties associated with this HHRA for atmospheric noise are presented in **Table 8**, which provides an evaluation of each uncertainty and an opinion as to whether the uncertainty is acceptable.

Table 8 **Uncertainties of the Human Health Risk Assessment for Noise and Vibration**

| Risk Assessment Assumption | Justification | Analysis Likely to Over or Under Estimate Risk? | Assumption Acceptable? |
|---|---|---|------------------------|
| 1. The noise data (measured and modelled) provided for the HHRA are accurate, precise, and representative. | Noise monitoring and modelling was conducted in accordance with standard practice. Also, QA/QC measures were implemented to ensure that data was accurate, precise and representative. | Neutral | Yes |
| 2. The noise measurement locations selected reflect areas where noise levels are highest and are representative of all sensitive receptors within the study area. | The noise monitoring sites were selected based on site-specific information (e.g., receptor type, proximity to noise source, intervening surface, elevation of receptor relative to noise source), and therefore it is expected that the receptor locations with the highest noise levels have been identified. | Neutral | Yes |
| 3. The most current guideline values available have been used (i.e., ISO, ANSI, WHO, Health Canada, U.S. FTA). | This approach is in accordance with standard practice, and provides the most current scientific basis with which to conduct a risk assessment. | Neutral | Yes |

4.0 Conclusions

Four different endpoints were assessed to determine whether human health may be affected as a result of exposure to noise and vibration at representative noise-sensitive receptor locations affected by the Project. The endpoints considered were percent highly annoyed (%HA), sleep impairment, interference with speech comprehension, and annoyance associated with ground-borne vibration and the thresholds for each endpoint were selected from recognized international organizations including the ISO (change in %HA), the WHO (sleep impairment), the U.S. EPA (speech comprehension), and the U.S. FTA (ground-borne vibration).

4.1 Construction Phase

During Project construction without mitigation, the noise guidelines for speech comprehension and sleep impairment are predicted to be exceeded at the majority of the representative receptor locations. The % HA threshold is predicted to be exceeded at 14 of 24 locations, the sleep impairment threshold is predicted to be exceeded at 17 of 34 locations and the speech comprehension threshold is predicted to be exceeded at 24 of 34 locations. It is noted that many of these receptor locations currently have existing noise levels above the thresholds, but construction noise will generally increase noise levels by 5 to 20 dBA at many receptor locations. With mitigation, the %HA due to increased noise is predicted to be exceeded at 13 of 24 locations, which is only one receptor location less than without mitigation. However, the %HA will decrease at locations where mitigation has been considered, even though the %HA exceeds the 6.5% threshold.

Construction activities may result in ground-borne vibration levels that can cause annoyance at sensitive receptor locations. The most intense ground-borne vibrations are anticipated to be created by pile driving and dynamic sand compaction activities. The minimum predicted ground-borne vibration levels (associated with pile driving during construction) at sensitive receptor locations all satisfied the applicable impact criterion; however, the maximum predicted ground-borne vibration levels exceeded the 100 VdB impact criterion at 8 of the 13 receptor locations evaluated. As such, it is possible that individuals residing nearest to the new bridge approach piers may experience annoyance during Project construction. Receptors at greater setback distances from the pile driving activities are not anticipated to be affected by ground-borne vibration as ground-borne vibration levels attenuate with distance. Ground-borne vibration effects will be temporary and are only expected to be noticed during pile driving activities and periods of peak fill compaction.

Collectively, the results indicate that even with the use of mitigation measures to reduce noise levels during Project construction, individuals living at several locations within the study area may experience increased annoyance (% HA), increased sleep impairment and reduced speech comprehension. These effects will be reduced, but not eliminated, with proposed mitigation measures. The effects will be temporary and be most prevalent during peak construction periods/phases and will last for the duration of Project construction.

4.2 Operation Phase (2031) with Mitigation

With mitigation, the Project is anticipated to reduce noise levels below current (2013) levels at most receptor locations.

The %HA will be reduced at residential and institutional receptor locations compared with (2013) conditions. There will be a substantial reduction in the number of people who are highly annoyed compared with existing conditions.

In conclusion, with the implementation of Project-related mitigation, noise conditions in the study areas will improve relative to the existing condition. As such, the predicted reductions in noise levels compared with existing levels will reduce the likelihood and severity of any health effects that may currently be associated with existing noise levels.

8.0 Accidents and Malfunctions

This section identifies potential accidents and malfunctions that could occur during Project construction or operation, and discusses potential effects of such incidents on VCs considered in this Application. An overview of mitigation measures, including design and contract specifications to avoid or minimize environmental effects is also provided. Further detail on mitigation measures and best practices that will be implemented during design, construction, and operation to minimize the potential for accidents and malfunctions to occur is included in **Section 12.0 Management Plans**.

During construction, adherence to the practices and procedures contained in the Construction Environmental Management Plan (CEMP) will minimize the potential for accidents and malfunctions to occur. As described in **Section 12.0 Management Plans**, the CEMP will be developed prior to commencement of Project construction. Preparation of such a CEMP, which would include an Emergency Response and Spill Contingency Plan that describes measures to be taken in the event of an environmental emergency, is a standard Ministry requirement prior to road and structure construction (the Ministry's *2013 Design Build Standard Specifications for Highway Construction* (B.C. MOTI 2013)).

The Project will be designed and built in accordance with the *BC Supplement to TAC Geometric Design Guide, 2007 edition* (B.C. MOT 2007), the Ministry's *2013 Design Build Standard Specifications for Highway Construction* (B.C. MOTI 2013), CSA S6-14 Canadian Highway Bridge Design Code and Bridge Standards and Procedures Manual Volume 1 – Supplement to CHBDC S6-06. In general, replacement of the Tunnel with a new crossing and the proposed highway improvements are expected to lower the risk of accidents and malfunctions during highway operations and maintenance.

8.1 Potential Accidents and Malfunctions Scenarios

For this assessment, accidents and malfunctions are defined as follows:

- An accident is an unexpected occurrence, unplanned event, or unintended action that can result in an adverse effect.
- A malfunction is the failure of a piece of equipment, device, or system that can result in an adverse effect.

Potential accidents or malfunctions that could occur during Project construction or operations that could affect the environment are listed below.

Project Construction

- Incidents resulting in release of contaminants/hazardous materials (e.g., hydrocarbon fuels, lubricants, concrete) from marine or land-based vehicles, machinery, or equipment to the environment.
- Structural failure of a culvert, ditch, detention pond, or sediment containment measure resulting in localized flooding, erosion, sedimentation, or discharge of deleterious material into the aquatic environment.
- Damage to utilities (e.g., buried natural gas pipes, water mains) resulting in release of deleterious material into the aquatic environment.
- Marine vehicle collision resulting in obstruction of navigation.

Project Operation

Potential accidents and malfunctions during highway operations and maintenance that could adversely affect the environment include:

- Incidents resulting in the release of contaminants/hazardous materials (e.g., hydrocarbon fuels, lubricants, concrete) to the environment during maintenance activities.
- Structural failure of a culvert or ditch resulting in localized flooding or erosion, sedimentation, or discharge of deleterious materials to the aquatic environment.
- Failure of a Project component.

A key goal of the Project is to improve safety for all users of the corridor, including vehicle operators and passengers, cyclists, and pedestrians. Widening of the highway to extend transit/HOV lanes, reducing congestion at the Fraser River crossing, and improving cyclist and pedestrian access and facilities help in achieving this goal. Reduced congestion will also improve access for emergency response vehicles in the event of an accident or incident.

Accidents and other types of emergencies will be managed in accordance with the Ministry's *Maintenance Specifications* (MOT, 2003) and related standards. Emergency responder access to the highway will be improved due to the additional capacity, reduction in traffic congestion, and improved emergency vehicle access to incidents. Given these considerations, traffic-related accidents and malfunctions during Project operations are not included in the assessment.

8.2 Assessment Methods and Interactions

8.2.1 Methodology

The matrix presented in **Section 8.2.3** shows the potential interactions between accidents and malfunctions and VCs based on review of relevant literature, other environmental assessments, and professional judgment. Interactions between an accident or malfunction and VC resulting in a potential effect are carried forward in this assessment.

For each accident or malfunction considered, the following steps were taken to assess the potential risk:

1. The accident or malfunction scenario is described.
2. Measures to reduce the likelihood and consequence of the accident or malfunction on a VC are identified.
3. The likelihood of the accident or malfunction to occur post-mitigation is determined.
4. The consequence of the accident or malfunction (post-mitigation) is assessed by characterizing the magnitude, frequency, geographic extent, and reversibility of the consequence on the VC.
5. The potential risk is determined based on the risk evaluation matrix (i.e., likelihood multiplied by consequence).

8.2.2 Risk Evaluation Methods and Definitions

Likelihood is the probability of the event actually occurring while consequence is a measure of the severity and magnitude of the potential adverse effects. Likelihood and consequence are each qualitatively ranked. Definitions for ranks and levels are provided in **Table 8.2-1**.

Likelihood ranges from remote to very high; consequence ranges from very low to very high.

Table 8.2-1 Definitions for Categories of Likelihood and Consequence

| | Category | Description |
|------------------------------------|-----------|--|
| Likelihood Post-Mitigation | Remote | Event could occur only under exceptional circumstances. |
| | Low | Event not likely to occur under normal circumstances. |
| | Moderate | Event could occur at some point under normal circumstances. |
| | High | Event will probably occur in most circumstances. |
| | Very high | Event is expected to occur in most circumstances and has a history of occurrence. |
| Consequence Post-Mitigation | Very low | Effects are localized and short-term in duration. Recovery is anticipated within days or weeks of incident occurring. |
| | Low | Effects are localized and short-term in duration. Recovery is anticipated within one to two years of incident occurring. |
| | Moderate | Effects are widespread. Recovery is anticipated within two to five years of incident occurring. |
| | High | Effects are widespread. Recovery is not anticipated within five to ten years of incident occurring. |
| | Very high | Effects cause a loss of a considerable portion of a VC. Recovery is not expected. |

Risk was determined using a risk evaluation matrix (**Table 8.2-2**), adapted for the Project from the Risk Management Guideline for the BC Public Sector document (Province of British Columbia Risk Management Branch and Government Security Office 2012).

Table 8.2-2 Risk Evaluation Matrix

| | | Consequence Post Mitigation | | | | |
|-----------------------------------|------------------|-----------------------------|--------|----------|-----------|-----------|
| | | Very low | Low | Moderate | High | Very high |
| Likelihood Post Mitigation | Very High | Low | Medium | High | Very High | Very High |
| | High | Low | Medium | High | High | Very High |
| | Moderate | Low | Low | Medium | High | High |
| | Low | Low | Low | Medium | Medium | Medium |
| | Remote | Low | Low | Low | Low | Medium |

Reference: Adapted from Province of British Columbia Risk Management Branch and Government Security Office, 2012

8.2.3 Potential Interactions with Valued Components

Potential interactions of a Project-specific accident or malfunction with each VC are summarized in **Table 8.2-3**. A check mark indicates that an interaction could occur, in which case it is assessed in the subsequent sections.

Table 8.2-3 Potential Interactions of Project Accidents and Malfunctions with Valued Components

| Accidents and Malfunctions Scenario | Fish and Fish Habitat | Marine Mammals | Vegetation | At-risk Amphibians | Wildlife | Marine Use | Land Use | Agricultural Use | Visual Quality | Human Health | Heritage Resources |

8.3 Likelihood, Consequence, and Risk of Potential Accidents and Malfunctions

A description of the potential Project-related accident or malfunction scenarios identified in **Section 8.1**, and a discussion on their likelihood and consequence is presented below. Mitigation measures to minimize the likelihood of accidents or malfunctions and their consequence are identified, and a conclusion on the potential risk of the accident or malfunction is provided.

8.3.1 Release or Spill of Contaminants or Hazardous Materials

For the purposes of this assessment, a spill is considered to be any release or discharge into the environment, not authorized under the provincial *Environmental Management Act*, of a substance in an amount equal to or greater than the amount specified in the *Spill Reporting Regulation* (Government of BC 2008). The Project assessment considers spills reportable under the *Spill Reporting Regulation*, and spills that would not meet reporting criteria under this regulation. Spills of a contaminant or hazardous material are considered for the construction and operation (restructured to maintenance activities) phases of the Project.

Sources of spills during construction are generally associated with storage and use of fuel and machinery, with less likely spills associated with vehicle or vessel collision. During construction and Tunnel decommissioning, there is potential for minor spills involving release of hydrocarbon fuels, lubricants, uncured concrete, concrete-affected waters, or other materials into the aquatic environment. Spills of toxic or hazardous substances into the environment could result in temporary degradation of watercourses or terrestrial areas.

The most likely spill scenario is the spill of relatively small amounts of fuels, lubricants, or other equipment fluids which may occur through refueling or leaks from machinery. The volume of these spills would be minor (less than a few litres), localized, limited to the required on-site containment areas, and readily cleaned up. Onsite storage and use of hazardous materials will comply with all relevant regulations, and secondary containment measures will make an uncontained spill unlikely.

Mitigation Measures

Mitigation measures to reduce the likelihood and consequence of an accidental spill into the environment will include the following:

- Training construction and maintenance personnel on spill prevention and management.
- Training construction and maintenance personnel on environmentally sensitive areas within the Project alignment.
- Maintaining equipment and machinery and regularly inspecting them for leaks.
- Development and implementation of EMPs, describing best practices for management and clean-up of hazardous spills.
- Storing spill abatement equipment onsite.
- Secondary containment for all hazardous materials.
- Locating refuelling and maintenance areas a minimum of 30 m from any water bodies or sensitive areas.
- Development and implementation of reporting and monitoring requirements for any spill of toxic or hazardous material to the Ministry and, when applicable, to the provincial Environmental Emergency Program, under the *Environmental Management Act*, S.B.C. 2003, c. 53, Spill Reporting Regulation, B.C. Reg. 263/90.

These measures will be specified in more detail in the Emergency Response and Spill Contingency Plan component of the CEMP and OEMP developed for the Project (see **Section 12.0 Management Plans**).

In addition to the above, measures will be in place to reduce the likelihood and consequence of spills from collisions involving construction vehicles, vessels, or machinery, and general traffic moving near or through the construction site.

A Construction Traffic Management Plan and a Marine Access Management Plan will be developed prior to the start of construction. These plans will describe mitigation measures to be implemented to prevent or manage potential land- and marine-related traffic hazards during construction, such as:

- Mitigation measures that may include barriers, speed limits, compliance with transport and storage of dangerous goods in accordance with the *Transportation of Dangerous Goods Act*, R.S.B.C. 1996, c. 458, and specific provisions for worker safety.
- Measures to promote safety and security of onsite personnel and all users of the corridor including the public, minimizing the potential for vehicle-related accidents.

- Procedures for coordination with emergency responders (police, ambulance, fire) and immediate measures for managing spills.
- Specifications, that in the event of a vehicle-related accident, waste materials will be disposed of in accordance the emergency response measures described in **Section 12.1.5 Emergency Response and Spill Contingency Plan.**
- Mitigation measures to minimize the potential for vessel-related accidents including communications protocols and emergency procedures.
- Specifications that navigational clearances for the new bridge will be incorporated into the Project design in accordance with the requirements of Transport Canada Navigation Protection Program, pursuant to the *Navigation Protection Act*, R.S.C., 1985, c. N-22. The proposed navigational clearances are described in **Section 5.2 Marine Use.**

Likelihood

The potential of a spill of contaminants or hazardous materials entering the environment and resulting in an adverse effect to terrestrial or aquatic wildlife, agricultural use, land use, or human health is unlikely to occur post-mitigation. The mitigation measures described above will be implemented to avoid or minimize the potential for a spill to occur, and to mitigate and manage the potential effect in the event of a spill occurring. With mitigation in place, the likelihood of a spill of hazardous materials reaching the environment and having an adverse effect on VCs is considered to be low.

Consequence

The geographic extent of a spill would depend on the quantity of the material spilled and location where it was spilled. With the implementation of appropriate spill response procedures and the mitigation measures described above, it is anticipated that a spill would be localized in geographic extent. The frequency of a spill into the environment is considered to be uncommon. The effect is anticipated to be reversible, with baseline conditions naturally restored after the disturbance has ceased and appropriate remediation measures have been applied.

The magnitude and duration of any potential effects of a hazardous material spill would depend on the quantity spilled, the location of the spill, and (potentially) the time of year in which the incident occurs.

Spill response procedures will be developed to contain and manage a spilled product in a localized area, thus limiting potential interaction with the receiving environment. For example, re-fueling will not be permitted near at-risk vegetation communities, within 30 m of watercourses, or near important habitat for species of conservation concern.

The consequence of spill of contaminants or hazardous materials resulting in adverse effects to VCs is assessed to be very low given that effects would be localized and short-term in duration, and recovery would be within days or weeks of incident occurring.

Risk Conclusion

The mitigation measures outlined above are standard practice in the industry and have been proven effective in reducing the likelihood of a spill to occur. The implementation of spill contingency and cleanup measures are well-tested and effective means of reducing the consequences of spills. The confidence in this assessment is high, since the assessment is based on well-documented cause-effect relationships.

With the implementation of the mitigation measures described, a spill has a low likelihood of occurring and resulting in an adverse effect to VCs. Although it is possible that spills may occur during construction; even with the preventative mitigation measures applied, the implementation of spill contingency and cleanup measures are expected to reduce the consequence of an adverse effect to receptor VCs in the event that a spill did occur.

The consequence of a spill ranges from very low to low, depending on the size of the spill, type of material, location, and circumstances.

Given the low likelihood and very low to low consequence of a spill of contaminants or hazardous material resulting in an adverse effect on VCs, using the risk evaluation matrix, the risk is determined to be low.

A summary of residual effects resulting from a spill of contaminants or hazardous materials is presented in **Table 8.3-1** for those VCs where an interaction may occur. The more detailed VC-specific definitions for magnitude, extent, duration, frequency, and reversibility are presented in **Section 4.0 Environmental Effects Assessment** to **Section 7.0 Health Effects Assessment**, and are used in cases where they are relevant for both the Project effects assessment and for the accident or malfunction effects assessment.

Table 8.3-1 Residual Effects of Spills

| Valued Component | Residual Effects Criteria | | | | | | Consequence | Likelihood | Risk |
|-----------------------|---------------------------|-----------|--------|------------|-----------|---------------|-------------|------------|------|
| | Direction | Magnitude | Extent | Duration | Frequency | Reversibility | | | |
| Fish and Fish Habitat | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| At-risk Amphibians | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Marine Mammals | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Vegetation | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Terrestrial Wildlife | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Land Use | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Agricultural Use | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Human Health | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |

8.3.2 Structural Failure of Containment Structures

Structural failure of a containment structure is considered to include failure of a culvert, ditch, detention pond, or sediment containment structure resulting in localized flooding, erosion, sedimentation, or discharge of sediment-laden water into the aquatic environment during Project construction or operation.

Sediment and erosion control structures will be installed during Project construction and operational maintenance activities for work in and around riparian zones and waterbodies. Under unexpectedly severe weather conditions or calamitous events, it is possible that structures could fail, potentially releasing sediment-laden water into road-side ditches or watercourses. Failure of a culvert may result in increased or concentrated overland flow, increased erosion and sediment transport, and potentially accidental release of sediment-laden water into the receiving environment.

Depending on the extent and duration of the incident, accidental release of sediment or sediment-laden water into a watercourse may result in degradation of water quality, potentially affecting fish and fish habitat, at-risk amphibians, and marine mammals. In addition to impacts to aquatic organisms, elevated sediment levels may block, damage, or overwhelm drainage infrastructure or culverts resulting in damage to or malfunction of irrigation and drainage equipment.

Mitigation Measures

In the event that a culvert, ditch, or sediment containment structure fails, mitigation will be applied to address the potential for erosion or sedimentation to affect receiving aquatic or terrestrial environments. As discussed in **Section 12.0 Management Plans**, an Erosion and Sediment Control Plan will be developed as part of the CEMP. The primary objective of the plan will be to ensure that, during Project construction, water from the site that is discharged into the receiving environment will meet suspended sediment requirements outlined in the Canadian Council of Ministers of the Environment (2002) and the B.C. (B.C. MOE 2006) water quality guidelines.

Mitigation measures and best practices to address the potential for release of deleterious substances into the environment will be incorporated into the Project design, and will be implemented during construction (as described in **Part B – Assessment of Environmental, Economic, Social, Heritage, and Health Effects** of the Application), minimizing the potential for adverse environmental effects from the Project.

Sediment and erosion control will be a primary focus during Project construction activities occurring near the Fraser River South Arm, Green and Deas Sloughs, and roadside ditches/waterbodies within the Project alignment. Culverts, ditches, and sediment containment structures will be designed in accordance with the Ministry's *2013 Design Build Standard Specifications for Highway Construction* (B.C. MOTI 2013).

During Project operation, temporary erosion control measures may be required in the event of a large natural event (see **Section 9.0 Effects of the Environment on the Project**), or during activities involving maintenance of stormwater or drainage infrastructure.

Mitigation and best practices that will be implemented to mitigate potential erosion or sedimentation resulting from structural failure of a culvert, ditch, or sediment containment structure will be included in the Erosion and Sediment Control Plan component of the CEMP and OEMP and will include measures to:

- Develop temporary drainage systems to receive, filter, and direct stormwater and runoff during construction
- Store waste material and soil to prevent possible entry into the aquatic environment

- Install silt fences or other appropriate mitigation
- Reduce the extent and duration of ground disturbance during construction
- Protect exposed soil
- Install temporary and permanent erosion control measures and bio-filtration ponds/marshes and revegetation of slopes
- Establish an erosion and sediment control inspection and maintenance program

More information on the mitigation measures that will be implemented to manage potential sediment release or erosion is provided in **Section 12.0 Management Plans**.

Likelihood

The likelihood of erosion or sedimentation resulting from structural failure of a culvert, ditch, or sediment containment structure during construction is considered to be low. With implementation of mitigation measures, such events are anticipated to be avoided.

Consequence

In the unlikely scenario that sediment-laden water reaches the aquatic environment (e.g., the Fraser River or a road side ditch) as a result of failure of a culvert, ditch, or sediment containment structure, water quality could be affected. Such changes could subsequently affect fish, marine mammals, or at-risk amphibians directly, or through change in quality of habitat, or, human health.

If sediment-laden water reached the aquatic environment, the geographic extent of the effect would depend on the quantity of sediment-laden water released relative to the size of the receiving body, and potential for dispersion. With the implementation of the mitigation measures described above, the volume of sediment that could be released into the aquatic environment would likely be low and the extent of the effect would likely be local.

The magnitude of the effects of a low-volume sediment release is anticipated to be low. The release of a low volume of sediment-laden water into watercourses within the Project alignment would not be expected to result in a noticeable effect over baseline conditions, given the natural variability of suspended sediment with the river seasonally and annually (**Section 4.1 River Hydraulics and River Morphology**), and the quality of the upland watercourses.

The duration of the effect is anticipated to be short-term as sediment that may be released during Project construction or maintenance activities would be expected to be contained or dissipated quickly. The frequency of a release of sediment-laden water is anticipated to be uncommon. Considering the existing variability of sediment levels in the Fraser River and the

unlikely disturbance of CRA fish habitat or at-risk amphibians in road side ditches after mitigation measures have been applied, the effect is anticipated to be reversible, with baseline conditions naturally restored after the disturbance has ceased.

The consequence of the failure of a culvert, ditch, or containment structure is low given that the effects are predicted to be localized, low in magnitude, and reversible over the short-term.

Risk Conclusion

The likelihood and consequence of a sediment release into the environment is anticipated to be low given the controls and preventative measures that are required to be in place. The mitigation measures outlined are well-established industry standards that have been proven effective at managing localized flooding, erosion, sedimentation, or discharge of deleterious materials into the aquatic environment. With the implementation of mitigation, the likelihood and consequence of residual adverse effects is considered to be low. Therefore, the potential event is considered to be of low risk.

A summary of residual effects resulting from localized flooding, erosion, sedimentation, or discharge of deleterious materials into the environment is presented in **Table 8.3-2** for those VCs where an interaction may occur. The more detailed VC-specific definitions for magnitude, extent, duration, frequency, and reversibility are presented in **Section 4.0 Environmental Effects Assessment** to **Section 7.0 Health Effects Assessment**, and are used in cases where they are relevant for both the Project effects assessment and for the accident or malfunction effects assessment.

Table 8.3-2 Effects of Failure of Containment Structures

| Valued Component | Residual Effects Criteria | | | | | | Consequence | Likelihood | Risk |
|-----------------------|---------------------------|-----------|--------|------------|-----------|---------------|-------------|------------|------|
| | Direction | Magnitude | Extent | Duration | Frequency | Reversibility | | | |
| Fish and Fish Habitat | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| At-risk Amphibians | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |
| Marine Mammals | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |

8.3.3 Damage to Utilities

The Project alignment accommodates a number of underground utilities such as electricity, sewage, water, natural gas, jet fuel or telecommunications, and there is a potential for accidental damage of these utilities during Project construction or maintenance activities involving ground disturbance (e.g. excavating, trenching, pile driving, ground improvements). Damage of utilities may cause disruption of municipal services for residential, commercial, or industrial users. Utility damage involving a spill of waste water or chlorinated water could also affect fish and fish habitat, marine mammals, or at-risk amphibians if such spills enter the aquatic environment. An accidental breach in the integrity of a natural gas pipeline could have potential health and safety implications.

Mitigation Measures

Prior to the start of construction or maintenance activities involving ground disturbance, underground utilities within the Project alignment will be located and mapped. Locating and mapping underground utilities on detailed design drawings will minimize the likelihood of unexpected disruption.

Contractors will be required to contact BC One Call, a central agency that helps identify buried underground utilities and facilities, in advance of any ground works.

In the event of a disruption to underground utilities, the municipality and the relevant utility will be contacted immediately and response will proceed as set out in the CEMP.

Likelihood

Due to the standard nature of construction methods envisaged and the use of appropriate mitigation measures, including the proper identification and protection of utilities prior to construction, the likelihood of accidental damage to utilities resulting in adverse effects to VCs is considered remote.

Consequence

Any disruption of utilities is expected to be addressed in an effective, timely manner through the implementation of the CEMP. This will ensure that potential effects of such incidents are localized in extent, temporary in duration, and minimal in consequence. The consequence of accidental damage to a utility is anticipated to be low to moderate, depending on the type of utility damaged and the extent of the damage.

Risk Conclusion

Proposed mitigation measures are anticipated to reduce the likelihood of utility damage during construction and maintenance, and the consequence of any unlikely incident. With mitigation, the likelihood of residual adverse effects is considered remote. The potential consequence of damaging utilities during construction is likely to be low after implementation of proposed mitigation. The potential risk associated with accidental damage of utilities during Project construction and maintenance is considered to be low. Given the low risk involved, and the remote nature of likelihood of such and effect occurring, an assessment of potential effects of an accident or malfunction involving utility disruption is not considered necessary.

8.3.4 Marine Vessel Collision

During construction of the Project, there will be marine vessels and marine-based equipment stationed near the Project and travelling to and from the Project, depending on location of staging areas. A marine-based vessel or equipment collision with another marine-based vessel or equipment (Project-related or non-Project-related) during construction has the potential to disturb navigation in and around the area of the incident.

The potential for a marine vessel collision during operations is very rare and would require marine-based maintenance activities to be occurring such that the location, timing, and duration could affect other vessels or equipment. Navigational clearances for the proposed new bridge have been developed in accordance with the requirements of Transport Canada (Navigable Waters Protection Division). Proposed vertical and horizontal navigational clearances are described in **Section 1.1 Description of Proposed Project**. Project maintenance will be primarily land or structure-based; the potential for marine based maintenance activities to occur during Project operations is considered very rare and therefore not discussed further.

Mitigation Measures

Mitigation measures to reduce the likelihood and consequence of disturbance to marine use and navigation will include the following:

- Training will be mandatory for all contractors and equipment operators to understand and adhere to a Marine Access Management Plan during construction activities to avoid collision or interference with other marine users, marine vehicles, and marine equipment related and unrelated to the Project.

- Signage requirements will be determined and will be described in the Marine Access Management Plan, prior to commencement of marine-based activities.
- Avoiding work during adverse marine conditions (e.g., fog) where possible, and include speed restrictions during inclement weather, for inclusion in the Marine Access Management Plan.

Likelihood

The potential of a marine vessel collision resulting in obstruction to navigation is considered low given the mitigation measures in place, including operator training, and high-visibility marking of construction areas.

Consequence

In the unlikely scenario of a marine vessel collision resulting in obstruction to navigation, marine use could be affected. The geographic extent of the effect is anticipated to be local. The magnitude and duration of obstruction to navigation due to a marine vessel collision would likely be of low magnitude, and over short duration, given the mitigation measures in place.

The frequency of a marine vessel collision resulting in unintended obstruction to navigation is anticipated to be uncommon given implementation of the Marine Access Management Plan, including operator training, high-visibility marking of navigation and construction areas.

The effect is anticipated to be reversible after the disturbance has ceased. The consequence of a marine vehicle collision resulting in unintended obstruction to navigation is assessed to be low given that the effects are predicted to be low in magnitude, localized, temporary in duration, and reversible over the short-term. Any disturbance to marine use is expected to be addressed in an effective, timely manner through the implementation of the Construction Traffic Management Plan.

Risk Conclusion

The mitigation measures outlined above are standard practice in the industry and have been proven effective. The Construction Traffic Management Plan will include a communication program informing marine users of activities and schedules of construction within (and to/from) the Project. This is expected to effectively reduce the likelihood and consequence of disturbance to marine use from a marine vessel collision resulting in obstruction to navigation. The confidence in this assessment is high, since the assessment is based on well-documented cause-effect relationships.

It is unlikely that a marine vessel collision will disturb marine use. Given the implementation of mitigation measures, the consequence of such an accident is anticipated to be low, resulting in a risk rating of low.

A summary of residual effects resulting from marine vessel collision resulting in obstruction to navigation and the potential interactions with VCs is presented in **Table 8.3-3**. The more detailed VC-specific definitions for magnitude, extent, duration, frequency, and reversibility are presented in **Section 5.0 Socio-economic Effects Assessment**, and are used in cases where they are relevant for both the Project effects assessment and for the accidents and malfunction effects assessment.

Table 8.3-3 Effects of Marine Vehicle Collision and Unintended Obstruction to Navigation

| Valued Component | Residual Effects Criteria | | | | | | Consequence | Likelihood | Risk |
|------------------|---------------------------|-----------|--------|------------|-----------|---------------|-------------|------------|------|
| | Direction | Magnitude | Extent | Duration | Frequency | Reversibility | | | |
| Marine Use | Adverse | Low | Local | Short-term | Uncommon | Reversible | Low | Low | Low |

8.3.5 Structural Failure of Project Components

The new bridge, interchanges, and associated infrastructure will be designed and built to withstand collision from vehicles without sustaining structural damage. Parapets and railings will be designed to prevent vehicles from leaving the roadway, as set out in *CSA S6-14 Canadian Highway Bridge Design Code* and the *Ministry's Bridge Standards and Procedures Manual–Volume 1, Supplement to CHBDC S6-06*. The potential for Project malfunctions resulting from structural failure during Project operations is therefore considered remote. An overview of measures that will be implemented to ensure that potential structural failure is avoided, and resulting consequences are minimized is presented below, along with a discussion on associated risk.

Mitigation Measures

The Project will be designed and constructed in accordance with federal and provincial standards to minimize the potential for damage resulting from structure failure, including the *CSA S6-14 Canadian Highway Bridge Design Code* and the Ministry's *Bridge Standards and Procedures Manual–Volume 1, Supplement to CHBDC S6-06*.

The Ministry's maintenance contractors are required to respond to structural damage as set out in Chapter 7-800 (Structure Damage Response) of the Ministry's *Maintenance Specifications*. In general, the objective of the response is to ensure the safety of highway users, to restore all affected structures to their original condition, and to maximize their functional life (B.C. MOT 2003). Where the safety of highway users is affected, the Ministry maintenance contractors must immediately notify the Ministry so a Bridge Structural Engineer may make an inspection. If determined that there is a risk of structural failure under loading, the bridge may be load restricted or closed to all traffic or uses, and the bridge repaired to a safe and stable condition.

In the event of a structural failure, priority will be given to ensuring the stability of the highway and the safety of highway users. Once public safety is assured, Ministry contractors are required to take the necessary steps to reduce the risk posed by debris or other materials to the drainage system, riparian areas, and watercourses. The removal of such debris will commence as soon as possible, in consultation with Ministry of Environment, Ministry of Forests, Lands and Natural Resource Operations, and Department of Fisheries and Oceans, as applicable. During debris removal activities, measures will be implemented to prevent sediment and other deleterious materials from entering road drains and watercourses.

Likelihood

The likelihood of a structural failure involving Project components is considered remote, given the strict regulation and standards that apply to the design, construction, and operation of major infrastructure.

Consequence

Design standards and the mitigation measures discussed above are expected to ensure that potential consequences of any structural failure are minimized. Potential consequence to human health and safety in an unlikely event involving structural failure of a Project component is considered to be low, given the design, construction, and maintenance specifications and requirements of the proposed structures. The potential consequence of the failure of a Project component to VCs is considered to be low to medium.

Risk Conclusion

Based on the remote likelihood of an accident or malfunction resulting in the structural failure of a Project component during Project operations, and the low to medium consequence of such an incident on VCs, the risk associated with structural failure during operations is determined to be low. Given the low risk involved, and the remote nature of the likelihood of such an effect occurring, an assessment of potential effects of an accident or malfunction involving failure of a Project component during operations is not considered necessary.

8.4 Summary

During construction, adherence to the practices and procedures contained in the CEMP and sub-plans will minimize the potential for accidents and malfunctions to occur. As described in **Section 12.0 Management Plans**, the CEMP will be developed prior to Project construction and will include measures to be taken in the event of an environmental incident, in accordance with the Ministry's *2012 Standard Specifications for Highway Construction* (B.C. MOTI 2012). An Operation Environmental Management Plan (OEMP) will be developed upon Project completion, prior to commencement of the operation phase.

One of the key objectives of the Project is to improve safety within the Highway 99 corridor. The improvements in traffic and transportation conditions that are anticipated to result from the Project are expected to lower the potential for accidents or malfunctions to occur during Project operation, compared to existing conditions.

The preventative measures that will be in place to avoid or mitigate potential environmental effects resulting from an accident or malfunction during Project construction and operation have been outlined in this section. More prescriptive response efforts and activities that will be implemented in the event that an accident or malfunction occurs, despite the preventative actions taken, will be described in the applicable management plans that will be developed prior to construction.

The likelihood, consequence, and risk for each event described, with implementation of the design and management objectives and mitigation measures described in the preceding sections are summarized in **Table 8.4-1**.

Implementation of effective Project design and management specifications and mitigation measures is expected to minimize the likelihood, and avoid or reduce the consequence of potential accidents and malfunctions that could occur during Project construction and operation. Potential risks associated with all potential Project-related accident or malfunction scenarios are expected to be low.

Table 8.4-1 Summary of Risk for Accidents and Malfunctions

| Section | Accident or Malfunction Scenario | Project Phase ¹ | Likelihood | Consequence | Risk ² (after mitigation) |
|---------|--|----------------------------|------------|-----------------|--------------------------------------|
| 8.3.1 | Release or spill of toxic or hazardous materials | C O | Low | Low | Low |
| 8.3.2 | Structural failure of containment structures | C O | Low | Low | Low |
| 8.3.3 | Damage to utilities | C O | Remote | Low to Moderate | Low |
| 8.3.4 | Marine vehicle collisions | C | Low | Low | Low |
| 8.3.5 | Structural failure of Project components | O | Remote | Low to Moderate | Low |

Notes: ¹C = construction phase; O = operation phase, which includes maintenance

² Risk evaluation considers the interaction of likelihood and consequence as described in **Section 8.2.2.**

9.0 Effects of the Environment on the Project

This section presents the results of a review of environmental factors deemed to have possible consequences for the Project. The following factors were considered in this review: extreme weather, seismic events, erosion and scour, fire, extreme flood events, and climate change. Effects that may be caused by these factors, and their likelihood and consequence for relevant VCs, are described. Practical mitigation measures, including design strategies and environmental management plans, to avoid or minimize the likelihood and consequence of the effects of the environment on the Project are identified and a conclusion on the potential risk of an effect of the environment on the Project and to relevant VCs is provided.

Likelihood and Consequence

Likelihood is the probability of the event actually occurring while consequence is a measure of the severity and magnitude of the potential effects. Likelihood and consequence are each qualitatively ranked. Definitions for ranks and levels are provided in **Table 9-1**. Likelihood ranges from remote to very high; consequence ranges from very low to very high.

Table 9-1 Definitions for Categories of Likelihood and Consequence

| | Category | Description |
|------------------------------------|-----------|--|
| Likelihood Post-Mitigation | Remote | Event could occur only in exceptional circumstances. |
| | Low | Event not likely to occur in normal circumstances. Expected to occur less than once every five years. |
| | Moderate | Event could occur at some point. Expected to occur once in every three to five years. |
| | High | Event will probably occur in most circumstances. Expected to occur once in one to three years. |
| | Very high | Event is expected to occur in most circumstances and has a history of occurrence. Expected to occur once or more per year. |
| Consequence Post-Mitigation | Very low | Effects are localized and short-term in duration. Recovery is anticipated within days or weeks. |
| | Low | Effects are localized and short-term in duration. Recovery is anticipated within 20 years of occurrence. |
| | Moderate | Effects are widespread. Recovery is anticipated within 20 years of occurrence. |
| | High | Effects are widespread. Recovery is not anticipated within 20 years of occurrence. |
| | Very high | Effects cause a loss of a considerable portion of a VC. |

Risk

Risk was determined using a risk evaluation matrix (**Table 9-2**), adapted for the Project from the Risk Management Guideline for the B.C. Public Sector document (B.C. Risk Management Branch and Government Security Office 2012). The level of risk associated with an event depends on the potential consequence and the likelihood of occurrence (see **Table 9-2**). For example, an event is considered very high risk if the likelihood and the consequence of the event post-mitigation are very high.

Table 9-2 Risk Evaluation Matrix

| Likelihood Post- Mitigation | Consequence Post-Mitigation | | | | |
|-----------------------------|-----------------------------|--------|----------|-----------|-----------|
| | Very low | Low | Moderate | High | Very high |
| Very High | Low | Medium | High | Very High | Very High |
| High | Low | Medium | High | High | Very High |
| Moderate | Low | Low | Medium | High | High |
| Low | Low | Low | Medium | Medium | Medium |
| Remote | Low | Low | Low | Low | Medium |

9.1 Extreme Weather

The Project is located within the Coastal Western Hemlock dry maritime biogeoclimatic sub-zone (CWHdm), which is characterized by warm summers and moist, mild winters with rare cases of snow (Green and Klinka 1994). Although the climate is generally consistent among seasons, there are rare cases of climate extremes. Severe climatic events that may affect the Project include heavy precipitation including snow, ice, high winds, and extreme temperatures.

The average and extreme precipitation data, collected from Environment Canada’s Richmond Nature Park Climate Station and the Delta Tsawwassen Beach Climate Station from 1981 to 2010, are summarized on **Table 9.1-1**. These climate stations have been selected to represent the extreme weather scenarios that could occur in and around the Project. The majority of the annual precipitation within the Project area is rain, which occurs regularly between October to March, along with occasional, short-duration snow events.

Table 9.1-1 Average and Extreme Weather Data from 1981 to 2010

| Parameter | Richmond Nature Park Climate Station | Delta Tsawwassen Beach Climate Station |
|----------------------------------|--------------------------------------|--|
| Average temperature (°C) | 10.6 | 11.1 |
| Extreme maximum temperature (°C) | 34.5 (1983) | 31 (1988) |
| Extreme minimum temperature (°C) | -16.5 (1978) | -12.0 (1989) |
| Annual rainfall (mm) | 1227.8 | 899.9 |
| Extreme daily rainfall (mm) | 93.8 (2003) | 88.2 (2003) |
| Annual total snowfall (cm) | 24 | 28 |
| Median snow depth (cm) | 0 | 0 |
| Extreme daily snowfall (cm) | 24 (1998) | 39 (1996) |

Source: Environment Canada (2014)

Higher-than-average precipitation levels could increase flood potential (**Section 9.5 Extreme Flood Events**) and cause erosion (**Section 9.3 Erosion and Scour**) within the Project alignment during construction or operation.

Wind data from the climate station at the Vancouver International Airport was used to represent local conditions. Over the course of a typical year, wind speeds vary from 0 km/h to 42 km/h (light air to moderate breeze), rarely exceeding 52 km/h (high wind).

Potential Effects on the Project and Valued Components

Potential effects of extreme weather events on the Project include the following:

- From heavy precipitation events, increased erosion potential, flooding, and decreased slope stability.
- Damage to roads, structures, and drainage facilities from high winds and heavy rain, resulting in untreated runoff and debris entering watercourses or terrestrial habitat.
- Accidents and malfunctions, triggered by extreme weather events, resulting in release of deleterious or toxic substances into terrestrial or aquatic habitats (**Section 8.0 Accidents and Malfunctions**).
- Adverse driving conditions, leading to increased potential for accidents during heavy rain, snow, fog, and high-wind events, potentially resulting in spills or release of toxic substances into terrestrial or aquatic habitats.

Effects of extreme weather events on the Project, as listed above, could have the following implications for valued components:

- Fish and fish habitat and at-risk amphibians may be affected by untreated runoff and debris entering watercourses.
- Fish and fish habitat, at-risk amphibians, marine mammals, and terrestrial wildlife may be affected by the release or spill of deleterious or toxic substances.
- Marine use may be affected by debris entering the Fraser River.
- Land use may be affected by flooding.

Mitigation Measures

The Project will be designed and constructed in accordance with federal and provincial standards to minimize the potential for structural damage resulting from extreme weather. Applicable design standards and directives include the *Canadian Highway Bridge Design Code* (CSA 2010), the Ministry's *Bridge Standards and Procedures Manual* (B.C. MOT 2007), the Ministry's 2012 *Standard Specifications for Highway Construction* (B.C. MOTI 2012) and the Ministry's Technical Circular T-06/15 Climate Change and Extreme Weather Event Preparedness and Resilience in Engineering Infrastructure Design.

Specifically, the following measures will be in place to reduce the likelihood and mitigate the consequence of effects of extreme weather events:

- The river bank will be enhanced or reinforced where required to support Project components, providing protection against extreme weather events, erosion, and flooding.
- The Project will be designed to withstand extreme rainfall through stormwater management and drainage infrastructure.
- Upland drainage ditches will be designed to withstand storm events adjusted for climate change.
- The new bridge will be designed to mitigate potential functionality issues that could occur during snow and ice events.
- The Project will be designed to withstand maximum wind conditions.

Likelihood and Consequence of Potential Effects

Weather in the Project area is stable through most of the year with rare occurrences of extreme conditions. The Project will be designed and constructed to withstand extreme events, and provide safe movement of vehicles across the new bridge and along the upgraded highway during extreme weather conditions.

With mitigation applied to prevent, avoid, or reduce extreme weather effects, including design, construction, operation, and maintenance standards, the likelihood and consequence of an extreme weather-related effect is considered to be very low. Appropriate maintenance and management procedures will be in place to avoid or minimize environmental consequences of extreme weather events on valued components.

Conclusions on Potential Risk

Potential effects of extreme weather events on the Project will be considered during design, construction, and operation of the Project. Mitigation measures will be designed and implemented to avoid or reduce potential adverse effects of the environment on the Project, and subsequent effects on valued components. The overall risk to the Project from extreme weather events, during either construction or operation, is considered to be very low.

9.2 Seismic Events

The Lower Mainland is within one of the most seismically active areas of Canada. Approximately 4,000 earthquakes are recorded each year in Canada, half of which occur off the coast of B.C. (NRC 2011). Seismic activity occurs when tectonic plates move apart, slide past one another, or collide. This activity results in small earthquakes (occurring daily), larger, potentially damaging earthquakes (occurring decades apart), and some of the world's largest earthquakes (occurring centuries apart).

The largest earthquakes that have occurred in the region in the past several decades include a magnitude 6.8 event in Washington State in 2001, a magnitude 6.5 event near Seattle-Tacoma, Washington in 1965, and a magnitude 7.3 event near Campbell River, B.C. in 1946. Geological evidence indicates that great (magnitude 8 to 9) earthquakes strike the B.C. coast every 200 to 850 years. The most recent great event occurred over 300 years ago (January 26, 1700).

Potential Effects on the Project and Valued Components

Depending on the distance from the Project, a large earthquake could result in structural damage to the Project, which may include:

- Ground deformations, embankment approach fill deformation, structural change to the new bridge and soil liquefaction, resulting in structural damage to the new bridge, roads, banks, and dikes.
- Increased potential for erosion, scour, or flooding (**Sections 9.1 Extreme Weather and 9.5 Extreme Flood Events**).
- Increased potential for accidents and malfunctions, resulting in debris and toxic or deleterious substances entering a watercourse (**Section 8.0 Accidents and Malfunctions**).

Effects of a seismic event on the Project, as listed above, could have the following implications for valued components:

- The bridge may be temporarily out of service.
- Traffic may be affected by delays in movement or change in accessibility of traffic routes
- Marine use may be affected by debris entering the Fraser River.
- Fish and fish habitat, at-risk amphibians, marine mammals, and wildlife may be affected by toxic or deleterious substances entering watercourses.
- Land use may be affected by ground deformations, soil liquefaction, erosion, scour, or flooding.

Mitigation Measures

One of the key objectives of the Project is to improve safety within the Highway 99 corridor. The Project will be designed, constructed, and operated in accordance with the latest *Canadian Highway Bridge Design Code* (CSA 56-14), and other applicable and current seismic design codes from the United States and Europe. These design codes serve as models to help provincial and territorial authorities ensure that structures are engineered to the level of earthquake hazard for the applicable seismic zone. The Project will result in a safer travel corridor that will withstand seismic activity in an improved capacity compared to existing conditions (i.e., the Tunnel). Specifically, the following measures will avoid or minimize the likelihood and consequence of potential effects of seismic events on the Project:

- Ground improvements will be undertaken prior to construction, allowing the Project components, including the new bridge, to be built on densified ground, which is less susceptible to liquefaction in the event of seismic activity.
- The new bridge will be constructed as a Lifeline Structure. In the event of an earthquake, a Lifeline Structure will:
 - Sustain no damage and remain open to all traffic following an earthquake with a 1-in-475-year return period seismic event.
 - Sustain minimal damage following a 1-in-975-year return period seismic event.
 - Sustain repairable damage resulting in limited service following a 1-in-2,475-year return period seismic event.

Likelihood and Consequence of Potential Effects

The likelihood that a seismic event could affect Project infrastructure resulting in adverse effects to the environment is remote, given the design of the new bridge as a Lifeline Structure. The consequence of the effects of a major (i.e., 7 magnitude or greater) seismic event could be high, depending on the scale of the event and associated damage.

Public safety, emergency routes and access, and structure stability will be improved compared to the current situation within the Highway 99 corridor. Specifically, the new bridge will be safer in the unlikely event of a large-scale earthquake, and will be designed to better withstand a seismic event.

Conclusions on Potential Risk

Large-scale seismic events could potentially affect the Project; however, the likelihood of such events occurring is remote. In addition, the potential consequence of the event will be mitigated through Project design which will improve public safety, emergency routes and access, and structure stability compared to the current situation within the Highway 99 corridor. The overall risk to the Project is considered to be very low.

9.3 Erosion and Scour

Erosion occurs when flowing water removes soil particles or a mass of material from the bank of a waterbody. Waterbodies within the Project alignment include the Fraser River South Arm, Deas Slough, Green Slough, and smaller roadside waterbodies/ditches along the Highway 99 corridor. The banks along Fraser River South Arm are well established and support the existing water and sediment flows.

Scour refers to lowering of a channel bed below its normal level. Bathymetric survey data collected for the Fraser River South Arm in 2014 (**Section 4.1 River Hydraulics and River Morphology**) show the areas of periodic scour and subsequent fill that currently occur within the river channel.

Potential Effects on the Project and Valued Components

Potential effects of erosion and scour on the Project and the subsequent effect on the environment include decreased slope stability or bank failure at bridge support areas, resulting in sediment entering a watercourse and temporary effects to water quality.

These erosion and scour effects could cause changes to the following valued components:

- Fish and fish habitat through temporary changes in water quality
- Marine use through debris entering the Fraser River

Mitigation Measures

The Project will be designed, constructed, and operated in a manner that anticipates and addresses potential adverse effects of erosion and scour on the Project. The following measures will be taken to avoid or minimize the likelihood and consequence of scour and erosion on Project components:

- The new bridge will be a clear span; bridge piers will not be located within the Fraser River South Arm.
- Banks within the Project alignment will be reinforced and protected where required to support construction and operation of the new bridge, reducing the potential for erosion to occur.
- Upland drainage ditches will be designed to withstand storm events adjusted for climate change, minimizing the potential for runoff to result in erosion of roadside watercourses and the river banks.
- River banks and dikes that are altered or otherwise affected by Project components will be re-established or stabilized to meet provincial and municipal requirements.
- The Project's CEMP and OEMP (**Section 12.0 Management Plans**) will be implemented to mitigate likelihood and manage the consequence of erosion and sediment control events.

Likelihood and Consequence of Potential Effects

There are no Project components that, even if subject to scour or erosion, could release potentially deleterious substances or otherwise affect the environment or human health. In this context, the likelihood that scour or erosion could affect Project infrastructure resulting in adverse environmental effects is considered to be remote.

Appropriate maintenance and management procedures will be in place to avoid or minimize environmental consequences of the effect of erosion and scour on the Project valued components, including fish and fish habitat. With the implementation of the design and construction mitigation, the consequence of the effects of erosion and scour on the Project affecting the environment is considered to be very low.

Conclusions on Potential Risk

The potential effects of erosion and scour on the Project will be considered during design, construction, operation, and maintenance of the Project. Mitigation measures will be implemented to avoid or reduce adverse effects of the environment on the Project and potential subsequent effects on valued components. The overall risk to the Project from erosion and scour events, during construction or operation, is considered to be very low.

9.4 Fire

The Project is located in an urban setting with a high percentage of impermeable surfaces and waterbodies (i.e., the Fraser River). Vegetated areas within the Project alignment are limited and include mowed and maintained strips adjacent to the Highway 99 corridor, Deas Island Regional Park, and the Richmond Nature Reserve. Metro Vancouver manages Deas Island Regional Park and imposes use and activity restrictions based on fire rating advisories, which reduces the potential for a wildfire to occur.

Potential Effects on the Project and Valued Components

The probability of a wildfire occurring within the Project alignment, remaining unaddressed, and becoming of a magnitude great enough to result in structural damage to the Project, is extremely unlikely. Potential effects of this scenario resulting in adverse effects to valued components are not expected. Emergency response measures that will be developed for implementation during Project construction and operation are described in **Section 12.0 Management Plans**.

Likelihood and Consequence of Potential Effects

Given its setting within a fully developed urban area in the vicinity of the Fraser River, the likelihood of an uncontrolled fire occurring within the Project alignment and resulting in damage to the Project and subsequent effects on the environment is considered to be remote. The consequences associated with the event are considered to be very low.

Conclusions on Potential Risk

The overall risk to the Project from wildfire, during either construction or operation, is considered to be low.

9.5 Extreme Flood Events

The Project is located within the City of Richmond and the Corporation of Delta. Richmond is situated within a river delta featuring rich, alluvial soils, and is only one metre above sea level, making it susceptible to flooding during high tide or a high spring freshet (City of Richmond 2013). Delta is similarly susceptible to flooding. It is less than 1.5 m above mean sea level, occupies part of the alluvial deposit created by the Fraser River, and is bordered by water on three sides (the Fraser River South Arm to the north, the Strait of Georgia to the west, and Boundary Bay to the south).

Floods can occur during spring freshet, extreme weather events, or a combination of both. Flooding during spring freshet occurs when higher-than-normal snow packs combine with warmer-than-normal weather, resulting in a rise in river discharge. Historically, the highest Fraser River freshets occurred in 1894, 1948, and 1972 (Environment Canada 2014).

Richmond and Delta are surrounded by dikes that have been built higher than the highest-ever-recorded water level at this location on the Fraser Basin (which occurred in 1894) and are designed to withstand a 1-in-200-year flood event.

Richmond has a dike network that extends over 49 km, protecting more than 12,000 ha from flooding (City of Richmond 2013). Over 60 km of sea dikes and riverbank dikes surround the entire lowland area of Delta, protecting the community from high water levels along the Fraser River, the Strait of Georgia, and Boundary Bay (Corporation of Delta 2014).

In addition to the dike networks protecting these communities, Richmond and Delta have extensive ditch, drainage, canal, culvert, and sewer networks that manage the high volumes of water experienced during times of extreme precipitation. These systems are designed to accommodate a 1-in-100-year storm event. Elevated roads and highways such as Deltaport Way, Highway 17, and Highway 99 also provide secondary flood protection. Flooding as a result of climate change and sea-level rise is discussed in more detail in **9.6 Climate Change**.

Potential Effects on the Project and Valued Components

The potential effects of an extreme flood event on the Project and the subsequent environmental effects that may result include:

- Decreased slope stability due to erosion, washout, or dike breach, resulting in runoff and debris entering watercourses or terrestrial habitat.
- Damage to roads, structures, and drainage and stormwater facilities, resulting in untreated runoff and debris entering watercourses or terrestrial habitat.

These flood event effects could cause changes to the following valued components:

- Fish and fish habitat and at-risk amphibians may be affected by changes in water quality.
- Agricultural use may be affected by untreated runoff.

Mitigation Measures

Mitigation measures proposed to reduce the likelihood and consequence of flood events on the Project include the following:

- Incorporate dike reinforcement and bank protection where required into the Project design, to maintain the integrity of the dike and to reduce the potential for erosion at the new bridge footings and support components.
- Upland drainage ditches will be designed to withstand storm events adjusted for climate change.
- Develop a CEMP and an OEMP, which will include an Emergency Response and Spill Contingency Plan and an Erosion and Sediment Control Plan. These plans will describe the mitigation to be implemented to protect the Project in the event of a structural failure of a Project component, and sedimentation and runoff management.

Likelihood and Consequence of Potential Effects

The existing dike system within the Project alignment has been designed to withstand extreme flood events, and the Project will be designed to incorporate bank reinforcement and protection. The likelihood of an extreme flood event resulting in damage to the Project and subsequent effects on the environment is considered to be remote. In addition, the Project design will include elements that minimize the effects of extreme flooding on Project components, including increased erosion and stormwater runoff. With the implementation of the design and construction measures, the consequence of an extreme flood is anticipated to be very low.

Conclusions on Potential Risk

The potential effects of extreme flooding on the Project will be considered during design, construction, operation, and maintenance of the Project. Mitigation measures will be implemented to avoid or reduce adverse effects of the environment on the Project and potential subsequent effects on valued components. The overall risk to the Project from an extreme flood, during either construction or operation, is considered to be very low.

9.6 Climate Change

The general effects of climate change that could affect the Project include temperature rise, increased precipitation, more intense storms, and sea-level rise. The following sections discuss the forecasted effects of climate change and the potential effect of climate change on the Project.

Temperature Rise

Historical temperature data for the south coast of B.C., as analyzed by the Pacific Climate Impacts Consortium (PCIC), indicates that a rise of approximately one degree Celsius ($^{\circ}\text{C}$) has occurred within the 20th century, in all seasons (PCIC 2013). By the 2050s, a mean temperature rise of 1.7°C from the 1961 to 1990 baseline has been predicted. Summer temperatures are projected to rise slightly more than other seasons, at 2°C by the 2050s, and 3.1°C by the 2080s (PCIC 2013).

Precipitation

The mean seasonal precipitation for the regional area peaks at approximately 440 mm during the winter months (PCIC 2013). A modest increase of 10% in precipitation was projected by the 2080s by PCIC for all seasons except for the summer months, in which a 10% decrease was predicted. By the 2050s, snowfall is predicted to be reduced by half in the spring and by 24% during the winter (PCIC 2013).

Higher intensities of precipitation could lead to increased flooding, particularly in areas that are already vulnerable to flooding. Recent studies conducted by B.C. Ministry of Environment have indicated that the 1-in-200-year to 1-in-500-year size flood may occur as often as every 50 years (B.C. MOE 2014a). More information on potential effects of extreme precipitation or flooding is provided in **Sections 9.1 Extreme Weather** and **9.5 Extreme Flood Events**.

Sea-level Rise

By 2100, sea-level rise at the Fraser River delta is predicted to range from 50 cm to a possible extreme level of 120 cm in some areas (B.C. MOE 2008, 2014a, b). With higher sea levels, storm surges can reach greater heights and potentially spread further inland (ICF International 2010). Coupled with more intense storm surges and flooding events in the Fraser River delta, higher sea levels could result in higher potential for erosion or washout of road bases, overwhelming of stormwater infrastructure, and reduction in clearance under the bridge (ICF International 2010).

Potential Effects on the Project and Valued Components

The primary potential effects of climate change that could influence the Project are storm intensity and flooding associated with sea-level rise, coupled with high river flows or high tides in the Fraser River. Additionally, increased occurrences of extreme weather events may lead to more severe, extreme precipitation and drought, resulting in alterations in watercourse flows, thereby potentially affecting Project infrastructure.

These climate change-related effects could in turn affect valued components as follows:

- Fish and fish habitat, marine mammals, or at-risk amphibians may be affected by changes in water quality.
- Agricultural use and land use may be affected by flooding.
- Marine use may be affected by debris entering the Fraser River.

Mitigation Measures

The Project will be designed and constructed in accordance with federal and provincial standards and directives to minimize the potential for structural damage resulting from extreme weather, including the *Canadian Highway Bridge Design Code* (CSA 56-14), the Ministry's *Bridge Standards and Procedures Manual* (B.C. MOT 2007), and the Ministry's 2012 *Standard Specifications for Highway Construction* (B.C. MOTI 2012) and the design will be based in accordance with the Ministry's T-06/15 Circular on climate change (see **Section 1.1.6 Project Design Considerations** for more details). The Project incorporates several design requirements that account for climate change. For example the new bridge design incorporates the provincially recommended additional clearance of one metre to account for the anticipated effects of sea level rise. Additionally, potential increases in storm intensity due to climate change will be reflected in ditch, culvert, and retention pond design. The Project will result in a safer travel corridor that will better withstand extreme weather compared to existing conditions. The mitigation described in **Sections 9.1 Extreme Weather, 9.3 Erosion and Scour, and Section 9.5 Extreme Flood Events** above address the potential effects of erosion and scour, extreme weather, and flood events on the Project, which would also apply to the potential effects of temperature rise, increased precipitation, and sea-level rise on the Project. Moreover, the vessel navigational clearance requirements for the new bridge will include consideration of potential sea level rise resulting from climate change.

Likelihood and Consequence of Potential Effects

The likelihood of climate change affecting the Project and resulting in an adverse effect on the environment is low. Appropriate maintenance and management procedures will be in place to avoid or minimize environmental consequences of climate change on the Project valued components. With the implementation of the design, construction, and operation phase measures, the consequence of the effects of climate change on the Project affecting the environment is considered to be very low.

Conclusions on Potential Risk

The potential effects of climate change on the Project will be considered during design, construction, operation, and maintenance of the Project. Mitigation measures will be implemented to avoid or reduce adverse effects of the environment on the Project and potential subsequent effects on valued components. The overall risk to the Project from climate change, during either construction or operation, is considered to be very low.

Part C – Aboriginal Consultation

10.0 Aboriginal Consultation

- Aboriginal Interests, defined as asserted or determined Aboriginal rights, including title, and treaty rights, are known to overlap or lie in the vicinity of the Project corridor.
- Potential effects on Aboriginal Interests were described through consideration of four indicators:
 - Access to preferred locations for the exercise of Aboriginal Interests;
 - Availability of preferred resources for the exercise of Aboriginal Interests;
 - Quality of preferred resources for the exercise of Aboriginal Interests; and
 - Quality of experience in exercising, or tied to the exercise of, Aboriginal Interests.
- Mitigation measures to address potential Project-related effects on intermediate components (ICs) and valued components (VCs) associated with the exercise of Aboriginal Interests are expected to be effective.
- Potential effects on the exercise of Aboriginal Interests are predicted to be negligible following mitigation to address potential effects on ICs and VCs except for:
 - Potential temporary effect on access related to instream construction activities for some groups and a potential effect on quality of experience (i.e., cultural heritage) tied to traditional uses dependent on that access
 - Potential temporary effect during construction on quality of experience related to construction-related noise and quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to sensory disturbance
 - Potential effect on quality of experience (i.e., cultural heritage) during operations tied to traditional uses due to visual and noise disturbance to the cultural landscape

Additional measures have been identified to address potential residual effects on Aboriginal Interests include:

- Ongoing consultation regarding proposed measures, management plans, and monitoring programs related to intermediate components and valued components assessments; and
- Development of an Archaeological and Heritage Resources Management Plan.

With the implementation of mitigation proposed to address potential effects on ICs and VCs, as well as additional mitigation proposed to address potential residual effects on Aboriginal Interests, no residual effects on the exercise of Aboriginal Interests as a result of the Project, are expected.

10.0 Aboriginal Consultation

Aboriginal Interests, defined in the section 11 Order as asserted or determined Aboriginal rights, including title, and treaty rights, are discussed in **Section 10.1 Aboriginal Interests**. Issues raised by Aboriginal Groups that do not directly relate to Aboriginal Interests, such as those pertaining to potential adverse social, economic, heritage, or health effects, and proposed measures to address those effects, are presented in **Section 10.2 Other Matters of Concern to Aboriginal Groups**. The results of **Section 10.1.3 Aboriginal Interests Assessment** and **Section 10.2** are summarized in **Section 10.3 Issue Summary Table**.

Any statements in this Application regarding Aboriginal Groups are based on information provided by those Aboriginal Groups in the context of consultation on the Project, or as available in publicly available sources, and do not constitute admissions, acknowledgments or endorsements of the claims, positions, or accuracy of the information by the Province of British Columbia.

10.1 Aboriginal Interests

As set out in the section 11 Order for the proposed Project, issued by the Environmental Assessment Office (EAO) on March 7, 2016, the following Aboriginal Groups were identified as requiring consultation and invited to participate on the Working Group, and placed on Schedule B of that order (Schedule B Aboriginal Groups):

- Cowichan Tribes
- Halalt First Nation
- Katzie First Nation
- Kwantlen First Nation
- Lake Cowichan First Nation
- Lyackson First Nation
- Musqueam Indian Band
- Penelakut Tribe
- Hwlitsum¹
- Semiahmoo First Nation

¹ The section 11 Order states, in Schedule B: “EAO’s reference to the Hwlitsum is not intended to signify any change in the position that the Province may have taken in other contexts in relation to the duty to consult with this group.”

- Squamish Nation
- Stz'uminus First Nation
- Tsawwassen First Nation
- Tsleil-Waututh Nation

Four of the Aboriginal Groups named above – Cowichan Tribes, Halalt First Nation, Penelakut Tribe, and Stz'uminus First Nation – are affiliated as the Cowichan Nation Alliance.

The following Aboriginal Groups were identified in the section 11 Order as requiring notification, and placed on Schedule C of that order (Schedule C Aboriginal Groups):

- People of the River Referrals Office

Prior to the section 11 Order, the Ministry had received a deferral from the People of the River Referrals Office, which handles referrals for some member nations of the Stó:lō Tribal Council and Stó:lō Nation, as well as the six member nations of the Ts'elxweyeqw Tribe.

Structure of Section 10.1

Descriptions of each Schedule B Aboriginal Group's population, reserves or treaty lands and areas, traditional territory, land use planning and governance, and economic interests, are provided in **Section 10.1.1 Background Information**. Maps of Indian Reserves, Aboriginal communities, and traditional territories of Schedule B Aboriginal Groups relative to the Project area are presented in **Appendix 10-A**.

Consultation activities undertaken by the Ministry with each Schedule B Aboriginal Group during the pre-Application phase are described in **Section 10.1.2 Consultation Activities**.

As available from Schedule B Aboriginal Groups or publicly available sources, **Section 10.1.3 Aboriginal Interests Assessment** summarizes, for each Schedule B Aboriginal Group (and the Cowichan Nation Alliance collectively), relevant past, present, or desired future use information of pertinence to the exercise of identified Aboriginal Interests in the proposed Project area. An assessment of potential adverse effects of the proposed Project on the exercise of Aboriginal Interests of each Schedule B Aboriginal Group is also presented in **Section 10.1.3**, with full consideration of the findings of the IC and VC chapters in Part B of the Application that are relevant to Aboriginal Interests, including cumulative effects and follow up strategies.

Provided by the Ministry to each Schedule B Aboriginal Group for review and comment prior to the submission of the Application were: the background summaries for these groups presented in **Section 10.1.1.1** through **10.1.1.11**; maps of traditional territories presented in **Appendix 10-A**; and the baseline (“existing conditions”) summaries relating to past, present, and desired future use of Schedule B Aboriginal Groups presented in **Section 10.1.3**. The subsections for each Aboriginal Group note whether or not comments on these sections of the Application were received from that Aboriginal Group prior to submission.

10.1.1 Background Information

Aboriginal Regional Setting

The ancestral languages of the Schedule B First Nations—Halkomelem Salish, Northern Straits Salish, and Squamish Salish—belong to the Coast Salish language family, and more specifically the Central Coast Salish branch of that family.

There are three dialects of Halkomelem Salish -- Downriver, Upriver, and Island. Two of these dialects – Downriver and Island – are associated with Schedule B Aboriginal Groups, while the third, Upriver dialect is associated with Schedule C First Nations. Specifically, the Downriver dialect of Halkomelem, or *Həŋqəmihəŋm*, is the ancestral language of nations based on the Lower Mainland, and associated with Fraser River from its mouth to the Stave River – i.e., present-day Tsawwassen First Nation, Musqueam Indian Band, Tsleil-Waututh Nation, Katzie First Nation, and Kwantlen First Nation (FPHLCC 2016). The Island dialect of Halkomelem, or *Hul’q’umi’num*, is the ancestral language of nations based on southeastern Vancouver Island from north of Mill Bay to Qualicum, including Cowichan Tribes, Halalt, Lake Cowichan, Lyackson, Penelakut, and Stz’uminus (FPHLCC 2016); these groups are also associated with the Fraser River. The Upriver dialect of Halkomelem, or *Halq’eméylem*, is the ancestral language of the Stó:lō nations associated with the Fraser River from the Stave River to the lower Fraser Canyon (FPHLCC 2016), some of which are represented by the People of the River Referrals Office (i.e., Schedule C First Nations). Downriver and Upriver dialects have been collectively described as Mainland Halkomelem.

To the south of Halkomelem-speaking nations are speakers of Northern Straits Salish, including the Semiahmoo, who are associated with the *SEMYOME* dialect. Northern Straits Salish is sometimes referred to as *SENĆOTEN* or Sencot’en, which is the dialect now spoken by most Northern Straits speakers (FPHLCC 2016). To the north and west of Halkomelem-speaking nations, are speakers of Squamish Salish, or *Skwxwú7mesh sníchim*, spoken only by the Squamish Nation (FPHLCC 2016).

Central Coast Salish ties to the South Arm of the Fraser River and adjacent upland areas are reflected in, for example, named places, origin stories, transformation sites (where, long ago, ancestors were transformed into animals and natural features of the landscape), and life histories. Some of the place names in the vicinity of the Project area, along with variations in spelling based on Halkomelem dialect differences (with approximate orthography), are listed in **Table 10.1-1** and shown in **Appendix 10-A, Figure 10-1 Halkomelem Place Names along the Fraser River South Arm**. The variations in spelling may not be exhaustive for any given place name, and place names reported below may not reflect the full range of named places in the vicinity of the Project known to Aboriginal Groups.

Table 10.1-1 Halkomelem Place Names in the Vicinity of the Project

| Name | Meaning | Location | Reference |
|--|---|--|--|
| Not reported | Not reported | Bog in central Lulu Island | VAFFC 2011 |
| <i>Zuqtinus</i> <i>λ'eqtines</i> <i>λ'eqətines</i> <i>Tl'ektines</i> <i>Tl'uqtinus</i> <i>λ'eqtinəs</i> | "long chest" "long beach" "long river-bank" "long shore" | South shore of Lulu Island, spanning from opposite Deas Island to Tilbury Island, and potentially extending from Woodward's Landing (at the foot of No. 5 Road) to Ewen's Cannery (on the west end of Lion Island), in the area of the Tunnel crossing | MIB 1976, MBC1984, Suttles 2004, TFN et al. 2009b, HTG 2005a, Rozen 1985, TWN 2015, PMV 2015, CNA 2016 |
| <i>puʔxun'é-w'mux^w</i> <i>Pulhxuneewmuhw</i> <i>Pətxənéməx</i> <i>pətxəneməx^w</i> | "meadow flat" "meadow land" | South shore of Fraser River, just above Ladner, on or adjacent to the western aspect of Deas Island, in the vicinity of the Tunnel crossing | MIB 1976, MBC 1984, Suttles 2004, HTG 2005b, Rozen 1985, TWN 2015, PMV 2015 |
| <i>q^wəq^wəʔápətp</i> | "crabapple trees" | Site of St. Mungo's Cannery, on the south shore of the Fraser River, across from Annacis Island | MIB 1976, MBC 1984, Suttles 2004 |
| <i>suwq^weqsun'</i> <i>səw'q^wéqsən</i> <i>Suwqw'eqsun</i> | "drifting away point" | Southwestern side of Annacis Island | MIB 1976, Suttles 2004, HTG 2005b |
| <i>Ma'q^wem</i> | Not reported | Burns Bog | TFN et al. 2009b |

| Name | Meaning | Location | Reference |
|--|---|---|--|
| <i>spuʔxun</i> <i>Spu'xun</i> <i>spəʔxən</i> | "meadow" | Upland Delta area | MIB 1976, MBC 1984, Suttles 2004, Rozen 1985. TWN 2015, PMV 2015 |
| <i>scúlux^wqun</i> <i>sc'ələx^wqən'</i> <i>čičilex^wqen</i> <i>Sts'uluhwqun</i> <i>sčələx^wqəń</i> <i>Sčələxwqəń</i> | "go upstream" and "throat" | Ladner area / Ladner Reach / Ladner Landing | MIB 1976, MBC 1984, Suttles 2004, TFN et al. 2009b, HTG 2005b, TWN 2015, PMV 2015 |
| <i>q^wʔé'yum</i> <i>q^wíáy'əm</i> <i>Qwlheyum</i> <i>q^wʔəy'əm</i> <i>q'é'yum</i> | "driftwood place" "driftwood log" | South shore of Lulu Island, across from Shady Island | MIB 1976, MBC 1984, Suttles 2004, HTG 2005b, TWN 2015, PMV 2015 |
| <i>kwy-yowka</i> | Not reported | South shore of Lulu Island at Steveston, across from Shady Island | TWN 2015, PMV 2015 |
| <i>q^wúya'x^w</i> <i>q^wweyaʔx^w</i> <i>Qw'eya'xw</i> | "boiling water" | Garry Point, on the southwestern tip of Lulu Island, at the mouth of the main channel of the Fraser River | MIB 1976, MBC 1984, Suttles 2004, HTG 2005b, VAFFC 2011, PMV 2015 |
| <i>q^wúya'x^w stáləw</i> <i>q^wweyaʔx^w staləw</i> | "river" (<i>stalew</i>) | Main channel of the Fraser River at Steveston | MIB 1976, MBC 1984, Suttles 2004, PMV 2015 |

Schedule B Aboriginal Groups

10.1.1.1 Cowichan Tribes

Cowichan Tribes, along with Halalt First Nation, Penelakut Tribe, and Stz'uminus First Nation, have engaged directly with the Ministry on this Project and also collectively as member First Nations of the Cowichan Nation Alliance.

Cowichan Tribes is governed by a chief and council with a two-year term under an *Indian Act* electoral system. Cowichan Tribes has a 13-member council, with the current term expiring in December 2017 (AANDC 2016).

While the First Nations affiliated with the Cowichan Nation Alliance have explained that they traditionally resided on both sides of the Strait of Georgia as part of a seasonal round (PMV 2015), Cowichan Tribe's main present-day community is located in Cowichan, on southeast Vancouver Island. The largest First Nation in British Columbia, Cowichan Tribes has 2,455 of its total membership of 4,755 living on reserve. (AANDC 2016). The Project area does not overlap Cowichan Tribes' current or former reserve lands.

Cowichan Tribes is, or has been, affiliated with the Hul'qumi'num Treaty Group, along with the other three Cowichan Nation Alliance members, Lake Cowichan First Nation and Lyackson First Nation. These First Nations have been described as speakers of the "Island" dialect of Halkomelem (*Hul'q'umi'num*), and have referred to themselves collectively as *Hul'qumi'num Mustimuhw* (HTG 2005).

The Hul'qumi'num Treaty Group member bands collectively assert a core territory or "title lands" and a wider marine or fishing territory, as described in its Statement of Intent to the British Columbia Treaty Commission. Core areas over which title is asserted include but are not limited to "the south arm of the Fraser River, including Canoe Pass, up to and including Douglas Island, with lands on the north shore of the south arm up to Sapperton Channel (New Westminster), the islands in the south arm of the Fraser River and the south bank of the Fraser River along Canoe Pass up to Deas Island" (BCTC 2004). This area is subsumed within the broader marine or fishing territory. The core territory of the Hul'qumi'num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**).

Cowichan Tribes, along with each of the other Cowichan Nation Alliance member First Nations, has a Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia (MARR 2014). The territorial maps attached to these agreements typically include areas on the western side of the Strait of Georgia only.

Locations along the South Arm of the Fraser River of importance to Cowichan Tribes, along with the other Cowichan Nation Alliance member First Nations, in the vicinity of the Project include but are not limited to *Tl'uq̓tinus*, spanning the north shore from opposite Deas Island to opposite Tilbury Island (CNA 2016), and *Hwlh̓its'um* or *Xwulit'sum*, on Canoe Pass. Both of these areas are considered by Cowichan Nation Alliance member bands, including Cowichan Tribes, as ancestral village and resource sites. A member First Nation of the organization has previously reported that the Cowichan Nation Alliance is working to re-establish a permanent land base at *Tl'uq̓tinus* for residential and/or commercial purposes (CNA 2016a,b, SFN 2013). Cowichan Nation Alliance's *Tl'uq̓tinus* claim area is shown in Section 10.1.3.2 (Existing Conditions) in Plate 1: Lands of *Tl'uq̓tinus* Claim Area (CNA 2016a).

10.1.1.2 Halalt First Nation

Halalt First Nation, along with Cowichan Tribes, Penelakut Tribe, and Stz'uminus First Nation, have engaged directly with the Ministry on this Project and also collectively as member First Nations of the Cowichan Nation Alliance.

Halalt First Nation is governed by a chief and council with a two-year term under an *Indian Act* electoral system. Halalt has a three-member council, with the current term expiring in April 2017 (AANDC 2016).

While the First Nations affiliated with the Cowichan Nation Alliance have explained that they traditionally resided on both sides of the Strait of Georgia as part of a seasonal round (PMV 2015), Halalt's main present-day community is located in Chemainus on southeast Vancouver Island. Of 212 registered members, 84 live on reserve (AANDC 2016). The Project area does not overlap any of Halalt's current or former reserve lands.

Halalt is, or has been, affiliated with the Hul'qumi'num Treaty Group, along with the other three Cowichan Nation Alliance members, Lake Cowichan First Nation and Lyackson First Nation. These First Nations have been described as speakers of the "Island" dialect of Halkomelem (*Hul'q'umi'num*), and have referred to themselves collectively as *Hul'qumi'num Mustimuhw* (HTG 2005).

The Hul'qumi'num Treaty Group member bands collectively assert a core territory or "title lands" and a wider marine or fishing territory, as described in its Statement of Intent to the British Columbia Treaty Commission. Core areas over which title is asserted include but are not limited to "the south arm of the Fraser River, including Canoe Pass, up to and including Douglas Island, with lands on the north shore of the south arm up to Sapperton Channel (New Westminster), the islands in the south arm of the Fraser River and the south bank of the

Fraser River along Canoe Pass up to Deas Island” (BCTC 2004). This area is subsumed within the broader marine or fishing territory. The core territory of the Hul’qumi’num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**).

Halalt, along with each of the other Cowichan Nation Alliance member First Nations, has a Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia (MARR 2014). The territorial maps attached to these agreements typically include areas on the western side of the Strait of Georgia only.

Locations along the South Arm of the Fraser River of importance to Halalt, along with the Cowichan Nation Alliance member First Nations, in the vicinity of the Project include but are not limited to *Tl’uqtinus*, spanning the north shore from opposite Deas Island to opposite Tilbury Island (CNA 2016), and *Hwlhitsu’um* or *Xwulit’sum*, on Canoe Pass. Both of these areas are considered by Cowichan Nation Alliance member bands as ancestral village and resource sites. A member First Nation of the organization has previously reported that the Cowichan Nation Alliance is working to re-establish a permanent land base at *Tl’uqtinus* for residential and/or commercial purposes (CNA 2016a,b, SFN 2013). Cowichan Nation Alliance's *Tl’uqtinus* claim area is shown in Section 10.1.3.2 (Existing Conditions) in Plate 1: Lands of *Tl’uqtinus* Claim Area (CNA 2016a).

10.1.1.3 Katzie First Nation

Katzie First Nation is governed by a chief and council with two-year terms under a custom electoral system. The current term for the four-member council expires in March 2018 (AANDC 2016).

The main Katzie First Nation community resides on Katzie 1, on the north bank of the Fraser River, west of Port Hammond, and south of the town of Pitt Meadows (AANDC 2016, Katzie First Nation 2016a). Katzie First Nation has four other reserves: Katzie 2, on the south bank of the Fraser River, upstream of Katzie 1 and opposite Port Hammond; Barnston Island 3, on the south shore of Barnston Island, which lies within the Fraser River; Pitt Lake 4, at the lower end of Pitt Lake; and Graveyard 5, the Katzie cemetery south of Lougheed Highway (AANDC 2016, Katzie First Nation 2016a). Of 570 registered Katzie members, 315 live on reserve (AANDC 2016). Katzie is working toward finalizing a land code that would apply to Katzie reserve lands pursuant to the federal *Framework Agreement on First Nation Land Management* and the *First Nations Land Management Act* (Katzie First Nation 2016b). The Project area does not overlap any current or former Katzie reserve lands.

Katzie’s ancestral language is *Hə́n̓q̓əmi̓n̓əh̓*, and Katzie reports that they are among the most inland speakers of this “downriver” dialect of Mainland Halkomelem (Katzie First Nation 2016a). Katzie have described their traditional territory as “extending south from the headwaters of the Pitt River to encompass Pitt Lake, Pitt Polder, a portion of the Fraser River, and south east to encompass the Nicomekl and Serpentine Rivers” (Katzie First Nation 2016a). In the east, this territory takes in Alouette Lake, Rolley Lake, portions of Fort Langley and Hazelmere, while in the west, the territory follows the height of land north along the mountain range through Pinecone-Burke Mountain Provincial Park to encompass all tributaries of the Pitt River system (Katzie First Nation 2016a). The Project area overlaps the southwestern portion of Katzie First Nation territory (**Appendix 10-A, Figure 10-4**).

Katzie First Nation owns and operates Katzie Development Limited Partnership, a cultural and environmental management services firm established in 2006 (KDC 2016). Other economic interests of the Katzie First Nation include a three-year Forest and Range Consultation and Revenue Sharing Agreement with the Province of British Columbia, signed in 2014 (Katzie First Nation and BC 2014).

10.1.1.4 Kwantlen First Nation

Kwantlen First Nation is governed by a chief and council under a custom electoral system. The current chief and two councillors were appointed in November 1993 (AANDC 2016).

The main community of the Kwantlen First Nation resides on McMillan Island 6, in the Fraser River to the north of Fort Langley. Of 269 registered members, 70 live on reserve, of which the Kwantlen have six, including McMillan Island 6, all centered on the area of confluence between the Stave River and the Fraser River. Kwantlen also share the *Pekw’Xe:yles* (Peckquaylis) reserve, approximately 2 km upstream of the Mission Bridge, with 20 Stó:lō nations (AANDC 2016). None of these reserves overlap the proposed Project area.

Kwantlen traditional territory has been previously shown to extend from the watershed of the Stave River in the north to the international border in the south, taking in the northeastern part of Boundary Bay, the Serpentine, Nicomekl, and Salmon Rivers, as well as the Fraser River upstream of Tilbury Island to the Nicomen Slough, near Chilliwack (Kwantlen First Nation and BC 2012). This territory overlaps the portion of the Project area at its westernmost extent (i.e., between Highway 17 and Highway 91), but does not overlap the Project area at or north of the Fraser River (**Appendix 10-A, Figure 10-5**). A map recently provided by Kwantlen shows “Kwantlen Territory 2015” as extending further westward along the Fraser River, taking in Deas Island and all of Lulu Island, and therefore overlapping all of the Project area (Kwantlen First Nation 2015).

Kwantlen, while ancestrally a *Həŋqəmiŋəm*-speaking nation (Kwantlen First Nation 2015, FPHLCC 2014), has been affiliated with the Stó:lō Tribal Council since 2005, when the organization formed out of a separation from the Stó:lō Nation. The Stó:lō speak the “Upriver” form of Halkomelem or *Halq'eméylem* (FPHLCC 2014). Kwantlen First Nation consults on Kwantlen interests independently of the Stó:lō Tribal Council, under the leadership of a Hereditary Chief and two-member appointed council that has been in place since 1993 (AANDC 2016). Like other members of the Stó:lō Tribal Council, Kwantlen is not currently involved in treaty negotiations; however, in March 2012, the Nation reached a three-year agreement with the Province on forest resource consultation and revenue-sharing (Kwantlen First Nation and BC 2012).

Since 2011, the economic arm of the Kwantlen First Nation has operated as Seyem' Qwantlen Business Group, representing five limited partnerships owned by the Nation, and providing services principally in the areas of contracting (construction, excavation, and earthworks), on and off reserve land development, and resource management (fisheries, forestry, archaeology) (SQBG 2014).

10.1.1.5 Lake Cowichan First Nation

Lake Cowichan First Nation is governed by a four-member council under a custom electoral system. The late Chief Cyril Livingstone and one councillor were appointed in October 1977, while two other councillors were appointed in March 1999 (AANDC 2016).

Lake Cowichan First Nation membership takes descent from both Ditidaht (Nuu-chah-nulth) ancestors and *Hul'qumi'num'* ancestors known as the Somenos (or Saumni, Samena, Saumina and other variations), one of seven village groups comprising the Cowichan Tribes (Rozen 1985). The community is based on a single reserve on the northeastern shore of Cowichan Lake, approximately 30 km west of Duncan (on the east coast of Vancouver Island), and less than 20 km east of Nitinat Lake (on the west coast of Vancouver Island). In 1860, the community was significantly affected by a smallpox epidemic (Rozen 1985, VAFFC 2011); the population has remained small, with only 12 of 20 registered members living on reserve (AANDC 2016). The Project area does not overlap any current or former Lake Cowichan reserve lands.

Lake Cowichan First Nation have stated that Cowichan Lake has always been their primary home, and that their traditional territory is centred on the lake, taking in surrounding lands, streams, and other waters, including the uppermost part of the Cowichan River. They have also stated that their use of this territory has continued to the present day (LCFN 2014). A three-year Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia, dated 2011, identifies this Vancouver Island-based territory (LCFN and BC 2011).

Based on their affiliation with the Hul'qumi'num Treaty Group, the Lake Cowichan First Nation has also been associated with a larger, collective traditional territory with the other member First Nations of that group. The core territory of the Hul'qumi'num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**). The other members of the Hul'qumi'num Treaty Group – namely, Cowichan Tribes, Halalt First Nation, Penelakut Tribe, and Stz'uminus First Nation – are working jointly on their Fraser River interests through the Cowichan Nation Alliance (BC and PMV 2012). Lake Cowichan First Nation is engaging with the Ministry on the Project separately from the Cowichan Nation Alliance.

10.1.1.6 Lyackson First Nation

Lyackson First Nation is governed by a chief and council under a custom electoral system. The chief of the four-member council was appointed in April 2006. The other three councillors are elected for four-year terms, with the current term expiring in June 2018 (AANDC 2016).

The Lyackson First Nation has three reserves, all on Valdes Island (*Le'eyqsun*), which lies approximately 45 km west of the Project area on the east side of the Strait of Georgia, directly opposite the mouth of the Fraser River. Over 90% of Lyackson First Nation's registered membership lives off reserve, principally on southeastern Vancouver Island (AANDC 2016). The Project area does not overlap any current or former Lyackson First Nation reserve lands.

The Lyackson First Nation has described *Le'eyqsun* as their homeland and ancestral territory, one in which they continue to engage in traditional practices on a seasonal basis (LFN 2015).

Based on their affiliation with the Hul'qumi'num Treaty Group, the Lyackson First Nation has been associated with a collective traditional territory with the other member First Nations of that group. The core territory of the Hul'qumi'num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**). The other members of the Hul'qumi'num Treaty Group – namely, Cowichan Tribes, Halalt First Nation, Penelakut Tribe, and Stz'uminus First Nation – are working jointly on their Fraser River interests through the Cowichan Nation Alliance (BC and PMV 2012). Lyackson First Nation is engaging with the Ministry separately from the Cowichan Nation Alliance.

10.1.1.7 Musqueam Indian Band

Musqueam Indian Band is governed by a chief and council with two-year terms under an *Indian Act* electoral system. The current term for the 11-member council expires in January 2017 (AANDC 2016).

The main community of the Musqueam is based at the mouth of the North Arm of the Fraser River, within the limits of the City of Vancouver, where 671 of 1337 registered members reside (AANDC 2016). A second reserve is located across the river from this location, on Sea Island, within the City of Richmond, while a third reserve is located in Ladner, near Canoe Pass, off the South Arm of the Fraser River. At one time, the Musqueam had a fourth reserve (the first reserve set aside for them) further up the Fraser River at *Qiqéyt* (Brownsville), on the south shore of the Fraser River, across from New Westminster, adjacent to a reserve for the Kwantlen (Crockford 2010, MIB 1976, MBC 1984). The Project area does not overlap any current or former Musqueam Indian Band reserve lands.

The Musqueam Indian Band's traditional territory has been described as follows:

The lands, lakes and streams defined and included by a line commencing at Harvey Creek in Howe Sound and proceeding Eastward to the height of land and continuing on the height of land around the entire watershed draining into English Bay, Burrard Inlet and Indian Arm; South along the height of land between Coquitlam River and Brunette River to the Fraser River, across to the South or left bank of the Fraser River and proceeding downstream taking in the left bank of the main stream and the South Arm to the sea, including all those intervening lands, islands and waters back along the shore to Harvey Creek, AND, the sea, its reefs, flats, tidal lands and islands adjacent to the above described land and out to the centre of Georgia Strait (MIB 1976).

The Project area falls almost entirely within the boundaries described above (**Appendix 10-A, Figure 10-6**); these boundaries are consistent with Musqueam Indian Band's Statement of Intent, filed with the British Columbia Treaty Commission (BCTC 1993). The Project area is also situated approximately 4 km upstream of Canoe Pass, where Musqueam Indian Band have an established Aboriginal right to fish for food, social, and ceremonial purposes pursuant to the Supreme Court of Canada's decision in *R. v. Sparrow* [1990], 1 S.C.R. 1075 (SCC 1990). The Ministry understands the Musqueam take the view that their established right extends to areas beyond Canoe Pass. Musqueam territory was described in the *Sparrow* decision "as extending from the north arm of Burrard Inlet to the south shore of the main channel of the Fraser River including the waters of Burrard Inlet, the North Arm, the Middle Arm, the Main Channel, Canoe Pass (or passage) and Ladner Reach" (MIB 2015).

In 2008, Musqueam and the Province of British Columbia entered into a Reconciliation, Settlement and Benefits Agreement, which transferred several land parcels to the Musqueam in fee simple, including but not limited to areas in Pacific Spirit Regional Park and the University Golf Course in Point Grey, and along Bridgeport Road in Richmond, at the confluence of the

North and Middle Arms of the Fraser River, known as the “Bridgepoint Lands” (MARR 2014). The Bridgepoint Lands are immediately to the west of the south end of the Oak Street Bridge, at the northern end of the Highway 99 corridor, approximately 1 km northwest of the Project. Musqueam produced a comprehensive community development plan in 2011 that, in part, guides decision-making for the Nation’s reserve and fee simple lands (MFN 2011).

10.1.1.8 Penelakut Tribe

Penelakut Tribe, along with Cowichan Tribes, Halalt First Nation, and Stz’uminus First Nation, have engaged directly with the Ministry on this Project *and also collectively as member First Nations of the Cowichan Nation Alliance*.

Penelakut Tribe is governed by a chief and council with a two-year term under an *Indian Act* electoral system. Penelakut has a 13-member council, with the current term expiring in February 2018 (AANDC 2016).

While the First Nations affiliated with the Cowichan Nation Alliance have explained that they traditionally resided on both sides of the Strait of Georgia as part of a seasonal round (PMV 2015), Penelakut’s primary village (Penelakut IR 7) is on Penelakut Island, to the east of Chemainus on southeast Vancouver Island. Penelakut members also reside on Kuper, Tent and Galiano islands. Of Penelakut’s 952 registered members, 525 live on reserve. (AANDC 2016). The Project area does not overlap any of Penelakut’s current or former reserve lands.

Penelakut is, or has been, affiliated with the Hul’qumi’num Treaty Group, along with the other three Cowichan Nation Alliance members, Lake Cowichan First Nation and Lyackson First Nation. These First Nations have been described as speakers of the “Island” dialect of Halkomelem (*Hul’q’umi’num’*), and have referred to themselves collectively as *Hul’qumi’num Mustimuhw* (HTG 2005).

The Hul’qumi’num Treaty Group member bands collectively assert a core territory or “title lands” and a wider marine or fishing territory, as described in its Statement of Intent to the British Columbia Treaty Commission. Core areas over which title is asserted include but are not limited to “the south arm of the Fraser River, including Canoe Pass, up to and including Douglas Island, with lands on the north shore of the south arm up to Sapperton Channel (New Westminster), the islands in the south arm of the Fraser River and the south bank of the Fraser River along Canoe Pass up to Deas Island” (BCTC 2004). This area is subsumed within the broader marine or fishing territory. The core territory of the Hul’qumi’num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**).

Penelakut, along with each of the other Cowichan Nation Alliance member First Nations, has a Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia (MARR 2014). The territorial maps attached to these agreements typically include areas on the western side of the Strait of Georgia only.

Locations along the South Arm of the Fraser River of importance to Penelakut, along with the Cowichan Nation Alliance member First Nations, in the vicinity of the Project include but are not limited to *Tl'uqtinus*, spanning the north shore from opposite Deas Island to opposite Tilbury Island (CNA 2016), and *Hwlhitsu'm* or *Xwulit'sum*, on Canoe Pass. Both of these areas are considered by Cowichan Nation Alliance member bands as ancestral village and resource sites. A member First Nation of the organization has previously reported that the Cowichan Nation Alliance is working to re-establish a permanent land base at *Tl'uqtinus* for residential and/or commercial purposes (CNA 2016a,b, SFN 2013). Cowichan Nation Alliance's *Tl'uqtinus* claim area is shown in Section 10.1.3.2 (Existing Conditions) in Plate 1: Lands of *Tl'uqtinus* Claim Area (CNA 2016a).

10.1.1.9 Semiahmoo First Nation

Semiahmoo First Nation is governed by a chief and council with two-year terms under an *Indian Act* electoral system. The current term for the three-member council expires in December 2016 (AANDC 2016).

The ancestral language of the Semiahmoo First Nation is *SEMYOME*, one of six dialects of Northern Straits Salish (FPHLCC 2014). Semiahmoo First Nation has one reserve, fronting Semiahmoo Bay (part of Boundary Bay) at the Canada-United States border, about 1 km southeast of White Rock. The reserve, covering 129.10 ha, is home to 51 of the nation's 97 registered members (AANDC 2016). Originally 158.64 ha, portions of the reserve have been successively taken up for public purposes, including for the construction of Highway 99 in 1962. While the Highway 99 corridor runs adjacent to the eastern border of the reserve, the Project area does not include that section of the corridor.

Semiahmoo First Nation traditional territory has been previously represented as centred on Boundary Bay, taking in eastern portions of the Point Roberts peninsula, Mud Bay, and the lands and waters in and around the Serpentine, Nicomekl, and Campbell rivers (MOT 2006). Semiahmoo First Nation has recently presented a more extensive territory that, still centred on Boundary Bay, takes in the Lower Fraser River and adjacent lands downstream of the confluence with the Sumas River, all of the Gulf Islands south of Gabriola Island, the San Juan Islands, most of Bellingham Bay, and the Nooksack River (SFN 2011a). The boundaries of this territory largely take in almost the entire Project area (**Appendix 10-A, Figure 10-7**).

Semiahmoo First Nation is not currently participating in the British Columbia Treaty Commission process.

10.1.1.10 Squamish Nation

The *Skwxwú7mesh Úxwumíxw* (Squamish Nation) describe themselves as the descendants of Coast Salish ancestors that lived in what are now known as the Greater Vancouver area, Gibson's Landing, and Squamish River watershed (SN 2016a). The ancestral language of the Squamish Nation is *Sḵwxwú7mesh sníchim* (FPHLCC 2016, SN 2016b).

Squamish Nation is governed by a 16-member council with four-year terms under a custom electoral system. The current term for the two chiefs and 14 councillors expires in December 2017 (AANDC 2016).

Squamish Nation has 24 reserves, with 2,232 of 4,176 registered members residing on Squamish Nation's reserve lands (AANDC 2016). The largest proportion of these on-reserve members live on the Squamish Nation's several urban reserves in the cities of Vancouver, North Vancouver, and West Vancouver, and the District of Squamish (SN 2016c), with the most populated reserve being Mission 1, on the north shore of Burrard Inlet, bounded on the north and east by the City of North Vancouver (AANDC 2016). The Project area does not overlap any current or former Squamish Nation reserve lands.

Squamish Nation traditional territory, as described in their Statement of Intent filed with the British Columbia Treaty Commission, takes in the area from Point Grey in the south to Roberts Creek in the west; then north along the height of land to the Elaho River headwaters including all the islands and drainages in Howe Sound; then southeast to the confluence of the Soo and Green rivers north from Whistler; then south along the height of land to the Port Moody area including the entire Mamquam River and Indian Arm drainages; then west along the height of land to Point Grey (BCTC 2016). This territorial boundary, as updated from time to time, is asserted by Squamish Nation to extend farther south than described above, and specifically to the South Arm of the Fraser River, taking in all of Lulu Island. This area overlaps the northern half of the Project corridor, including the Tunnel crossing (**Appendix 10-A, Figure 10-8**).

Xay Temíxw (sacred land), the Squamish Nation's Land Use Plan, describes the Squamish Nation's vision for the future of the forests and wilderness of their traditional territory, with the stated objective to ensure the land is protected and managed for the benefit of present and future generations. *Xay Temíxw* has established four land use zones: a forest stewardship zone, sensitive areas, restoration areas, and *Kwa kwayx welh-aynexws* (wild spirit places). *Xay Temíxw* has also set management objectives that define how the lands, waters, and territory

must be managed. Squamish Nation report that they are also undertaking planning for traditional fishing areas, but, due to the sensitivity of the information, may not be mapped or described in the plan (SN 2016d).

The Squamish Nation owns and operates several businesses, including the Mosquito Creek Marina, Lynnwood Marina, Marina Grill, North Vancouver Smoke Shop at Mosquito Creek, Squamish Valley Gas LP, Superstore Gas Bar, North Vancouver, Capilano River RV Park, West Vancouver, and the Northwest Squamish Forestry LP. In addition to revenue generated from existing leases and businesses, the Squamish Nation plans to develop various parcels of lands, including proposed developments at Seymour, Capilano, Kitsilano, Chekwelp and Stawamus (SN 2016a). The Squamish Nation also currently generates revenue from a three-year Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia, signed in March 2015 (BC 2016).

10.1.1.11 Stz'uminus First Nation

Stz'uminus First Nation, along with Cowichan Tribes, Halalt First Nation, and Penelakut Tribe have engaged directly with the Ministry on this Project *and also collectively as member First Nations of the Cowichan Nation Alliance*.

Stz'uminus is governed by a chief and council, but under a custom electoral system, with the current three-year term for the ten-member council expiring in April 2017 (AANDC 2016).

While the First Nations affiliated with the Cowichan Nation Alliance have explained that they traditionally resided on both sides of the Strait of Georgia as part of a seasonal round (PMV 2015), Stz'uminus' main present-day community is located in Ladysmith on southeast Vancouver Island. Of 1,296 registered members, 712 live on reserve (AANDC 2016). The Project area does not overlap any of Stz'uminus' current or former reserve lands.

Stz'uminus is, or has been, affiliated with the Hul'qumi'num Treaty Group, along with the other three Cowichan Nation Alliance members, Lake Cowichan First Nation and Lyackson First Nation. These First Nations have been described as speakers of the "Island" dialect of Halkomelem (*Hul'q'umi'num'*), and have referred to themselves collectively as *Hul'qumi'num Mustimuhw* (HTG 2005).

The Hul'qumi'num Treaty Group member bands collectively assert a core territory or "title lands" and a wider marine or fishing territory, as described in its Statement of Intent to the British Columbia Treaty Commission. Core areas over which title is asserted include but are not limited to "the south arm of the Fraser River, including Canoe Pass, up to and including Douglas

Island, with lands on the north shore of the south arm up to Sapperton Channel (New Westminster), the islands in the south arm of the Fraser River and the south bank of the Fraser River along Canoe Pass up to Deas Island” (BCTC 2004). This area is subsumed within the broader marine or fishing territory. The core territory of the Hul’qumi’num Treaty Group overlaps the Project area at the Tunnel crossing (**Appendix 10-A, Figure 10-2**).

Stz’uminus, along with each of the other Cowichan Nation Alliance member First Nations, has a Forest Consultation and Revenue Sharing Agreement with the Province of British Columbia (MARR 2014). In the map for the Stz’uminus’ 2013 agreement, the territory depicted is equivalent to the collective core territory of the Hul’qumi’num Treaty Group.

Locations along the South Arm of the Fraser River of importance to Stz’uminus, along with the Cowichan Nation Alliance member First Nations, in the vicinity of the Project include but are not limited to *Tl’uqtinus*, spanning the north shore from opposite Deas Island to opposite Tilbury Island (CNA 2016), and *Hwlhitsu’um* or *Xwulit’sum*, on Canoe Pass. Both of these areas are considered by Cowichan Nation Alliance member bands as ancestral village and resource sites. A member First Nation of the organization has previously reported that the Cowichan Nation Alliance is working to re-establish a permanent land base at *Tl’uqtinus* for residential and/or commercial purposes (CNA 2016a,b, SFN 2013). Cowichan Nation Alliance’s *Tl’uqtinus* claim area is shown in Section 10.1.3.2 (Existing Conditions) in Plate 1: Lands of *Tl’uqtinus* Claim Area (CNA 2016a).

10.1.1.12 Tsawwassen First Nation

The Tsawwassen First Nation is based on the southern aspect of Fraser River delta, on the west side of the peninsula that separates Boundary Bay from the Strait of Georgia. Pursuant to the Tsawwassen First Nation Final Agreement (TFNFA), which came into effect on April 3, 2009, the Tsawwassen First Nation is a self-governing community led by a chief and council that are elected every three years. The current three-year term for the five-member council expires in April 2019 (AANDC 2016).

Under the TFNFA, the Tsawwassen First Nation acquired 724 ha of treaty settlement lands, including 290 ha of former reserves and 372 ha of former Provincial Crown Land (TFN et al. 2009a). These 662 ha of Tsawwassen Lands, located on the upland areas between the ferry terminal at Tsawwassen and the container port at Roberts Bank, are owned by and under the jurisdiction of the Tsawwassen First Nation, and are guided by the Tsawwassen First Nation Land Use Plan (see **Section 5.3 Land Use**). An additional 62 ha of fee simple land near Boundary Bay and on the Fraser River (along Canoe Pass) are owned by the Tsawwassen First Nation, but are under the jurisdiction of the Corporation of Delta (TFN et al. 2009a). Roughly

half (184) of the Tsawwassen First Nation's registered population (365) reside on Tsawwassen Lands (AANDC 2016). The Project area does not overlap any of the treaty settlement lands of the Tsawwassen First Nation (**Appendix 10-A, Figure 10-9**).

In addition to fee simple interests, the TFNFA secures harvesting rights to the Tsawwassen First Nation in areas located within Tsawwassen Territory, which is defined in the TFNFA as the area of land that Tsawwassen First Nation identified in its Statement of Intent to the British Columbia Treaty Commission, and included as a map in Appendix A to the agreement (TFN et al. 2009b). This territory extends from the southern Gulf Islands to the area around Pitt Lake. Rights under the TFNFA are limited by measures necessary for conservation, public health, or public safety (TFN et al. 2009a).

The Project area lies within Tsawwassen Territory, and is situated in or near several harvesting areas defined in the TFNFA relating to fishing, wildlife and migratory bird harvesting, and plant gathering (TFN et al. 2009a,b). These areas also appear on **Appendix 10-A, Figure 12-9** and are further described in **Section 10.1.3 Aboriginal Interests Assessment**.

10.1.1.13 Tsleil-Waututh Nation

Tsleil-Waututh Nation is governed by a chief and council with two-year terms under an *Indian Act* electoral system. The current term for the six-member council expires in March 2017 (AANDC 2016).

The main Tsleil-Waututh community is located in North Vancouver, on the shore of Burrard Inlet, approximately 2 km east of the north end of the Second Narrows Bridge, on Burrard Inlet 3 (AANDC 2016). Two other reserves, Inlailawatash 4 and Inlailawatash 4A, are located on Indian Arm. Of 578 registered members, 287 reside on Tsleil-Waututh reserves (AANDC 2016). The Project area does not overlap any current or former reserve lands of the Tsleil-Waututh Nation.

Tsleil-Waututh's Consultation Area extends from the vicinity of Mount Garibaldi in the north to the 49th parallel (and beyond) in the south, Gibsons in the west, and Coquitlam Lake in the east (TWN 2008, TWN 2016). Tsleil-Waututh Nation report that this Consultation Area encompasses all the waters and lands used by Tsleil-Waututh during extensive seasonal rounds of travel and resource harvest, and includes both areas exclusively occupied and governed by Tsleil-Waututh and areas to which Tsleil-Waututh is granted access according to Coast Salish protocols (TWN 2016). The Project area lies fully within this Consultation Area (**Appendix 10-A, Figure 10-10**).

The Tseil-Waututh established an Economic Development Department in 1992. The Nation owns and operates several businesses, including Takaya Developments Ltd. (real estate development), Takaya Tours (cultural tourism), TWN Wind Power Inc. (small wind turbine distribution), Inlailawatash Forestry Limited Partnership (natural and cultural resources consulting service), Salish Seas Limited (a partnership between Tseil-Waututh Nation, Sliammon First Nation, and Musqueam Indian Band), TWN and Aquilini Group, and SPAL General Constructors, a project management company co-owned with Tsawwassen First Nation (TWN 2014, TWN 2016). Other important related Tseil-Waututh organizations and agreements of include the First Nations Legacy Society (also involving Katzie First Nation, Kwantlen First Nation, Kwikwetlem First Nation, Musqueam Indian Band, and Tsawwassen First Nation) and the MST Land Protocol (TWN 2016).

10.1.1.14 Hwlitsum

Members of the Hwlitsum community, who consider themselves descendants of the Lamalchi and close relatives of the Penelakut Tribe (i.e., from Kuper Island), reside in the area of Canoe Pass, and carry the Halkomelem name for this location (e.g., *Hwlhitsu'um*, *Xwulit'sum*) (HFN 2016a). While Hwlitsum community members, who number over 300, are individually registered Indians under the *Indian Act*, they are not collectively recognized as a “band” under the *Indian Act* and do not have any reserves (BC and PMV 2012). The group is represented by a chief.

Hwlitsum report that early ethnographic sources often employ the term “Cowichan” to refer to a set of linked communities that include the Hwlitsum (HFN 2016). Hwlitsum consider the “Island” dialect of Halkomelem as their ancestral language and have described themselves as related to but independent of the Cowichan Nation community (HFN 2016b).

In 2008, Hwlitsum’s Statement of Intent was accepted into the British Columbia Treaty Commission (BCTC) process. The Ministry understands that Canada and BC advised Hwlitsum at that time that they had decided to not continue negotiations to Stage 2 of that process. A representation of Hwlitsum’s traditional territory, based on Hwlitsum’s Statement of Intent boundary submitted to the BCTC (HFN 2008), is presented in relationship to the proposed Project area in **Appendix 10-A, Figure 10-3**.² Hwlitsum note that they have been recognized as a First Nation by government entities, including the BC Treaty Commission.

² Any statements in this Application regarding Hwlitsum are based on information provided by Hwlitsum in the context of consultation on the Project, or as available in publicly available sources, and do not constitute admissions, acknowledgments or endorsements of the claims, positions, or accuracy of the information by the Province of British Columbia.

10.1.2 Consultation Activities

10.1.2.1 Overview

This section provides information regarding the consultation activities that the Ministry carried out prior to submission of the Application and those planned during the remainder of the EA process with respect to Aboriginal Groups that may be affected by the Project or that have Aboriginal Interests within the Project alignment. This section also provides an overview of the Project's Aboriginal Consultation Plan and a summary of proposed changes to the Aboriginal Consultation Plan based on input from Aboriginal Groups and implementation of the Aboriginal Consultation Plan thus far. A summary and status of key issues and concerns raised by Aboriginal Groups and the Ministry's plans for addressing outstanding concerns is also presented.

Two phases of consultation are complete. To date, more than 80 meetings have taken place with Aboriginal Groups involved with the Project. The table below describes the consultation phases for the Project and the duration and status of each.

Table 10.1-2 Phases of Consultation with Aboriginal Groups

| | Consultation Phase | Overview | Duration/Status |
|---|----------------------|---|---|
| 1 | Initial Consultation | Project development and planning up to the December 16, 2015 submission of Project Description. Includes collection of baseline information, sharing of draft EA-related documents (i.e. Project Description and Areas of Study, AIR) | Start of consultation (January 2013) to December 2015 |
| 2 | Pre-application | Period from the filing of the Project Description to Application submission, including issuance of section 11 Order, AIR development and collection of baseline information (may include submission of permit applications) | December 2015 – TBD |

| | Consultation Phase | Overview | Duration/Status |
|---|--|---|-----------------|
| 3 | Application review Consultation | EAO acceptance of the Application to the end of the Application Review stage (180 days). This will be followed by the Minister’s decision (up to 45 days) with respect to in the issuance of an Environmental Assessment Certificate (EAC). | TBD |
| 4 | Post Environmental Assessment Certificate (EAC) Consultation | Post EAC issuance to the date when all permit applications have been adjudicated and permits issued | TBD |

10.1.2.2 Consultation Approach: Objectives & Principles

The primary objective of the Project’s Aboriginal consultation program is to maintain and, where possible, enhance respectful, positive and productive relationships with Aboriginal Groups while meeting all applicable legal, policy and regulatory requirements in relation to the Project. Additional objectives include providing opportunities for Aboriginal Groups to provide meaningful input for consideration in the EA and permitting processes and undertaking consultation with Aboriginal Groups in accordance with the Project’s Aboriginal Consultation Plan. Objectives of the Aboriginal Consultation Plan are presented below in **Section 10.1.2.3**.

The approach to Aboriginal consultation has been and will continue to be undertaken according to the principles outlined below.

Timeliness:

- Provide relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Aboriginal Interests.
- Provide opportunities for Aboriginal Groups to share views of the Project with the Ministry and EAO within reasonable timeframes.

Inclusiveness, responsiveness & participation:

- Plan and implement mutually acceptable consultation activities that support effective participation of Aboriginal communities in the EA as well as related regulatory and permitting processes.
- Consult in accordance with the section 11 Order requirements and the Project's Aboriginal Consultation Plan and continue to work with Aboriginal Groups to revise or update, where appropriate and necessary, components of the Consultation Plan that will support a meaningful, respectful and successful process.
- Establish and maintain dialogue throughout the EA process as a means of providing opportunities to respond to outstanding concerns.
- Provide opportunities for Aboriginal Groups to identify potential adverse effects of the Project on Aboriginal Interests, including cumulative effects and, to the extent appropriate, develop ways to mitigate or otherwise accommodate potential adverse effects.
- Involve Aboriginal groups in relevant studies including, but not limited to, archaeological fieldwork.
- Incorporate Aboriginal traditional knowledge in Project components, when it is shared by Aboriginal Groups and with appropriate permission for its use and inclusion.
- Provide capacity funding to support Aboriginal Groups for the purposes of reviewing, understanding and providing input to the Project's EA and permitting processes.

Respect & relationships:

- Build and foster mutually respectful relationships with Aboriginal Groups.
- Consult with Aboriginal Groups in a respectful and appropriate manner.
- Actively explore opportunities to provide economic and non-economic benefits to Aboriginal Groups that are directly affected by the Project. Opportunities include employment, training, and contracting as well as participation in environmental enhancement and other components of the Project.
- Respect processes and requirements related to the use of information shared by Aboriginal groups, including keeping documents or specific information confidential as requested by communities.³

³ The Ministry is subject to the provisions of the Freedom of Information and Protection of Privacy Act. Subject to the requirements of applicable laws, the Ministry will work with Aboriginal Groups to develop appropriate terms to protect information that is shared by Aboriginal Groups during Project consultation.

Aboriginal Consultation Plan: Overview

The Ministry is committed to positive working relationships with Aboriginal Groups and meeting legal and regulatory requirements for consultation with those Aboriginal Groups listed in Schedule B of the section 11 Order. The Ministry is also committed to meeting section 11 Order requirements pertaining to Schedule C Aboriginal Groups.

The Project's Aboriginal Consultation Plan has been developed in consultation with Schedule B Aboriginal Groups, in order to meet the Aboriginal consultation requirements as delegated by EAO and to maintain and, where possible, enhance positive working relationships between the Ministry and the respective Aboriginal Groups.

The objectives and requirements of the Aboriginal Consultation Plan are to:

- Provide relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Aboriginal Interests
- Plan and implement mutually acceptable consultation activities that support effective participation of Aboriginal communities in the EA as well as related regulatory and permitting processes
- Establish and maintain dialogue throughout the EA as a means of providing opportunities to respond to outstanding concerns
- Provide opportunities for Aboriginal Groups to share views of the Project with the Ministry and EAO within reasonable timeframes
- Provide opportunities for Aboriginal Groups to identify potential adverse effects of the proposed Project on Aboriginal Interests, including cumulative effects and, to the extent appropriate, develop ways to mitigate or otherwise accommodate potential adverse effects
- Involve Aboriginal Groups, where possible, in relevant studies including, but not limited to, archaeological fieldwork.
- Incorporate community and traditional knowledge in Project components
- Document and report to EAO on the Ministry's Aboriginal consultation program at times specified by EAO

Prior to the Pre-Application Phase of the Project, the Ministry worked with Schedule B Aboriginal Groups to determine appropriate tools to support consultation. Consultation activities were based on the specific needs and preferences of these Aboriginal Groups and the Consultation Plan included individualized plans that were co-developed and reviewed.

The Ministry considered the following in the development of a Draft Aboriginal Consultation Plan for Schedule B Aboriginal Groups' review and comment:

- Regulatory and legal requirements with respect to consultation with Aboriginal Groups
- Positive, respectful and productive working relationships with Aboriginal Groups
- Established working relationships with Aboriginal Groups and past consultation experience
- Specific input received during consultation meetings and discussions with Aboriginal Groups with respect to the consultation approach and activities
- Consultation activities, agreed to by both parties, specified under existing Project participation funding agreements.

10.1.2.3 Feedback and Proposed Changes to the Aboriginal Consultation Plan.

The Aboriginal Consultation Plan was provided to Aboriginal Groups in October 2015 for review and comment, revised based on input received, and approved by EAO on April 6, 2016. The Aboriginal Consultation Plan was developed with the understanding that it is a working document that may be revised should ongoing engagement with Aboriginal Groups lead to the identification of preferred alternatives or modifications to planned consultation activities. The Ministry undertook the following process in order to obtain and, where appropriate, incorporate input on the Draft Aboriginal Consultation Plan:

| | |
|-----------------------|--|
| Initial Draft Review: | Draft Aboriginal Consultation Plan was emailed to Aboriginal Groups. Follow up communications (email and phone calls) reiterated the request for Aboriginal Groups to review and comment on the document; provided an offer to meet regarding the Draft Aboriginal Consultation Plan and/or to respond to any questions; confirmed intent of Aboriginal Groups to submit comments; discussed or obtained clarification on any comments provided to the Ministry; and coordinated meetings or calls regarding the Draft Plan. |
| Revision: | Draft Aboriginal Consultation Plan was revised to reflect input received from Aboriginal Groups |
| Revised Draft Review: | Revised Draft Aboriginal Consultation Plan was emailed to Aboriginal Groups with a summary of responses and corresponding action taken by the Ministry (i.e. revision, comment "noted", request for further discussion regarding request). Follow up communication responded to questions regarding the Aboriginal Consultation Plan; confirmed receipt of revised Aboriginal Consultation Plan; and included an offer to meet. |

The approved Aboriginal Consultation Plan is inclusive of current feedback from Aboriginal Groups with respect to proposed consultation activities and approach. In an effort to ensure the objectives of the Aboriginal Consultation Plan are met, the Ministry will continuously seek input from Aboriginal Groups with respect to any suggested changes and/or challenges with respect to implementation.

Musqueam recently has identified concerns in relation to the Provincial regulatory process and how Musqueam is to be consulted on environmental assessments within Musqueam's asserted traditional territory. The Ministry is committed to support effective and meaningful consultation with Musqueam regarding the Project. Any broader discussions between Musqueam and EAO or the Province regarding the provincial regulatory process are beyond the scope of the Project.

10.1.2.4 Aboriginal Consultation Methods – Initial Consultation and Pre-Application Phases

The Ministry implemented a broad range of consultation methods to obtain information regarding Aboriginal Interests and Aboriginal Group's past, present and desired future use information as it pertains to the exercise of Aboriginal Interests within the Project area, the potential for Project-related adverse effects on Aboriginal Interests and measures to avoid, mitigate or otherwise accommodate, as appropriate, any adverse effects. These methods include, but are not limited to, the following:

- Sharing of Project-related information including focused presentations on topics of interest and/or concern to Aboriginal Groups
- Funding for participation in Project consultation activities and EA process and for traditional use or Project-related studies
- Meeting with Aboriginal Groups' leadership, staff, consultants, elders and membership
- Aboriginal Groups' review of draft EA documents such as the Project Description, Application Information Requirements (AIR), Aboriginal Consultation Plan, and Aboriginal Consultation Reports
- Response and follow up with Aboriginal Groups regarding the identification and resolution of issues

Information Distribution Methods

Aboriginal Groups were provided with Project-related information through information packages; Project fact sheets, maps and conceptual drawings; draft EA-related documents (e.g., Project Description and Key Areas of Study, Archaeological Overview Assessment and Archaeological and Heritage Resources Management Plan, Aboriginal Consultation Plan, Application Information Requirements); presentations; emails and phone calls; and meetings and updates.

Depending on the preferences of respective Schedule B Aboriginal Groups, communication activities have included, but not been limited to, meetings with Chief and/or Council and/or staff and consultants; meetings with elders; conference calls; presentations; community meetings; and site visits.

Technical Workshops and Working Group Meetings

EAO invited Aboriginal Groups identified in Schedule B of the section 11 Order to participate as members in the Working Group. During the Pre-Application stage, EAO held two Working Group meetings where the Ministry presented information on the Project and the EA process and received and responded to comments on those presentations.

10.1.2.5 Methods of Documenting Project Communications

Project-related consultation activities have been and will continue to be documented in accordance with the section 11 Order requirements and based on input from Aboriginal Groups.

The Ministry prepared formal consultation reports in accordance with the section 11 Order and as outlined in the Aboriginal Consultation Plan.

10.1.2.6 Participation Funding

Initial Consultation through to the end of the Pre-Application Phase

Requests for funding to support participation in the Project review process were made by all Schedule B Aboriginal Groups during initial Project-related discussions. In response to these requests, the Ministry provided participation funding and undertook the appropriate planning and discussions with Aboriginal Groups.

When a provincial agency is a proponent of a project going through a provincial EA, that agency provides funding to Aboriginal Groups to support their involvement in pre-Application and Application review phases in place of EAO providing such funding.

Funding provided to date has covered consultation from the Initial Consultation Phase through to the submission of the Application. These funding agreements were aimed at clearly identifying expectations and requirements of both parties with regards to consultation and with respect to Aboriginal Groups' participation in the EA process. They outlined specific consultation activities, identified documents to be provided to Aboriginal groups for review and comment and allocated funding specifically for each Aboriginal Group to prepare/submit their own study or report. Efforts focused on finalizing these agreements, where consultation activities had been discussed and agreed to between the Ministry and each Aboriginal Group, assisted in the development of components of the draft Aboriginal Consultation Plan.

The Ministry entered into Participation Funding Agreements (covering the first two phases of consultation) with the following Aboriginal Groups:

- Cowichan Tribes
- Halalt First Nation
- Katzie First Nation
- Kwantlen First Nation
- Lake Cowichan First Nation
- Lyackson First Nation
- Musqueam Indian Band
- Penelakut Tribe
- Hwlitsum⁴
- Semiahmoo First Nation
- Squamish Nation
- Stz'uminus First Nation
- Tsawwassen First Nation
- Tseil-Waututh Nation

Participation Funding – Application acceptance by EAO through to end of Application Review Phase

The Ministry has been working with Schedule B Aboriginal Groups with respect to their needs for capacity funding for the Application Review Phase, with the aim of providing reasonable capacity support for participation in the review of the EA and any related permitting processes. Funding is intended to facilitate Aboriginal Groups' participation in technical reviews and analyses, for involvement in ongoing consultation activities (as specified in the Consultation Plan), to support Aboriginal Groups in presenting information regarding their respective Aboriginal Interests, and to ensure the consultation requirements pursuant to the section 11 Order are met and the Consultation Plan is implemented as intended. The Ministry continues to work with Aboriginal Groups to finalize funding agreements for the Application Review phase.

⁴ The section 11 Order states, at Schedule B: "EAO's reference to the Hwlitsum is not intended to signify any change in the position that the Province may have taken in other contexts in relation to the duty to consult with this group."

10.1.2.7 Traditional Use, Traditional Knowledge & Other Studies

The Ministry provided additional funding to each Schedule B Aboriginal Group specifically for the preparation and submission of a traditional use study or other mutually agreed to Project-related study. This funding was provided in response to requests from Aboriginal Groups, and in an effort to include and consider Aboriginal input and traditional knowledge in the EA. In addition, studies were funded to enhance the Ministry's understanding of Aboriginal Interests and Aboriginal Group's past, present and desired future use as it pertains to the exercise of Aboriginal Interests within the Project area and the potential adverse effects on identified Aboriginal Interests. To ensure that Aboriginal Groups submitted information that they considered most relevant and useful for the purposes of the EA, the Ministry worked with each Aboriginal Group to determine their preference with respect to the type of study to be provided. This was specified in the respective funding agreements along with agreed-to timelines for the submission of these studies/reports. The Ministry received several requests for extensions to the submission dates for these studies/reports and all requests were accommodated. In adherence to the specified terms and conditions of use, the Ministry reviewed these studies as part of the assessment, along with any other input provided by Aboriginal Groups, including information in relation to their past, current and desired future use of the Project area, Aboriginal Interests and potential Project-related impacts on those Interests. With the exception of the Semiahmoo First Nation, all Aboriginal Groups submitted studies. **Table 10.1-3** outlines the studies submitted by Aboriginal Groups to the Ministry.

Table 10.1-3 Traditional Use, Traditional Knowledge & Other Studies Submitted by Aboriginal Groups

| Aboriginal Group | Study |
|---|---|
| Tseil-Waututh Nation | Tseil-Waututh Knowledge Study for the George Massey Tunnel Project |
| Musqueam Indian Band | Musqueam 2015. Salmon So Thick, That You Could Walk on Water: Preliminary Scope of Musqueam Components for the Environmental Impact Assessment of the Proposed George Massey Tunnel Replacement Project. |
| Tsawwassen First Nation | George Massey Tunnel Replacement: Project Impact Study: An assessment of potential impacts of the George Massey Tunnel Replacement Project on aspects of the TFN Final Agreement, and other considerations |
| Cowichan Nation Alliance (Cowichan Tribes, Halalt, Penelakut and Stz'uminus) | Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015 George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015 Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010 |
| Hwilitsum | Hwilitsum Traditional Use and Occupancy Study 2015 |
| Lyackson First Nation | Preliminary Lyackson Use and Occupancy Mapping Study for BC MOTI's George Massey Tunnel Replacement Project |
| Lake Cowichan First Nation | Ts'uubaasatx Interest: George Massey Tunnel |
| Katzie First Nation | George Massey Tunnel Replacement: Katzie First Nation Traditional Use Study |
| Kwantlen First Nation | Kwantlen Land Use and Occupation in the Vicinity of Highway 99 |
| Squamish Nation | Review of George Massey Tunnel Project April 2016 |

The findings of the TUS listed above have supported the descriptions of existing conditions within Part B of the Application, where information provided from the TUS was applicable. The TUS also helped to identify and describe potential Project-related effects on VCs and ICs, and how an effect on a VC or IC could affect Aboriginal Interests. Potential Project-related effects on Aboriginal Interests are described in more detail in Section 10.3.1 below and summarized in **Table 10.3-1**.

Traditional knowledge shared by Aboriginal Groups supported the selection of candidate VC during early stages of the EA process as well as the descriptions of existing conditions within Part B of the Application and also informed the selection of potential mitigation measures for addressing potential Project-related effects. In particular, Traditional Knowledge related to fish and fish habitat, wildlife, vegetation, marine mammals, and marine use was shared with the Ministry and is described within these specific IC and VC assessments. The Ministry will continue to engage Aboriginal Groups on the integration of Traditional Knowledge and traditional use information through future stages of Project development.

10.1.2.8 Overview of Consultation Activities - Initial Consultation Phase

The Ministry recognized the importance and value of early engagement with Schedule B Aboriginal Groups and undertook an Initial Consultation Phase prior to the Pre-Application Phase. Initiation of consultation with each Aboriginal Group is outlined in **Section 10.1.2.11**. During the Initial Consultation Phase, the Ministry consulted with all of the Aboriginal Groups later assigned to Schedule B of the section 11 Order.

At meetings with Aboriginal Groups during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Aboriginal Groups' use of the Project area for traditional purposes, or in the case of Tsawwassen First Nation for the exercise of treaty rights, and any concerns related to potential impacts on Aboriginal Interests. The Ministry also sought to determine community-specific preferences with respect to participation in Project consultation, EA review, and related activities. During initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

The Ministry provided Schedule B Aboriginal Groups with the following draft EA documents for review and comment:

- Project Description and Key Areas of Study
- Application Information Requirements
- Heritage Resources Overview Assessment
- Archaeological Heritage Resources Impact Assessment
- Aboriginal Consultation Plan

The Ministry considered sharing early drafts of key EA documents to Aboriginal Groups as an opportunity to:

- Acknowledge and respond, in part, to known concerns from Aboriginal groups regarding the high volume of project referrals, challenging timelines for review and limited resources to allocate to EA review processes;
- Meet the objective of sharing Project-related documents in a timely manner with the intent to facilitate Aboriginal Groups' review and comment;
- Consider and incorporate input, address concerns and identify gaps in relation to key aspects of the Project (e.g., Valued Components, studies and study area boundaries) prior to the Pre-Application Phase; and
- Allow time for meetings to be coordinated and conducted with Aboriginal Groups interested in detailed discussions regarding particular documents or aspect of the Project in advance of the Pre-Application Phase.

Meetings conducted with Schedule B Aboriginal Groups during the Initial Consultation Phase are listed in **Appendix 10-B Aboriginal Consultation Report 2**.

In addition to meetings with Chief and Council and/or Aboriginal Groups' staff, the Ministry also facilitated site visits and a community meeting; hosted a Project booth at an Aboriginal community event; and facilitated the participation of Aboriginal Groups' representatives in fieldwork.

During the Initial Consultation Phase, the Ministry also offered to meet with the Stō:Lò Nation and Stō:Lò Tribal Council. In May 2014, the Ministry received a deferral from the People of the River Office, representing member communities of the Stō:Lò Nation and Tribal Council. In January 2016, the People of the River Office advised EAO of their interest in deeper consultation given the decommissioning of the Tunnel component of the Project including the removal of sections of the Tunnel. As a result, EAO added the People of the River Office to Schedule C of the section 11 Order in March 2016.

Additional information regarding consultation activities undertaken during the Initial Consultation Phase are described in the Aboriginal Consultation Reports.

10.1.2.9 Overview of Consultation Activities - Pre-Application Phase Consultation

The Ministry met with all Schedule B Aboriginal Groups during the four month Pre-Application phase of the Project. Meetings are listed in **Appendix 10-B Aboriginal Consultation Report 2**.

Activities during this Phase included meetings with Chief and Council and/or Aboriginal groups' staff, site visits and community meetings; participation of Aboriginal Groups' representatives in fieldwork; and two Working Group meetings.

In April 2016, Schedule B Aboriginal Groups were invited to participate in river otter-related fieldwork. The objectives of this work were to document known or suspected river otter presence within the Regional Assessment Area, document and describe use of riparian areas and identify the potential for Project-related effects. This work was undertaken in response to Working Group comments raised by Musqueam in relation to the draft Application Information Requirements.

Working Group Meetings

The Ministry and Aboriginal Groups participated in two Working Group meetings during the Pre-Application Phase.

Working Group Meeting (January 21, 2016): *A one-day workshop with all members of Working Group. Discussions and presentations focused on:*

- EA Process
- Project overview and update
- Key Areas of Study
- Draft Application Information Requirements Overview
- Preliminary conclusions from study results to date

Working Group Meeting (March 10, 2016): *A one-day workshop with all members of Working Group. Discussions and presentations focused on:*

- EA Process
- List of materials available on Project website
- Review of comments received on, and resulting changes to, the draft Application Information Requirements
- Description and rationale of assessment areas

10.1.2.10 Overview of consultation with each Schedule B Aboriginal Group

The following section provides an overview of consultation activities undertaken with each Schedule B Aboriginal Group during the Initial Consultation and Pre-Application Phases. Additional information regarding consultation activities undertaken during the Initial Consultation Phase are described in Aboriginal Consultation Report #1 which is posted on EAO's website.

Cowichan Tribes

Cowichan Tribes engaged directly with the Ministry on the Project and also collectively with Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation as member nations of the Cowichan Nation Alliance. The Ministry provided information and funding directly to Cowichan Tribes. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribes represented Cowichan Nation Alliance in correspondence, meetings and fieldwork. As such, Cowichan Nation Alliance is only noted when Cowichan Tribes was not the Cowichan Nation Alliance representative.

Cowichan Tribes has actively engaged in consultation with the Ministry since early 2014.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Cowichan Tribes Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Cowichan Nation Alliance Study.

During initial discussions with Cowichan Tribes, and as demonstrated in the Consultation Plan and participation funding agreement with Cowichan Tribes, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Cowichan Tribes.

In addition to meetings with Cowichan Tribes representatives during the Initial Consultation Phase, Cowichan Tribes participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, proposed plans for Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Cowichan Tribes' Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During the Initial Consultation Phase, the Ministry sought Cowichan Tribes' input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Heritage Resources Overview Assessment
- Draft Archaeological Heritage Resources Impact Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Cowichan Tribes during this consultation Phase include:

- Introductory letter notifying Cowichan Tribes of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the draft Aboriginal Consultation Plan, the Ministry met with Cowichan Tribes and walked through these draft documents. Focused discussions were intended to explain the scope and content, to respond to any initial questions and to elicit input.

From the beginning of consultation, the Ministry worked with Cowichan Tribes to develop a mutually acceptable consultation approach, including the manner in which Cowichan Tribes was to be kept informed about the Project, and the means by which comments were to be communicated and addressed by the Ministry. Cowichan Tribes, representing Cowichan Nation Alliance, provided comments on the Draft Aboriginal Consultation Plan in a letter dated October 30 2015. These comments were summarized in Aboriginal Consultation Report #2.

Between early 2014 and May 2016, the Ministry and Cowichan Tribes discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. The Ministry met with Cowichan Tribes to discuss the scope of the Project, Project-related studies, Valued Components, mitigation, Project updates, EA process, Cowichan Tribes concerns, issues and Aboriginal Interests, and Project-related documents.

At meetings with Cowichan Tribes during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Cowichan Tribes' past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Cowichan Tribes's Aboriginal Interests. The Ministry also sought to determine Cowichan Tribes' preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this Phase, key topics and/or presentations covered during meetings with Cowichan Tribes included archaeology/heritage resources, wildlife, marine use, fish and fish habitat, traffic, human health (air and noise), river hydraulics and morphology, utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report, and the draft Application Information Requirements.

Documents and formal comments shared by Cowichan Tribes during this phase include:

- Ministry of Forests, Lands, and Natural Resource Operations' Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Proposed Studies (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Cowichan Tribes with funding for the submission of a traditional use study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015
- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015
- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

During the Pre-Application Phase, the Ministry met with Cowichan Tribes Chief and Council, staff and consultants; shared Project-related materials and draft documents for review and comment; and invited Cowichan Tribes to participate in fieldwork.

Cowichan Tribes shared the following documents with the Ministry:

- Environment Canada's Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Names (Working Group March 10, 2016)

During the Pre-Application Phase, the Ministry met three times with Cowichan Tribes and conducted a conference call in relation to Cowichan Tribes' interest in the procurement process and Project-related benefits and to discuss comments on the draft Part C content and Aboriginal Consultation Report 1.

During this phase, Cowichan Tribes was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Cowichan Tribes was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Cowichan Tribes reviewed and provided feedback on draft Part C content and Aboriginal Consultation Report 1. Where appropriate, revisions were made to these drafts based on the input received.

Cowichan Tribes communicated directly with EAO with respect to the EA process. EAO led two Working Group meetings noted in **Section 10.1.2.10**. Halalt represented Cowichan Nation Alliance at the first Working Group meeting. Halalt and Cowichan Tribes represented Cowichan Nation Alliance at the second Working Group meeting.

In addition, the Ministry undertook two meetings with the Cowichan Nation Alliance focused specifically on topics and content covered at each of the Working Group meetings. These were attended by Cowichan Tribes, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation.

Consultation efforts to date sought to identify and address concerns and issues raised by Cowichan Nation Alliance during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Halalt First Nation

Halalt First Nation engaged directly with the Ministry on the Project and also collectively with Cowichan Tribes, Penelakut Tribe and Stz'uminus First Nation as member nations of the Cowichan Nation Alliance. The Ministry provided information and funding directly to Cowichan Tribe. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribe represented Cowichan Nation Alliance in correspondence, meetings and fieldwork.

Halalt First Nation has actively engaged in consultation with the Ministry since early 2014.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Halalt First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Cowichan Nation Alliance Study.

During initial discussions with Halalt First Nation, and as demonstrated in the Consultation Plan and participation funding agreement with Halalt First Nation, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Halalt First Nation.

In addition to meetings with Halalt First Nation representatives during the Initial Consultation Phase, Halalt First Nation participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, proposed plans for Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Halalt First Nation's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During the Initial Consultation Phase, the Ministry sought Halalt First Nation's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Heritage Resources Overview Assessment
- Draft Archaeological Heritage Resources Impact Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Halalt First Nation during this consultation Phase include:

- Introductory letter notifying Halalt First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

The Ministry met with Cowichan Nation Alliance to review all documents except the Aboriginal Consultation Plan. Focused discussions were intended to explain the scope and content, to respond to any initial questions and to elicit input.

From the beginning of consultation, the Ministry worked with Halalt First Nation to develop a mutually acceptable consultation approach, including the manner in which Halalt First Nation was to be kept informed about the Project, and the means by which comments were to be communicated and addressed by the Ministry. Cowichan Nation Alliance provided comments on the Draft Aboriginal Consultation Plan in a letter dated October 30 2015. These comments were summarized in Aboriginal Consultation Report #2.

Between early 2014 and May 2016, the Ministry and Halalt First Nation and Cowichan Nation Alliance discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. The Ministry met with Cowichan Nation Alliance to discuss the scope of the Project, Project-related studies, Valued Components, mitigation, Project updates, EA process, Halalt First Nation concerns, issues and Aboriginal Interests, and Project-related documents.

At meetings with Halalt First Nation and Cowichan Nation Alliance during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Halalt First Nation's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Halalt First Nation's Aboriginal Interests. The Ministry also sought to determine Halalt First Nation's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this Phase, key topics and/or presentations covered during meetings with Halalt First Nation included archaeology/heritage resources, wildlife, marine use, fish and fish habitat, traffic, human health (air and noise), river hydraulics and morphology, utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report, and the draft Application Information Requirements.

Documents and formal comments shared by Halalt First Nation during this phase include:

- Ministry of Forests, Lands, and Natural Resource Operations' Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Proposed Studies (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Halalt First Nation with funding for the submission of a traditional use study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015

- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015
- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

During the Pre-Application Phase, the Ministry met with Halalt First Nation Chief and Council, staff and consultants and Cowichan Nation Alliance representatives; shared Project-related materials and draft documents for review and comment; and invited Halalt First Nation to participate in fieldwork.

Halalt First Nation shared the following documents with the Ministry:

- Environment Canada's Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Names (Working Group March 10, 2016)

During the Pre-Application Phase, the Ministry met three times with Cowichan Nation Alliance. Halalt First Nation attended two of those meetings. The Ministry also conducted a conference call in relation to Halalt First Nation's interest in the procurement process and Project-related benefits and to discuss comments on the draft Part C content and Aboriginal Consultation Report 1. Cowichan Nation Alliance represented Halalt First Nation on that call.

During this phase, Halalt First Nation was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Halalt First Nation was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Cowichan Nation Alliance provided feedback on draft Part C content and Aboriginal Consultation Report 1. Where appropriate, revisions were made to these drafts based on the input received.

Halalt First Nation communicated directly with EAO with respect to the EA process. EAO led two Working Group meetings noted in **Section 10.1.2.10**. Halalt First Nation represented Cowichan Nation Alliance at the first Working Group meeting. Cowichan Tribes and Halalt First Nation represented Cowichan Nation Alliance at the second Working Group meeting.

In addition, the Ministry undertook two meetings with the Cowichan Nation Alliance focused specifically on topics and content covered at each of the Working Group meetings. These were attended by Cowichan Tribe, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation.

Consultation efforts to date sought to identify and address concerns and issues raised by Cowichan Nation Alliance during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-C Aboriginal Consultation Report 2**).

Hwlitsum

The Province is aware that Hwlitsum has asserted that it is an Aboriginal group independent of the Penelakut Tribe, and has commenced an action in the British Columbia Supreme Court in which this issue arises. The Province considers Hwlitsum to be a family group/component of the Penelakut Tribe. However, to ensure that all information that may be applicable to the Penelakut and its components is available and considered, as appropriate, EAO invited Hwlitsum to participate as a Working Group member for the EA, and directed the Ministry to consult with Hwlitsum as per the section 11 Order.

Hwlitsum has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Initially, Hwlitsum was affiliated with the Cowichan Nation Alliance and participated in Project consultation as a member of the Alliance. In fall 2014, Hwlitsum indicated that they would engage with the Ministry directly. Between early 2014 and May 2016, the Ministry and Hwlitsum discussed and exchanged Project-related information through emails, phone calls, letters, a community meeting and in-person meetings.

From the beginning of consultation, the Ministry worked with Hwlitsum to develop a mutually acceptable consultation approach, including the manner in which Hwlitsum was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

During initial discussions with Hwlitsum, and as demonstrated in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Hwlitsum.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, Hwlitsum's past, present and future desired use of the Project area for the exercise of identified Aboriginal Interests, identification of potential impacts on Hwlitsum's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During Initial Consultation meetings, Hwlitsum identified the need for capacity funding to support Hwlitsum's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. Hwlitsum also identified the need for funding for a Hwlitsum Study. The Ministry and Hwlitsum worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Hwlitsum's review and comment. Hwlitsum submitted a study entitled "Hwlitsum Traditional Use and Occupancy Study 2015".

At meetings with Hwlitsum during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Hwlitsum's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Hwlitsum's Aboriginal Interests. The Ministry also sought to determine Hwlitsum's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

In support of consultation, the following Ministry-led activities have been undertaken with Hwlitsum during these phases:

- Meetings with Hwlitsum Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;

- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and an Hwlitsum Study.

During this period, key topics and/or presentations covered during meetings with Hwlitsum include: Archaeology/Heritage Resources, Marine Use, Fish and Fish Habitat, River Hydraulics and Morphology, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

During the Initial Consultation Phase, the Ministry sought Hwlitsum's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Hwlitsum during this consultation Phase include:

- Introductory letter notifying Hwlitsum of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the draft Aboriginal Consultation Plan, the Ministry met with Hwlitsum and walked through these draft documents. Focused discussions on these documents were intended to explain the scope and content, to respond to any initial questions and to elicit input. Hwlitsum submitted comments on the draft Heritage Resources Overview Assessment for the Project via letter/email dated December 12, 2014.

During the Pre-Application Phase, the Ministry held a community meeting with Hwlitsum. At the request of Hwlitsum, the Project team provided an overview of the Project (scope, components, schedule, EA process) and a focused presentation on fish and fish habitat.

During this phase, Hwlitsum was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Hwlitsum was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

The Ministry provided draft Consultation Report 1 to Hwlitsum for review and comment prior to finalization and submission to EAO indicating that feedback received by May 2, 2106, would be incorporated into the final version as appropriate. Draft Part C content was also provided. Hwlitsum provided comments on the Aboriginal Consultation Report 1 and Draft Part C content on May 10, 2016. Where appropriate, revisions were made to these drafts based on the input received.

Hwlitsum attended two EAO-led Working Group meetings and had communications directly with EAO with respect to the EA process.

Consultation efforts to date sought to identify and address concerns and issues raised by Hwlitsum raised by Hwlitsum during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Katzie First Nation

Katzie First Nation (Katzie) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Between early 2014 and May 2016, the Ministry and the Katzie First Nation discussed and exchanged Project-related information through emails, phone calls, letters and meetings.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Katzie First Nation Chief and Council, staff and consultants;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Katzie First Nation Study.

Letters sent to Katzie First Nation during this consultation Phase include:

- Introductory letter notifying Katzie First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

During initial discussions with Katzie, and as demonstrated in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Katzie.

At meetings with Katzie during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Katzie's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests and any concerns related to potential impacts on Katzie's Aboriginal Interests.

From the beginning of consultation, the Ministry worked with Katzie to develop a mutually acceptable consultation approach, including the manner in which Katzie was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

During this period, key topics and/or presentations covered during meetings with Katzie include: archaeology/heritage resources, wildlife, marine use, fish and fish habitat, traffic, human health (air and noise), river hydraulics and morphology, utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report, and the draft Application Information Requirements.

The Ministry met with Katzie and walked through the draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input. Katzie First Nation submitted comments on the Draft Aboriginal Consultation Plan in a November 20, 2015 letter/email.

During the Pre-Application Phase, the Ministry met twice with Katzie. A key topic of interest was procurement and Project related benefits. EAO invited Katzie to two EAO-led Working Group meetings, but Katzie did not attend.

During this phase, Katzie was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Katzie was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report 2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Katzie reviewed draft Aboriginal Consultation Report 1 and draft Part C content and had no comments or concerns.

On May 18 2016, the Ministry received a letter from Katzie, Kwantlen and Semiahmoo First Nations expressing concern with the Project's procurement strategy and requesting further dialogue with respect to business opportunities. The Ministry will continue to work with Katzie, Kwantlen and Semiahmoo First Nations to address this and any other Project-related concerns.

Consultation efforts to date sought to identify and address concerns and issues raised by Katzie during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Kwantlen First Nation

Kwantlen First Nation (Kwantlen) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Between early 2014 and May 2016, the Ministry and the Kwantlen First Nation discussed and exchanged Project-related information through emails, phone calls, letters and meetings.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Kwantlen First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Kwantlen First Nation Study.

Letters sent to Kwantlen First Nation during this consultation Phase include:

- Introductory letter notifying Kwantlen First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

During initial discussions with Kwantlen First Nation, and as demonstrated in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Kwantlen.

During Initial Consultation meetings, Kwantlen identified the need for capacity funding to support Kwantlen's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. Kwantlen First Nation also identified the need for funding for a Kwantlen First Nation traditional use study. The Ministry and Kwantlen worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Kwantlen's review and comment. Kwantlen submitted a Study entitled Kwantlen Land Use and Occupation in the Vicinity of Highway 99.

At meetings with Kwantlen First Nation during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Kwantlen's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests and any concerns related to potential impacts on Kwantlen's Aboriginal Interests. The Ministry also sought to determine Kwantlen's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this period, key topics and/or presentations covered during meetings with Kwantlen include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

During the Initial Consultation Phase, the Ministry sought Kwantlen's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Kwantlen First Nation during this consultation Phase include:

- Introductory letter notifying Kwantlen First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the Draft Consultation Plan, the Ministry met with Kwantlen and walked through the draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input.

During the Pre-Application Phase, the Ministry met twice with Kwantlen First Nation. A key topic of interest was procurement and Project related benefits. Kwantlen First Nation has participated in two EAO-led Working Group meetings.

In April 2016, Kwantlen First Nation participated in river otter-related fieldwork. The objectives of this work were to document known or suspected river otter presence within the Regional Assessment Area, document and describe use of riparian areas and identify the potential for Project-related effects.

During this phase, Kwantlen was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Kwantlen was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report 2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Kwantlen reviewed and provided comments on Part C of the Application and draft Aboriginal Consultation Report #1. Where appropriate, revisions were made to these drafts based on the input received.

On May 18 2016, the Ministry received a letter from Kwantlen, Katzie and Semiahmoo First Nations expressing concern with the Project's procurement strategy and requesting further dialogue with respect to business opportunities. The Ministry will continue to work with Kwantlen, Katzie and Semiahmoo First Nations through the Application Review Phase to address this and any other Project-related concerns.

Consultation efforts to date sought to identify and address concerns and issues raised by Kwantlen during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Lake Cowichan First Nation

Lake Cowichan First Nation (Lake Cowichan) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Between early 2014 and May 2016, the Ministry and the Lake Cowichan First Nation discussed and exchanged Project-related information through emails, phone calls, and meetings. Lyackson First Nation and Lake Cowichan First Nation have been working together on this Project and as such, the summary of meetings has been recorded to reflect this engagement approach.

In support of consultation, the following Ministry-led activities have been undertaken with Lake Cowichan First Nation:

- Meetings with Lake Cowichan First Nation Chief and Council, staff and consultants;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Lake Cowichan First Nation Study.

During initial discussions with Lake Cowichan First Nation, and as demonstrated in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Lake Cowichan. From the beginning of consultation, the Ministry worked with Lake Cowichan to develop a mutually acceptable consultation approach, including the manner in which Lake Cowichan was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

At meetings with Lake Cowichan First Nation during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Lake Cowichan's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests and any concerns related to potential impacts on Lake Cowichan's Aboriginal Interests. The Ministry also sought to determine Lake Cowichan's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this period, key topics and/or presentations covered during meetings with Lake Cowichan include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements

During the Initial Consultation Phase, the Ministry sought Lake Cowichan's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Lake Cowichan First Nation during this consultation Phase include:

- Introductory letter notifying Lake Cowichan First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the Draft Consultation Plan, the Ministry met with Lake Cowichan and walked through the draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input. Lake Cowichan First Nation reviewed, but did not comment on, the Draft Aboriginal Consultation Plan.

During the Pre-Application Phase, the Ministry met three times with Lake Cowichan First Nation representatives. Lake Cowichan First Nation was invited to participate in the EAO-led Working Group, but did not attend the two meetings during this Phase.

During this phase, Lake Cowichan was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Lake Cowichan was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report 2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Lake Cowichan's feedback on Aboriginal Consultation Report #1 was provided during a meeting with Lyackson First Nation. Lake Cowichan First Nation reviewed draft Part C content and had no comments or concerns.

Consultation efforts to date sought to identify and address concerns and issues raised by Lake Cowichan during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Lyackson First Nation

Lyackson First Nation (Lyackson) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports. Lyackson First Nation and Lake Cowichan First Nation have worked together on this Project and this is reflected in both the summary of meetings and of the concerns/issues raised to date.

The Ministry initiated consultation with Lyackson in early 2014. Between early 2014 and May 2016, the Ministry and the Lyackson discussed and exchanged Project-related information through emails, phone calls, and meetings. In support of consultation, the following Ministry-led activities have been undertaken with Lyackson First Nation during these phases:

- Meetings with Lyackson First Nation staff and consultants;
- Two site visits (general and for Lyackson elders);
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Lyackson First Nation Study.

From the beginning of consultation, the Ministry worked with Lyackson to develop a mutually acceptable consultation approach, including the manner in which Lyackson was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

During Initial Consultation meetings, Lyackson identified the need for capacity funding to support Lyackson's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. Lyackson First Nation also identified the need for funding for a Lyackson First Nation traditional use study. The Ministry and Lyackson worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Lyackson's review and comment. Lyackson submitted a Study entitled, Preliminary Lyackson Use and Occupancy Mapping Study for BC MOTI's George Massey Tunnel Replacement Project.

During initial discussions with Lyackson First Nation, and as demonstrated in the Consultation Plan and Lyackson/GMT Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Lyackson.

At meetings with Lyackson First Nation during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Lyackson's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests and any concerns related to potential impacts on Lyackson's Aboriginal Interests. The Ministry also sought to determine Lyackson's preferences with respect to participation in Project consultation, EA review, and related activities.

During this period, key topics and/or presentations covered during meetings with Lyackson include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

During the Initial Consultation Phase, the Ministry sought Lyackson's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment

- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Lyackson First Nation during this consultation Phase include:

- Introductory letter notifying Lyackson First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the Draft Consultation Plan, the Ministry met with Lyackson and walked through the draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input. Where Aboriginal Groups comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Based on feedback received to date and discussions with Lyackson on this matter, the Ministry is of the understanding that Lyackson First Nation has no outstanding concerns or comments with respect to the Plan.

During the Pre-Application Phase, the Ministry met three times with Lyackson First Nation. Lyackson First Nation participated in two EAO-led Working Group meetings.

In addition, Lyackson elders participated in a site visit that had been requested in the Working Group meeting. The site visit covered key Project components, provided an opportunity for mutual sharing of information and knowledge, and allowed for Lyackson representatives to ask questions about the Project.

During this phase, Lyackson was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Lyackson was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Lyackson commented on the draft Application Information Requirements through the Working Group and provided comments on the draft content of Part C during an April 27, 2016 meeting with the Ministry. Changes to Part C content were made based on Lyackson's input. Lyackson advised the Ministry that they had no comments on draft Aboriginal Consultation Report #1.

Consultation efforts to date sought to identify and address concerns and issues raised by Lyackson during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Musqueam Indian Band

The Ministry initiated consultation with Musqueam Indian Band (Musqueam) in early 2013. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Between early 2013 and May 2016, the Ministry and Musqueam discussed and exchanged Project-related information through emails, phone calls, letters and meetings. From the beginning of consultation, the Ministry worked with Musqueam in an effort to develop a mutually acceptable consultation approach, including the manner in which Musqueam was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

During initial discussions with Musqueam, and as demonstrated in the Consultation Plan and Musqueam/GMT Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Musqueam. During Initial Consultation meetings, Musqueam identified the need for capacity funding to support Musqueam's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. Musqueam also identified the need for funding for a Musqueam traditional use study. The Ministry and Musqueam worked together to finalize a funding agreement. The agreement specifies the Initial Consultation and Pre-Application Phase activities covered under the agreement and Project/EA-related documents for MIB's review and comment. On November 17, 2015, Musqueam submitted a study, "Salmon So Thick, That You Could Walk on Water: Preliminary Scope of Musqueam Components for the Environmental Impact Assessment of the Proposed George Massey Tunnel Replacement Project".

Consultation activities during this period were focused on the Project scope and schedule, proposed Studies/Valued Components, understanding Musqueam's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and the identification of potential impacts on Musqueam's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects. The Ministry also sought to determine Musqueam's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

In support of consultation, the following Ministry-led activities have been undertaken with Musqueam during these phases:

- Meetings with Musqueam Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Project booth at Musqueam Aboriginal Day event; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Musqueam Study.

During this period, key topics and/or presentations covered during activities with Musqueam include: archaeology/heritage resources; wildlife; marine use, fish and fish habitat; traffic; human health (air and noise); river hydraulics and morphology; utilities; and the Green Slough concept.

The Ministry sought Musqueam's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Musqueam Indian Band during this consultation Phase include:

- Introductory letter notifying Musqueam Indian Band of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and

- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the draft Aboriginal Consultation Plan, the Ministry met with Musqueam to discuss these documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input Musqueam's comments. Musqueam provided comments on the Draft Consultation Plan via email on November 6, 2015. Where Musqueam's comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Musqueam has not responded to the Ministry's email (March 09, 2015) outlining changes to the Plan resulting from Musqueam's input or to the offer to meet to discuss the Plan.

During the Pre-Application Phase, the Ministry met twice with Musqueam. Musqueam attended two EAO-led Working Group meetings and met one-on-one with EAO with respect to the EA process.

In April 2016, Musqueam was invited to participate in river otter-related fieldwork. The objectives of this work were to document known or suspected river otter presence within the Regional Assessment Area, document and describe use of riparian areas and identify the potential for Project-related effects. This work was undertaken in response to Working Group comments raised by Musqueam in relation to the dAIR. Musqueam did not participate in this fieldwork opportunity.

During this phase, Musqueam was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Musqueam was provided Draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

The Ministry provided draft Consultation Report #1 to Musqueam for review and comment prior to finalization and submission to EAO, indicating that feedback received by May 2, 2106, would be incorporated into the final version as appropriate. Musqueam requested an extension to provide comments. Musqueam provided comments on the draft Consultation Report related to its content and format, and requested that a separate Musqueam-specific report be prepared that is reflective of Musqueam's perspective regarding the consultation undertaken to date. Aboriginal Consultation Report #2 provides Musqueam-specific content and is inclusive of Musqueam's perspective on consultation undertaken to date. Where appropriate, comments received on Report #2 will be incorporated into the revised document.

Musqueam also provided comments on draft Part C content of the Application. Based on input provided by Musqueam and where appropriate, changes to this content have been made.

During the Pre-Application Phase, Musqueam submitted a letter to the Ministry in relation to the use of Musqueam information (March 17, 2016). The Ministry responded to Musqueam in a meeting on April 13, 2016, and also via letter dated April 20, 2016 addressing questions and concerns with respect to the appropriate use of Musqueam information.

On May 19, 2016, Musqueam submitted a draft Memorandum of Understanding (MOU) to the Ministry in relation to the Project. The Ministry is committed to working with Musqueam with respect to the draft MOU, to continued consultation and to a positive, mutually respectful and productive relationship on this Project.

Consultation efforts to date have sought to identify and address concerns and issues raised by Musqueam during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Penelakut Tribe

Penelakut Tribe engaged directly with the Ministry on the Project and also collectively with Cowichan Tribes, Penelakut Tribe and Stz'uminus First Nation as member nations of the Cowichan Nation Alliance. The Ministry provided information and funding directly to Cowichan Tribe. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribe represented Cowichan Nation Alliance in correspondence, meetings and fieldwork.

Penelakut Tribe has actively engaged in consultation with the Ministry since early 2014.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Penelakut Tribe Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Cowichan Nation Alliance Study.

During initial discussions with Penelakut Tribe, and as demonstrated in the Consultation Plan and participation funding agreement with Penelakut Tribe, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Penelakut Tribe.

In addition to meetings with Penelakut Tribe representatives during the Initial Consultation Phase, Penelakut Tribe participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, proposed plans for Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Penelakut Tribe's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During the Initial Consultation Phase, the Ministry sought Penelakut Tribe's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Heritage Resources Overview Assessment
- Draft Archaeological Heritage Resources Impact Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Penelakut Tribe during this consultation Phase include:

- Introductory letter notifying Penelakut Tribe of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

The Ministry met with Cowichan Nation Alliance to review all documents except the Aboriginal Consultation Plan. Focused discussions were intended to explain the scope and content, to respond to any initial questions and to elicit input.

From the beginning of consultation, the Ministry worked with Penelakut Tribe to develop a mutually acceptable consultation approach, including the manner in which Penelakut Tribe was to be kept informed about the Project, and the means by which comments were to be communicated and addressed by the Ministry. Cowichan Nation Alliance provided comments on the Draft Aboriginal Consultation Plan in a letter dated October 30 2015. These comments were summarized in Aboriginal Consultation Report #2.

Between early 2014 and May 2016, the Ministry and Penelakut Tribe and Cowichan Nation Alliance discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. The Ministry met with Cowichan Nation Alliance to discuss the scope of the Project, Project-related studies, Valued Components, mitigation, Project updates, EA process, Penelakut Tribe concerns, issues and Aboriginal Interests, and Project-related documents.

At meetings with Penelakut Tribe and Cowichan Nation Alliance during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Penelakut Tribe's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Penelakut Tribe's Aboriginal Interests. The Ministry also sought to determine Penelakut Tribe's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this Phase, key topics and/or presentations covered during meetings with Penelakut Tribe included archaeology/heritage resources, wildlife, marine use, fish and fish habitat, traffic, human health (air and noise), river hydraulics and morphology, utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report, and the draft Application Information Requirements.

Documents and formal comments shared by Penelakut Tribe during this phase include:

- Ministry of Forests, Lands, and Natural Resource Operations' Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Proposed Studies (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Penelakut Tribe with funding for the submission of a traditional use study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015
- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015
- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

During the Pre-Application Phase, the Ministry met with Penelakut Tribe Chief and Council, staff and consultants and Cowichan Nation Alliance representatives; shared Project-related materials and draft documents for review and comment; and invited Penelakut Tribe to participate in fieldwork.

Penelakut Tribe shared the following documents with the Ministry:

- Environment Canada's Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Names (Working Group March 10, 2016)

During the Pre-Application Phase, the Ministry met three times with Cowichan Nation Alliance. Penelakut Tribe attended one of those meetings. The Ministry also conducted a conference call in relation to Penelakut Tribe's interest in the procurement process and Project-related benefits and to discuss comments on the draft Part C content and Aboriginal Consultation Report 1. Cowichan Nation Alliance represented Penelakut Tribe on that call.

During this phase, Penelakut Tribe was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Penelakut Tribe was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Cowichan Nation Alliance provided feedback on draft Part C content and Aboriginal Consultation Report 1. Where appropriate, revisions were made to these drafts based on the input received.

Penelakut Tribe communicated directly with EAO with respect to the EA process. EAO led two Working Group meetings noted in **Section 10.1.2.10**. Halalt First Nation represented Cowichan Nation Alliance at the first Working Group meeting. Cowichan Tribes and Halalt First Nation represented Cowichan Nation Alliance at the second Working Group meeting.

In addition, the Ministry undertook two meetings with the Cowichan Nation Alliance focused specifically on topics and content covered at each of the Working Group meetings. These were attended by Cowichan Tribe, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation.

Consultation efforts to date sought to identify and address concerns and issues raised by Cowichan Nation Alliance during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-C Aboriginal Consultation Report 2**).

Semiahmoo First Nation

Semiahmoo First Nation (Seamiahmoo) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

The Ministry initiated consultation with Semiahmoo in early 2014. In support of consultation, the following Ministry-led activities have been undertaken with Semiahmoo during these phases:

- Meetings with Semiahmoo First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Semiahmoo First Nation Study.

During initial discussions with Semiahmoo, and as demonstrated in the Consultation Plan and Semiahmoo/GMT Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Semiahmoo.

During Initial Consultation meetings, Semiahmoo identified the need for capacity funding to support Semiahmoo's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. Semiahmoo also identified the need for funding for a Semiahmoo First Nation traditional use study and the Ministry and Semiahmoo worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Semiahmoo's review and comment. Semiahmoo did not submit a traditional use study.

Between early 2014 and May 2016, the Ministry and Semiahmoo discussed and exchanged Project-related information through emails, letters, phone calls and meetings.

At meetings with Semiahmoo during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Semiahmoo's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Semiahmoo's Aboriginal Interests. The Ministry also sought to determine Semiahmoo's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this period, key topics and/or presentations covered during activities with Semiahmoo include: archaeology/heritage resources; wildlife; marine use, fish and fish habitat; traffic; human health (air and noise); river hydraulics and morphology; utilities; and the Green Slough concept.

In addition to meetings with Semiahmoo representatives during the Initial Consultation Phase, Semiahmoo was invited to participate in a site visit which focused on key Project components, mutual sharing of information, plans for tunnel decommissioning, Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

During the Initial Consultation Phase, the Ministry sought Semiahmoo's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Semiahmoo during this consultation Phase include:

- Introductory letter notifying Semiahmoo First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

The Ministry met with Semiahmoo and walked through the draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input.

The Consultation Plan was revised, based on input received from Semiahmoo and other Aboriginal Groups, and approved by EAO on April 6, 2016. Semiahmoo submitted a letter to the Ministry on October 28, 2015 indicating that funding was required for the duration of the Plan, expressing concerns with the Project's procurement process and requesting specific provisions within the procurement process in relation to Aboriginal participation. The Ministry met with Semiahmoo to discuss these concerns and will continue to work with Semiahmoo in an effort to address any outstanding Project-related issues.

During the Pre-Application Phase, Semiahmoo met with the Ministry twice. A key topic of interest was procurement and Project related benefits. Semiahmoo participated in the EAO-led Working Group.

During this phase, Semiahmoo was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Semiahmoo First Nation was also provided Draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

The Ministry provided draft Consultation Report #1 to Semiahmoo for review and comment prior to finalization and submission to EAO and indicated that feedback received by May 2, 2016 would be incorporated into the final version as appropriate. Semiahmoo indicated that they would not provide comments on these draft documents due to concerns related to the Ministry's approach to Project procurement.

On May 18 2016, the Ministry received a letter from Semiahmoo, Katzie and Kwantlen First Nations expressing concern with the Project's procurement strategy and requesting further dialogue with respect to business opportunities. The Ministry will continue to work with Semiahmoo, Katzie and Kwantlen First Nation to address this and any other Project-related concerns.

Consultation efforts to date sought to identify, address and resolve concerns and issues raised by Semiahmoo. The concerns, issues and interests raised by Semiahmoo during the Initial Consultation and Pre-Application Phases are summarized in **Appendix 10-B Aboriginal Consultation Report 2**.

Squamish Nation

The Ministry initiated consultation with Squamish First Nation (Squamish) in early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

In support of consultation, the following Ministry-led activities have been undertaken with Squamish Nation:

- Meetings with Squamish Nation staff and consultants;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Squamish Nation report.

The Ministry has worked with Squamish Nation with respect to determining a mutually acceptable consultation approach, including the manner in which Squamish Nation is to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) are to be communicated and addressed by the Ministry.

During discussions with Squamish Nation, and as demonstrated in the Consultation Plan and Squamish Nation/GMT Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Squamish Nation.

Between early 2014 and May 2016, the Ministry and the Squamish Nation discussed and exchanged Project-related information through emails, phone calls, letters and meetings. At meetings with Squamish Nation during this Phase, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Squamish Nation's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Squamish Nation's Aboriginal Interests.

During this period, consultation with Squamish Nation focused on: Archaeology/Heritage Resources, Marine Use, Fish and Fish Habitat, River Hydraulics and Morphology, Green Slough concept, Project Description and Key Areas of Study document and the Draft Application Information Requirements.

During the Initial Consultation Phase, the Ministry sought Squamish Nation's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Squamish Nation during this consultation Phase include:

- Introductory letter notifying Squamish Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

In a December 2015 letter to the Ministry, the Squamish Nation identified the need for capacity funding to support Squamish Nation's involvement in Project consultation activities, review of EA-related documents and participation in the Pre-Application phase of the EA process. The letter also indicated that Squamish Nation is concerned that the Project could potentially impact their fishing rights on the Fraser River.

On February 2, 2016, the Ministry responded to the letter indicating that the Ministry would follow up with Squamish upon issuance, by EAO, of the final section 11 Order. The section 11 Order assigned Squamish to Schedule B. Squamish Nation was invited to two EAO-led Working Group meetings and has had communications directly with EAO with respect to the EA process. Squamish did not attend either of the two Working Group meetings for the Project.

During consultation, Squamish Nation identified the need for funding for a Squamish Nation Study. The Ministry and Squamish Nation worked together to finalize a funding agreement.

During the Pre-Application phase, Squamish was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Squamish was also provided Draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report 2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Squamish Nation reviewed draft Aboriginal Consultation Report #1 and had no comments on the document. Squamish also reviewed and commented on draft Part C content of the Application. The draft content was revised in response to input received.

Consultation efforts to date sought to identify and address concerns and issues raised by Squamish during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Stzùminus First Nation

Stzùminus First Nation engaged directly with the Ministry on the Project and also collectively with Cowichan Tribes, Penelakut Tribe and Stz'uminus First Nation as member nations of the Cowichan Nation Alliance. The Ministry provided information and funding directly to Cowichan Tribe. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribe represented Cowichan Nation Alliance in correspondence, meetings and fieldwork.

Stzùminus First Nation has actively engaged in consultation with the Ministry since early 2014.

During the Initial Consultation Phase, consultation activities included:

- Meetings with Stzùminus First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment; and
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Cowichan Nation Alliance Study.

During initial discussions with Stzùminus First Nation, and as demonstrated in the Consultation Plan and participation funding agreement with Stzùminus First Nation, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Stzùminus First Nation.

In addition to meetings with Stzùminus First Nation representatives during the Initial Consultation Phase, Stzùminus First Nation participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, proposed plans for Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Stzùminus First Nation's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During the Initial Consultation Phase, the Ministry sought Stzùminus First Nation's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Heritage Resources Overview Assessment
- Draft Archaeological Heritage Resources Impact Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Stzùminus First Nation during this consultation Phase include:

- Introductory letter notifying Stzùminus First Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

The Ministry met with Cowichan Nation Alliance to review all documents except the Aboriginal Consultation Plan. Focused discussions were intended to explain the scope and content, to respond to any initial questions and to elicit input.

From the beginning of consultation, the Ministry worked with Stzùminus First Nation to develop a mutually acceptable consultation approach, including the manner in which Stzùminus First Nation was to be kept informed about the Project, and the means by which comments were to be communicated and addressed by the Ministry. Cowichan Nation Alliance provided comments on the Draft Aboriginal Consultation Plan in a letter dated October 30 2015. These comments were summarized in Aboriginal Consultation Report #2.

Between early 2014 and May 2016, the Ministry and Stzùminus First Nation and Cowichan Nation Alliance discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. The Ministry met with Cowichan Nation Alliance to discuss the scope of the Project, Project-related studies, Valued Components, mitigation, Project updates, EA process, Stzùminus First Nation concerns, issues and Aboriginal Interests, and Project-related documents.

At meetings with Stzùminus First Nation and Cowichan Nation Alliance during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Stzùminus First Nation's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Stzùminus First Nation's Aboriginal Interests. The Ministry also sought to determine Stzùminus First Nation's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this Phase, key topics and/or presentations covered during meetings with Stzùminus First Nation included archaeology/heritage resources, wildlife, marine use, fish and fish habitat, traffic, human health (air and noise), river hydraulics and morphology, utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report, and the draft Application Information Requirements.

Documents and formal comments shared by Stzùminus First Nation during this phase include:

- Ministry of Forests, Lands, and Natural Resource Operations' Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Proposed Studies (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Stzùminus First Nation with funding for the submission of a traditional use study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015
- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015
- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

During the Pre-Application Phase, the Ministry met with Stzùminus First Nation Chief and Council, staff and consultants and Cowichan Nation Alliance representatives; shared Project-related materials and draft documents for review and comment; and invited Stzùminus First Nation to participate in fieldwork.

Stzùminus First Nation shared the following documents with the Ministry:

- Environment Canada's Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Names (Working Group March 10, 2016)

During the Pre-Application Phase, the Ministry met three times with Cowichan Nation Alliance. Stzùminus First Nation attended one of those meetings. The Ministry also conducted a conference call in relation to Stzùminus First Nation's interest in the procurement process and Project-related benefits and to discuss comments on the draft Part C content and Aboriginal Consultation Report 1. Cowichan Nation Alliance represented Stzùminus First Nation on that call.

During this phase, Stzùminus First Nation was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Stz'uminus First Nation was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Cowichan Nation Alliance provided feedback on draft Part C content and Aboriginal Consultation Report 1. Where appropriate, revisions were made to these drafts based on the input received.

Stz'uminus First Nation communicated directly with EAO with respect to the EA process. EAO led two Working Group meetings noted in **Section 10.1.2.10**. Halalt First Nation represented Cowichan Nation Alliance at the first Working Group meeting. Cowichan Tribes and Halalt First Nation represented Cowichan Nation Alliance at the second Working Group meeting.

In addition, the Ministry undertook two meetings with the Cowichan Nation Alliance focused specifically on topics and content covered at each of the Working Group meetings. These were attended by Cowichan Tribe, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation.

Consultation efforts to date sought to identify and address concerns and issues raised by Cowichan Nation Alliance during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-C Aboriginal Consultation Report 2**).

Tsawwassen First Nation

Tsawwassen First Nation (Tsawwassen) has actively engaged in consultation with the Ministry since late 2012. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

Between early 2012 and May 2016, the Ministry and Tsawwassen discussed and exchanged Project-related information through emails, phone calls, letters and meetings.

During the Initial Consultation Phase, the Ministry sought Tsawwassen’s input on the following EA-related documents:

- Meetings with Tsawwassen First Nation Chief and Council, staff and consultants;
- Community meeting
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Tsawwassen Project Impact Study.

During initial discussions with Tsawwassen, and as demonstrated in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Tsawwassen.

In December 2014, the Ministry conducted a Tsawwassen community meeting. The Ministry presented on various aspects of the Project including the scope and key components, schedule and proposed studies.

During this period, key topics and/or presentations covered during meetings with Tsawwassen include: Project scope and schedule, Tsawwassen’s concerns/interests and Tsawwassen’s past, present and desired future use of the Project area for the exercise of Aboriginal Interests, EA Process, Consultation with Tsawwassen, Archaeology/Heritage Resources, Wildlife, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

In addition to meetings with Tsawwassen representatives during the Initial Consultation Phase, Tsawwassen participated in a site visit which focused on key Project components, mutual sharing of information plans for tunnel decommissioning, Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

During the Initial Consultation Phase, the Ministry sought Tsawwassen’s input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Tsawwassen First Nation during this consultation Phase include:

- Introductory letter notifying Squamish Nation of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

With the exception of the Draft Aboriginal Consultation Plan, the Ministry met with TFN and walked through the above- listed draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input. TFN request one change to the draft Aboriginal Consultation Plan. The Ministry revised the Plan to reflect the requested edit.

During the Pre-Application Phase, the Ministry met three times with Tsawwassen. These meetings included a review of information shared at Working Group #2, a Project update and a discussion regarding GMT procurement and a meeting to discuss draft Aboriginal Consultation Plan 1 and draft Part C content. A meeting was also held with Tsawwassen's Natural Resources Committee with a focus on the fish and fish habitat assessment. During this Phase, Tsawwassen attended one EAO-led Working Group meeting and has met one-on-one with EAO with respect to the EA process.

During this phase, Tsawwassen was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Tsawwassen was also provided with draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report #2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Tsawwassen First Nation reviewed draft Aboriginal Consultation Report 1 and draft Part C content and had no comments or concerns.

Consultation efforts to date sought to identify and address concerns and issues raised by Tsawwassen during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

Tsleil-Waututh Nation

Tsleil-Waututh First Nation (Tsleil-Waututh) has actively engaged in consultation with the Ministry since early 2014. Meetings for all phases of consultation are listed in the Aboriginal Consultation Reports.

The Ministry initiated consultation with Tsleil-Waututh Nation in early 2014. In support of consultation, the following Ministry-led activities have been undertaken with Tsleil-Waututh Nation during these phases:

- Meetings with Tsleil-Waututh Nation staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of comments and a Tsleil-Waututh Nation Knowledge Study.

From the beginning of consultation, the Ministry worked with Tsleil-Waututh to develop a mutually acceptable consultation approach, including the manner in which Tsleil-Waututh was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry. Tsleil-Waututh provided the Ministry with the Tsleil-Waututh Stewardship Policy (2009) which outlines Tsleil-Waututh's expectations and requirements with respect to consultation.

Comments were received from Tsleil-Waututh on the draft Consultation Plan on November 16, 2015 via letter/email. The Ministry responded to Tsleil-Waututh's comments, explaining how input had been considered and discussed any outstanding concerns or questions. Based on feedback received to date and discussions with Tsleil-Waututh on this matter, the Ministry is of the understanding that Tsleil-Waututh has no outstanding concerns or comments with respect to the Plan.

During initial discussions with Tsleil-Waututh, and as outlined in the Consultation Plan and Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Tsleil-Waututh.

In addition to meetings with Tsleil-Waututh representatives during the Initial Consultation Phase, Tsleil-Waututh participated in a site visit which focused on key Project components, mutual sharing of information, plans for tunnel decommissioning, plans for Deas Slough and Deas Island, and anticipated works and enhancements opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, Tsleil-Waututh's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and identification of potential impacts on Tsleil-Waututh's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

During the Initial Consultation Phase, the Ministry sought Tsleil-Waututh's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment
- Draft Heritage Resources Overview Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

Letters sent to Tseil-Waututh during this consultation Phase include:

- Introductory letter notifying Tseil-Waututh of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment Letter requesting review and comment on the draft Archaeological Overview Assessment (document also provided).

The Ministry met with Tsleil-Waututh and walked through the Project Description and Key Areas of Study and Draft Application Information Requirements documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input Tsleil-Waututh comments on draft EA documents shared during this Phase. Tsleil-Waututh provided comments on the Draft Heritage Resources Overview Assessment (Letter/email October 27, 2014). The Ministry also received feedback from TWN on the draft Application Information Requirements and Project Description and Key Areas of Study documents. Additional information on TWN's comments is provided in Aboriginal Consultation Report 2.

Between early 2014 and May 2016, the Ministry and the Tsleil-Waututh discussed and exchanged Project-related information through emails, phone calls, letters and meetings.

At meetings with Tsleil-Waututh during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Tsleil-Waututh's past, present and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Tsleil-Waututh's Aboriginal Interests. The Ministry also sought to determine Tsleil-Waututh's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

During this period, key topics and/or presentations covered during meetings with TWN include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

During the Initial Consultation Phase, Tsleil-Waututh submitted the following documents to the Ministry:

- Letter/email (October 27, 2014) Comments on the Draft Archaeological Overview Assessment
- Email (December 04, 2014) TWN Stewardship Policy
- Letter/email (2014-12-05) Comments on Draft Project Description and Proposed Studies
- Letter/email (November 16, 2015) comments on draft Aboriginal Consultation Plan

The Ministry provided Tsleil-Waututh with funding for the submission of a Project-related study and received the "Tsleil-Waututh Knowledge Study for the George Massey Tunnel Project" during the Initial Consultation Phase.

During the Pre-Application Phase, the Ministry met twice with Tsleil-Waututh and conducted two conference calls in relation to Tsleil-Waututh's input on the draft Application Information Requirements. Tsleil-Waututh attended two EAO-led Working Group meetings and engaged directly with EAO with respect to the EA process.

During this phase, Tsleil-Waututh Nation was consulted on the following Project-related documents:

- Draft project Description and Key Areas of Study document
- Draft Application Information Requirements;
- Components of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1

Tsleil-Waututh was also provided draft Consultation Report 2 for review and comment. Where appropriate, comments received on Report 2 have been incorporated into the revised document.

The following correspondence was shared via email and via mail/courier:

- Letter requesting review of Draft Part C content of the Application
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Documents/information shared by Tsleil-Waututh during this Phase include:

- Information related to suicide prevention concept (Email January 27, 2016)
- STIC Community Health Indicators (Email January 27, 2016)
- Smart Roadways Feasibility Study outlined (Email February 22, 2016)
- Comments on Draft Part C (Letter/email April 27, 2016)
- Comments on Aboriginal Consultation Plan #1 (Letter/email May 6, 2015)

Tsleil-Waututh provided comments on draft Aboriginal Consultation Report 1 and on draft Part C content. Revisions to these drafts were made based on input received from Tsleil-Waututh. Feedback on draft Consultation Report 1 is reflected in Consultation Report 2.

Consultation efforts to date sought to identify and address concerns and issues raised by Tsleil-Waututh raised by Tsleil-Waututh during the Initial Consultation and Pre-Application Phases (summarized in **Appendix 10-B Aboriginal Consultation Report 2**).

10.1.2.11 Planned Future Consultation

The Ministry will continue to work with Schedule B Aboriginal Groups during the Application Review Phase to further refine community-specific consultation activities and to coordinate the provision of Application Review Stage participation funding. Application Review Consultation activities for Schedule B Aboriginal Groups are described below. These activities are subject to

change and may be modified pending further planning with each Aboriginal Group. Proposed activities include:

- Notifying Aboriginal Groups of the submission of the Application.
- Providing copies of the Application to Aboriginal Groups (in preferred format).
- Conducting meetings with Chief and Council and/or staff to support their review of the Application (with participation of appropriate technical experts), address issues and concerns, refine mitigation measures, discuss Project-related benefits and opportunities (economic and non-economic), identify and plan follow up strategies, and ensure additional consultation and engagement requirements or commitments in relation to the Project's approval and construction are undertaken.
- Providing correspondence/communications related to, among other things, coordination of consultation activities, Project updates, resolution of concerns/issues, and identification of measures to avoid, mitigate or otherwise accommodate potential adverse effects on Aboriginal Interests.
- Delivering presentations to Chief and Council, or in the case of Tsawwassen First Nation, to Advisory Council, Executive Council or the Natural Resources Committee.
- Facilitating open houses or other special meetings (per request of Aboriginal Groups).
- Providing responses to Aboriginal Groups' comments and maintaining an issue/response tracking table that will be provided to EAO.
- Undertaking requirements as specified under the section 11 Order.

If an Environmental Assessment Certificate (EAC) is issued, then following the issuance of the EAC the Ministry will:

- Notify Schedule B Aboriginal Groups of the outcome of the Application Review, including requirements of the EAC and related commitments and assurances.
- Continue to consult with Schedule B Aboriginal Groups to fulfill obligations outlined in the EAC, including, but not limited to, review of construction-related plans and designs, and involvement in Project components of interest such as environmental enhancement and mitigation.
- Continue to ensure the fulfillment of commitments between the Ministry and specific Schedule B Aboriginal Groups.
- Actively explore, with Schedule B Aboriginal Groups, opportunities to provide economic and non-economic benefits to Aboriginal Groups that are directly affected by the Project. Opportunities include employment, training and contracting as well as environmental enhancement works and other components of the Project.
- Maintain ongoing communication and engagement with Schedule B Aboriginal Groups, including providing regular updates in relation to construction and Project milestones.

The Ministry will continue to document the following for future consultation phases:

- Consultation activities with Schedule B Aboriginal Groups.
- Opportunities provided to Schedule B Aboriginal Groups to identify Aboriginal Interests and concerns related to the Project.
- Information distributed to Schedule B and C Aboriginal Groups and consultation undertaken with Schedule B Aboriginal Groups.
- Issues and concerns raised during the Application Review and permitting stages, and the construction and operation phases and how these matters are to be addressed.

10.1.2.12 Key Issues and Concerns Raised by Aboriginal Groups

As noted in the individual summaries above, the Ministry received feedback from Schedule B Aboriginal Groups during the Project's Initial and Pre-Application Stage consultations. Consultation efforts to date sought to identify and address concerns and issues raised by Schedule B Aboriginal Groups. The concerns, issues and interests raised by Schedule B Aboriginal Groups during the Initial Consultation and Pre-Application Phases are included in the specific summaries for each Group.

10.1.2.13 Process for Resolving Outstanding Issues Raised by Aboriginal Groups

The Ministry acknowledges that some issues, concerns, or interests raised by Aboriginal Groups during the engagement and consultation process to date were not fully resolved prior to submission of the Application. During the Application Review stage the Ministry will give particular attention to addressing any concerns that remain outstanding through continued consultation with Aboriginal Groups as required (e.g., meetings with Chief and Council, information presentations, Working Group meetings).

After the issuance of the EAC, the Ministry will proceed with implementation of Project commitments and agreements with Aboriginal Groups where such agreements are undertaken. The Ministry will also work with regulatory authorities and Aboriginal Groups to obtain regulatory permits, and will monitor regulatory compliance throughout the Project's construction, operation, and tunnel decommissioning phases.

10.1.3 Aboriginal Interests Assessment

This section presents, for each Schedule B Aboriginal Group identified in **Section 10.1.1 Background Information**, the results of the assessment of potential adverse effects of the Project on the exercise of Aboriginal Interests, defined in the section 11 Order for the Project as asserted or determined Aboriginal rights, including title, or treaty rights. The results of the

assessment include the identification of potential Project-related interactions and effects and proposed mitigation measures, as well as whether residual effects are expected to persist following the implementation of mitigation.

10.1.3.1 Context and Boundaries

As indicated in **Section 10.1.1 Background Information**, Aboriginal Interests are known to overlap or lie in the vicinity of the Project corridor, which includes a portion of the South Arm of the Fraser River.

Aboriginal rights, including title, may be asserted by an Aboriginal group or determined through court proceedings.

As set out by the Supreme Court of Canada in *R. v. Van der Peet*, [1996] 2 S.C.R. 507, for an activity to be established as an Aboriginal right, it must be an element of a practice, custom, or tradition that is integral to the distinctive culture of the Aboriginal group claiming the right. This practice, custom, or tradition must also have continuity with the practices, customs and traditions that existed prior to European contact, the date of which varies across British Columbia. Examples of activities that have been found by the courts to ground Aboriginal rights in specific contexts include but are not limited to fishing, hunting, trapping, and gathering (e.g., *R. v. Sparrow*, [1990] 1 S.C.R. 1075, which confirmed Musqueam's right to fish for food, social, and ceremonial purposes in Canoe Pass and potentially in other areas, as referenced in **Section 10.1.1.7 Musqueam Indian Band**, and further discussed in **Section 10.1.3.2** below.

As set out by the Supreme Court of Canada in *Delgamuukw v. British Columbia*, [1997] 3 S.C.R. 1010, Aboriginal title is a specific form of Aboriginal right that pertains to the exclusive use and occupation of the land held pursuant to that title for a variety of purposes. These purposes need not be aspects of those Aboriginal practices, customs, or traditions that are integral to distinctive Aboriginal cultures; however, the land itself must have been of central significance to the distinctive culture of the Aboriginal group claiming title. To establish an Aboriginal title claim, the land in question must have been occupied by the Aboriginal group claiming title at the time the Crown asserted sovereignty over that land, which in British Columbia has been set by the courts at 1846. Occupation sufficient to ground Aboriginal title may apply to specific sites of settlement or to tracts of land that were regularly used for fishing, hunting, or otherwise utilizing resources, and over which the Aboriginal group was exercising effective control (i.e., exclusivity) at the time of the assertion of European sovereignty (*Tsilhqot'in Nation v. British Columbia*, 2014 SCC 44). To the Ministry's knowledge, there has been no declaration of Aboriginal title by a court with respect to lands in or near the Project area.

Treaty rights are established through formal agreements that have been negotiated between the Crown and Aboriginal groups. The only Treaty Nation named on Schedule B of the section 11 Order is the Tsawwassen First Nation. The Ministry is aware that the Project lies within and near areas subject to the Tsawwassen First Nation Final Agreement (TFN et al. 2009a,b), as referenced in **Section 10.1.1.10 Tsawwassen First Nation**, and further discussed in **Section 10.1.3.2** below.

The Crown is legally obligated to consult and, if necessary, accommodate adverse impacts to asserted or determined Aboriginal rights, including title, or treaty rights that may occur as a result of government decisions. Pursuant to the Supreme Court of Canada's decision in *Haida Nation v. British Columbia (Minister of Forests)*, 2004 SCC 73 (*Haida*), the extent or level of consultation owed by the Crown is proportionate to preliminary assessments of the following factors:

- Strength of the claim to the asserted Aboriginal right, including title, that may be adversely affected; and
- Seriousness of the potential adverse impact of the contemplated Crown action or activity to the Aboriginal Interest.

The extent or level of the Crown's obligation to consult is described in *Haida*, and in subsequent decisions regarding the duty to consult, as lying on a spectrum from notification to deep consultation. The section 11 Order for the Project identifies where on the spectrum the EAO has placed Aboriginal Groups at the outset of the environmental assessment (EA) process, as reflected in Schedule B and Schedule C of that Order. The Ministry, as the Proponent of the proposed Project, has been directed through the section 11 Order to identify potentially affected Aboriginal Interests, including all those raised by Aboriginal Groups, and to identify measures to avoid or mitigate the potential adverse effects and/or to otherwise address or accommodate the concerns of Aboriginal Groups, as appropriate. In an assessment report following the close of the Application Review period, the EAO will provide conclusions on the adequacy of measures proposed by the Ministry to avoid, reduce, or otherwise manage potential Project-related effects on the exercise of Aboriginal Interests based on the EAO's analysis of the strength of claim or, where applicable, determined rights of each Aboriginal Group and the predicted degree of Project-related effects on each Aboriginal Group's Aboriginal Interests. Where effects on determined rights (proven Aboriginal rights or treaty rights) are predicted, the EAO will undertake a justification analysis regarding potential infringement of the exercise of those determined rights. The EAO will also provide Aboriginal Groups with an opportunity to review the EAO's assessment report prior to finalization, and to make separate submissions to the Minister in addition to that assessment report.

Pursuant to Section 14.1 of the section 11 Order for the Project, the Ministry sought input from each Schedule B Aboriginal Group on the nature and scope of their Aboriginal Interests and how they might be impacted by the Project, including through Ministry-funded traditional use and knowledge studies specific to the Project (see **Section 10.1.2 Consultation Activities**). The analysis of potential Project-related impacts to the exercise of Aboriginal Interests in this section of the Application is grounded in relevant information that was provided by Schedule B Aboriginal Groups, or that was otherwise publicly available, regarding their past, present, and desired future uses of the Project area and surroundings for traditional purposes or pursuant to treaty, as summarized below for each Aboriginal Group in **Section 10.1.3.2**. “Traditional use” is used in this assessment to denote past, present, or future use activities that have been identified by Schedule B Aboriginal Groups as ancestral and passed down from generation to generation since before contact with Europeans, and includes cultural knowledge related to those activities. The information available to the Ministry on traditional use has been organized within **Section 10.1.3.2** according to activities that are either protected by treaty or have been previously found by courts to ground asserted Aboriginal rights and title (i.e., fishing, hunting/trapping, gathering), as well as related interests, such as language and culture (e.g., as represented by named places), cultural sites (e.g., habitation sites, sacred or spiritual areas, transportation routes), and cultural landscapes. For a description of the approach to integrating traditional knowledge into Part B assessments, refer to **Section 3.0 Assessment Methodology**.

The identification and analysis of potential adverse effects on traditional use activities and related interests as a result of Project construction or operation forms the basis of the Aboriginal Interests assessment. In evaluating these potential adverse effects, the findings of the following Valued Component (VC) chapters in Part B of the Application, including identified mitigation measures, residual effects, cumulative effects and follow up strategies, were considered based on the relevance of these VCs to the exercise of Aboriginal Interests:

- **Section 4.4 Fish and Fish Habitat**
- **Section 4.6 Marine Mammals**
- **Section 4.7 Vegetation**
- **Section 4.8 Terrestrial Wildlife**
- **Section 5.2 Marine Use**
- **Section 5.3 Land Use**
- **Section 5.5 Visual Quality**
- **Section 6.1 Heritage Resources**
- **Section 7.1 Human Health**

The findings of the following Intermediate Component (IC) chapters were also considered in relation to potential effect pathways on the exercise of Aboriginal Interests that may not involve pathways through VCs:

- **Section 4.1 River Hydraulics and River Morphology**
- **Section 4.2 Sediment and Water Quality**
- **Section 4.9 Air Quality**
- **Section 4.10 Atmospheric Noise**

The assessment of potential adverse effects of the Project on the exercise of Aboriginal Interests, including measures to address those effects, are presented below in **Section 10.1.3.3** through **Section 10.1.3.5**, and largely applies the same methods used in Part B of the Application for the IC and VC assessments, as outlined **Section 3.0 Assessment Methodology**.

In addition to information from the VC and IC assessments that support the assessment of potential effects on Aboriginal Interests, information from a Health Impact Assessment (HIA) undertaken to support Project planning, including mitigation recommendations, has been integrated into the assessment of potential effects on Aboriginal Interests. The HIA will be publicly available on the Project's website at www.masseytunnel.ca and a summary of the key findings is provided in Section 7.2 Health Impact Assessment.

Indicators

The indicator(s) chosen for the assessment of potential Project-related effects on the exercise of Aboriginal Interests and the rationale for their selection are presented in **Table 10.1-4**.

Table 10.1-4 Indicators for the Aboriginal Interests Assessment

| Indicator | Rationale for Selection |
|---|---|
| Access to preferred locations for the exercise of Aboriginal Interests | Project components or activities could result in changes in access to or patterns of travel between traditional use locations on land or water |
| Availability of preferred resources for the exercise of Aboriginal Interests | Project components or activities could result in changes in distribution or movement, relative abundance, or habitat area or composition of traditional use resources (as informed by IC or VC assessments pertaining to these resources) in traditional use areas (as informed by information provided by Aboriginal Groups or available in public sources specific to the exercise of their Aboriginal Interests) |
| Quality of preferred resources for the exercise of Aboriginal Interests | Project components or activities could result in changes in the real or perceived quality of traditional use resources (as informed by IC or VC assessments pertaining to these resources) in traditional use areas (as informed by information provided by Aboriginal Groups or available in public sources specific to the exercise of their Aboriginal Interests) |
| Quality of experience in exercising, or tied to the exercise of, Aboriginal Interests | Project components or activities could result in: (1) direct sensory disturbance to traditional users (e.g., from noise, vibration); and/or (2) indirect changes to cultural practices, customs or traditions – i.e., cultural heritage or the expression and transfer of cultural values or ways of knowing (e.g., language, laws/governance, stories, spiritual beliefs) – tied to the cultural landscape or to the traditional use of specific traditional use locations or resources within that landscape. |

Assessment Boundaries

Spatial Boundaries

Spatial boundaries for the assessment of potential Project-related effects on the exercise of Aboriginal Interests are defined in **Table 10.1-5**, followed by the rationale for their definition.

Table 10.1-5 Spatial Boundary Definitions for Aboriginal Interests

| Spatial Boundary | Description of Assessment Area |
|---------------------------------------|--|
| Local Assessment Area (LAA) | The LAA corresponds to each Schedule B Aboriginal Group’s traditional territory ⁵ or otherwise defined area(s) of traditional use (as provided by the Aboriginal Group to the Ministry). The assessment for the exercise of Aboriginal Interests that are related to ICs or VCs will focus on the exercise of Aboriginal Interests in areas that overlap the LAAs for those ICs and VCs; however, the territory or otherwise defined area(s) of traditional use remains the buffer for the assessment of potential Project effects on the exercise of Aboriginal Interests. |
| Regional Assessment Area (RAA) | Same as LAA. |

The LAA was established to encompass the area within which the Project may interact directly or indirectly with, and therefore potentially have an effect on, the exercise of Aboriginal Interests. In defining LAA boundaries for the Aboriginal Interests assessment, consideration was given to the specific nature and characteristics of Aboriginal Interests, which are understood to be exercised in relation to specific locations and resources based on traditional patterns of use, recognizing that these patterns have changed over time due to a number and range of factors. See **Figure 10-2** through **Figure 10-10** for boundaries of traditional territories or otherwise defined area(s) of traditional use that each serve as the LAA for the identified Schedule B Aboriginal Group. These figures were provided by the Ministry to Schedule B Aboriginal Groups for review and comment prior to the submission of the Application.

The RAA is the same as the LAA.

Temporal Boundaries

The temporal boundaries established for the assessment of potential Project effects on the exercise of Aboriginal Interests encompass the Project’s construction and operation phases, as described in **Section 1.1 Description of Proposed Project**. The Project construction phase (commencing 2017) includes, in addition to building of the new bridge and improvements at specific points along the Highway 99 corridor, decommissioning of the Tunnel and bridge over Deas Slough (after the commissioning of the new bridge). The Project operation phase (including maintenance) will be ongoing over the service life of the new bridge, which, once

⁵ References to “traditional territory” in this Application are to the asserted traditional territory of the Aboriginal Group, except where defined by treaty.

commissioned (2022), will be a permanent component of the regional and provincial transportation system, with no plans for decommissioning. Potential Project effects on the exercise of Aboriginal Interests during a decommissioning phase are therefore not considered in the assessment.

Temporal characteristics specific to Aboriginal Interests are considered in **Section 10.1.3.2 Existing Conditions** and **Section 10.1.3.3 Potential Effects**.

Administrative Boundaries

The assessment of Aboriginal Interests is constrained by the administrative limitations identified for the IC and VC assessments linked to the Aboriginal Interests assessment (see list of relevant IC and VC chapters above).

Technical Boundaries

The assessment of Aboriginal Interests is constrained by the technical limitations identified for the IC and VC assessments linked to the Aboriginal Interests assessment (see list of relevant IC and VC chapters above), as well as the data collection and reporting methodologies employed in existing information sources and Project-specific studies on traditional use and knowledge used to support the Aboriginal Interests assessment, as identified in the following section (Information Sources).

Information Sources

Information sources used to identify the exercise of Aboriginal Interests in relation to the proposed Project area, and assess potential adverse effects of the proposed Project on identified Aboriginal Interests, include:

- The description of the proposed Project and other Project-related information;
- Project-specific studies on traditional use and knowledge prepared by Schedule B Aboriginal Groups:
 - Cowichan Nation Alliance:
 - Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 2015
 - George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 2015

- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 2010

Hwlitsum, Hwlitsum First Nation Traditional Use and Occupation of the area now known as British Columbia, January 28, 2016

Katzie First Nation, George Massey Tunnel Replacement: Katzie First Nation Traditional Use Study, February 2016

Kwantlen First Nation, Kwantlen Land-Use and Occupation in the Vicinity of Highway 99, November 2015

Lake Cowichan First Nation, Ts'uubassatx Interests, November 2015

Lyackson First Nation, Preliminary Lyackson Use and Occupancy Mapping Study for BC MOTI's George Massey Tunnel Replacement Project, September 2015

Musqueam Indian Band, "Salmon so thick, that you could walk on water": Preliminary Scope of Musqueam Valued Components for the Environmental Impact Assessment of the Proposed George Massey Tunnel Replacement Project, November 2015

Tsawwassen First Nation, George Massey Tunnel Replacement: Project Impact Study, August 2015

Tsleil-Waututh Nation, Knowledge Study: George Massey Tunnel Project. February 2015

- Other traditional use and knowledge information provided by Schedule B Aboriginal Groups to the Ministry in the context of the Project (e.g., [Cowichan Land Use] Richmond, near No. 7 Rd., September 2014, submitted by Penelakut Tribe to the Ministry; A Cultural Impact Assessment of the Gateway Program, April 2007, submitted by Katzie First Nation to the Ministry)
- Publicly available and relevant traditional use and knowledge studies or ethno-historical or anthropological material pertaining to the area;
- Regulatory applications and reports, including submissions made by Schedule B Aboriginal Groups, for other nearby projects (e.g., Vancouver Airport Fuel Delivery Project, South Fraser Perimeter Road Project, and Roberts Bank Terminal 2 Project);
- Tsawwassen First Nation Final Agreement (TFNFA) and related documents;
- Relevant court decisions (e.g., *R. v. Sparrow*);
- Publicly available and relevant resource agreements between Schedule B Aboriginal Groups and government;
- Aboriginal communal licence information for Fisheries and Oceans (DFO) Pacific Fisheries Management Areas (PFMAs) overlapping the Project area;
- Schedule B Aboriginal Group websites;

- Records of consultation between the Ministry and Schedule B Aboriginal Groups in relation to the proposed Project; and
- Findings of relevant IC and VC chapters in Part B of the Application (as identified in the list above).

10.1.3.2 Existing Conditions

This section summarizes, for each Schedule B Aboriginal Group and based on the sources identified above in **Section 10.1.3.1** (Information Sources), relevant information on past, present, and desired future use of the proposed Project area and surroundings for traditional purposes that are or may be connected with the exercise of Aboriginal Interests.⁶

As indicated in **Section 10.1.3.1**, the information on traditional use within each Aboriginal Group's subsection has been organized according to activities that are either protected by treaty or have been previously found by courts to ground asserted Aboriginal rights and title (i.e., fishing, hunting/trapping, gathering), followed by a discussion of related interests, such as language and culture (e.g., as represented by named places), cultural sites (e.g., habitation sites, sacred and spiritual areas, transportation routes), and cultural landscapes. Traditional use is understood to be by definition ancestral, given that it is passed down from generation to generation since before contact with Europeans. Because of this characteristic, the precise time horizon of use (e.g., historical, within living memory, recent past, or still occurring) described in the following summaries of "existing" conditions may be difficult to discern. Further, some Aboriginal Groups have advised that where traditional use currently occurs (or is absent), such use may not be reflective of desired future use or where Aboriginal Interests exist or may be exercised in the future (including treaty rights). Aboriginal Groups have also indicated that an absence of use of certain locations or resources in the following descriptions of existing conditions does not necessarily reflect the absence of actual use by individual community members, which is often not known in any detail by Aboriginal Group representatives. For a detailed review of concerns raised by Aboriginal Groups in consultation with the Ministry regarding the proposed Project, see **Section 10.1.2 Consultation Activities**.

⁶ Any statements in this Application regarding traditional use are based on information provided by Aboriginal groups in the context of consultation on the Project, or as available in publicly available sources, and do not constitute admissions, acknowledgments or endorsements of the claims, positions, or accuracy of the information by the Province of British Columbia.

Cowichan Tribes

Key sources relied upon for this summary are the George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands (BKRC 2015); Historical Geography of Cowichan Land Use and Occupancy, Lower Fraser River: Map Series and Report (Brealey 2010); Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area (CT 2015); a map showing “Cowichan Land Use” in the Project area, provided by Penelakut Tribe (PT 2014); regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Cowichan Tribes. As part of that ongoing consultation, the Cowichan Tribes was provided with a draft of this summary and the information that appears in **Section 10.1.1.1** for review and comment. Comments were received from the Cowichan Nation Alliance, on behalf of the four member First Nations, and have been incorporated. In this summary, specific information on Cowichan Tribe’s traditional use has been supplemented with general information on traditional use by Cowichan Nation Alliance and Hul’qumi’num Treaty Group Nation Alliance member First Nations.

The Project area intersects with the claimed core territory or “title lands” of the member First Nations of the Hul’qumi’num Treaty Group, including *Tl’uq̓tinus* (**Appendix 10-A, Figure 10-2**), which lies along the Fraser River less than 4 km upstream from the north end of the George Massey Tunnel (BKRC 2015). *Tl’uq̓tinus* has been described as a “great summer village of the Cowichan-speaking people of Vancouver Island” (Suttles 2004), with “winter-village style houses” (Rozen 1985) surrounded by cultivated grounds (see **Plate 1** below). More recently, *Tl’uq̓tinus* has been described as a permanently occupied, multi-seasonal Cowichan Nation settlement (Brealey 2010), with a significant winter population and a summer population in the thousands (BKRC 2015). The lands over which *Tl’uq̓tinus* is said to have extended along the south shore of Lulu Island have been reported as “conservatively located on portions of Sections 21, 22, 23, 24, 26, 27, 28, 33, and 34 of Block 4 North, Range 5 West, as well as a waterfront portion of Block 4 North, Range 4 West” (Woodward and Company 2011).

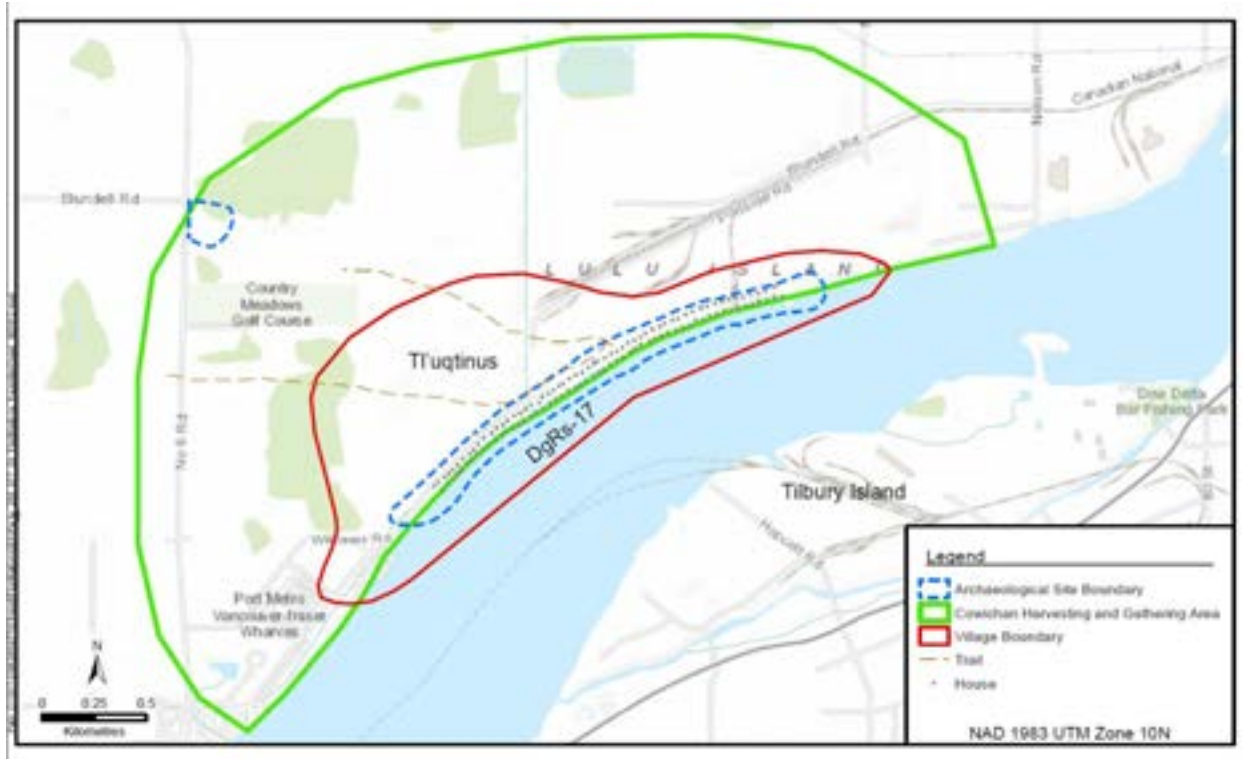

Plate 1. Lands of *Tl'uq̓tinus* Claim Area (CNA 2016a).⁷

The Cowichan Nation Alliance has stated that *Tl'uq̓tinus* was a home base occupied and used exclusively by the Cowichan Nation, the descendants of which are members of the First Nations represented by the Cowichan Nation Alliance (CT 2015), as well as other member bands affiliated with the Hul'qumi'num Treaty Group (BC and PMV 2012, CT 2015, Woodward and Company 2011). This shared or joint occupation and use reportedly extended from well before 1792 until after 1859 (Woodward and Company 2011), and constituted a base of operations for a shared land use regime that reached up the Fraser River at least as far as the fisheries at the Fraser Canyon (Brealey 2010). As indicated in **Section 10.1.1.1**, the Cowichan Nation Alliance is working to reestablish a permanent land base and river access at *Tl'uq̓tinus* for residential and/or commercial purposes (CNA 2016a,b).

⁷ This figure is a representation of information provided by the Cowichan Nation Alliance regarding *Tl'uq̓tinus* (2016a) in the context of consultation on the Project and does not constitute an admission, acknowledgment, or endorsement of that claim, position, or the accuracy of the information by the Ministry.

Fishing

Cowichan Tribes followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, CT 2015, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually. Within this round, the Fraser River estuary has been described as the “most important economically” (HTG 2005). Species harvested historically on the South Arm of the Fraser River included sockeye and pink salmon, sturgeon, shellfish, and marine mammals; dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul’q’umi’num’*-speaking groups were resident in and around the area (BC and PMV 2012, BKRC 2015). The Cowichan Nation Alliance has previously reported that now filled-in sloughs and streams in or near Highway 99 once supported coho and eulachon, which were also harvested while resident on the Fraser River (CNA 2011). Cowichan Tribes used *Tl’uq’tinus* seasonally for the foregoing purposes (TMPL 2014). (BC and PMV 2012, TMPL 2014).

Areas within the wider Fraser River estuary were also utilized by *Hul’q’umi’num’*-speaking peoples for fishing salmon, sturgeon, groundfish, and other marine resources on the foreshore (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HTG 2005). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round. Sockeye salmon and eulachon in particular could not be found in any river within Cowichan Nation’s territory on Vancouver Island (CT 2015).

The *Hul’q’umi’num* Treaty Group have reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul’q’umi’num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area (HTG 2005). The *Hul’q’umi’num* Treaty Group have also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul’q’umi’num Mustimuhw* say they continued to use the Fraser River for fishing, including commercially, into the early twentieth century (CT 2015, HTG 2005, TMPL 2014).

Member First Nations of the Cowichan Nation Alliance have been attempting to restore former fisheries within the Fraser River through Fisheries and Oceans Canada (DFO) (Cohen Commission 2011). Access to sockeye for member First Nations (including other members of the Hul'qumi'num Treaty Group) is said to be provided by DFO annually in Johnstone Strait and “off the mouth of the Fraser River” (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member First Nations of the Hul'qumi'num Treaty Group (i.e., Cowichan Tribes) fished for food, social, and ceremonial (FSC) purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that any of these groups, individually or collectively, has had access to fisheries in this area in the last eight years (DFO 2016). The Cowichan Nation Alliance has stated that it is in ongoing, active litigation over its asserted fishing rights on the South Arm of the Fraser River (CNA 2016a).

Hunting / Trapping

Cowichan Nation Alliance has previously reported that Highway 99 was built on what was once a prime harvesting location for deer, ducks, and geese, among other species (CNA 2011). Along the Fraser River, including Canoe Pass, as well as elsewhere in their collective territory, brant goose, canvasback duck, common merganser, and mallard have been specifically identified as harvested species by Cowichan Tribes, and that this harvesting would have taken place in the fall (BKRC 2015, TMPL 2014). Canada goose, northern shoveler, and green-winged teal would have been available to the Cowichan people year-round (BKRC 2015).

The south shore of Lulu Island, along the South Arm of the Fraser River, has been reported as a prime spot for trapping beaver, mink, and muskrat; bear, grouse, elk, squirrel, and porcupine were also hunted by the Cowichan people on the South Arm (BKRC 2015, CT 2015). Cowichan Tribes may also have hunted for mountain goat in the mountains of the lower Fraser River (BKRC 2015). The Cowichan Nation Alliance as a group has stated a desire to resume the harvest of traditional resources in the Project area (CNA 2011, CT 2015).

The Cowichan Nation Alliance has also stated that its members revere bald eagles, which were not hunted. Their Elders have indicated that eagle numbers in the Richmond area have been dwindling each year. Breeding habitat along the Highway 99 corridor on Lulu Island has been previously noted (CNA 2011).

Gathering

Member bands of the Cowichan Nation Alliance report that in the marshy areas south of Canoe Passage near Brunswick Point – in the area of *Xwulits'um*, or place for cutting (cattails) – as well as in the area of *Tl'uqtinus* and across the Fraser River on Tilbury Island, several varieties of cattails and rushes (*stth'equn*) were once harvested (PMV 2015, PT 2014). Berries and other plants were gathered and cultivated by the ancestors of the Cowichan Nation Alliance member bands at *Tl'uqtinus*, and were harvested from other locations in the Project area. These plants included wild rose, rose hips, crabapples, elderberries, horsetail, labrador tea, Indian hemp, trembling aspen, mock orange, oregon grape, maple leaves, cranberries, blueberries, blackberries, wapato, bulrushes/reeds (*stth'equn*), as well as seaweed (BC and PMV 2012, BKRC 2015, CT 2015, HTG 2005, PT 2014, TMPL 2014, Woodward and Company 2011). With respect to berry plants at *Tl'uqtinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979; Woodward and Company 2011).

The Cowichan Nation Alliance has indicated that they wish to see existing bogs on Lulu Island near the Highway 99 corridor – specifically, one near Williams Road (which runs perpendicular to Highway 99) and another near the Richmond Nature Park (bisected by Highway 99 at Westminster Highway) – protected to support future use of traditional resources, like berries and other bog ecosystem flora. At *Tl'uqtinus*, which is currently surrounded by blueberry farms, the Cowichan Nation Alliance have raised the potential for their former berry grounds to be re-established (Woodward and Company 2011).

Tree species available in the vicinity of the Fraser River and traditionally used by the Cowichan Tribes for manufacturing include crabapple, willow, alder, cottonwood, cedar, spruce, aspen, yew, hemlock, and vine maple (BKRC 2015).

Related Interests

The Cowichan Nation Alliance has stated that it asserts Aboriginal title to *Tl'uqtinus*, and given where *Tl'uqtinus* is reportedly situated, to the Project footprint. The Cowichan Nation Alliance has expressed its view that this title includes the right to manage the land, determine the uses to which it can be put, and obtain any economic benefits from it. The Cowichan Nation Alliance has advised that it is also working to reestablish culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm and at the mouth of the Fraser River, including at and about *Tl'uqtinus* (CNA 2016a).

The Cowichan Nation Alliance has previously reported that for the last generation its member First Nations have been rejuvenating their access to the waterways that once served as the highways for their ancestors, working with the currents and tides to travel for FSC purposes. The Cowichan Nation Alliance has expressed concern regarding the contaminants and the sustainability of vital habitats that are necessary to support their members (PMV 2015).

Halalt First Nation

Key sources relied upon for this summary are the George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands (BKRC 2015); Historical Geography of Cowichan Land Use and Occupancy, Lower Fraser River: Map Series and Report (Brealey 2010); Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area (CT 2015); a map showing “Cowichan Land Use” in the Project area, provided by Penelakut Tribe (PT 2014); regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Halalt First Nation. As part of that ongoing consultation, Halalt First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.1** for review and comment. Comments were received from the Cowichan Nation Alliance, on behalf of the four member First Nations, and have been incorporated. In this summary, specific information on Halalt’s traditional use has been supplemented with general information on traditional use by Cowichan Nation Alliance and Hul’qumi’num Treaty Group Nation Alliance member First Nations.

The Project area intersects with the claimed core territory or “title lands” of the member First Nations of the Hul’qumi’num Treaty Group, including *Tl’uqtinus* (**Appendix 10-A, Figure 10-2**), which lies along the Fraser River less than 4 km upstream from the north end of the George Massey Tunnel (BKRC 2015). *Tl’uqtinus* has been described as a “great summer village of the Cowichan-speaking people of Vancouver Island” (Suttles 2004), with “winter-village style houses” (Rozen 1985) surrounded by cultivated grounds (see **Plate 1** below). More recently, *Tl’uqtinus* has been described as a permanently occupied, multi-seasonal Cowichan Nation settlement (Brealey 2010), with a significant winter population and a summer population in the thousands (BKRC 2015). The lands over which *Tl’uqtinus* is said to have extended along the south shore of Lulu Island have been reported as “conservatively located on portions of Sections 21, 22, 23, 24, 26, 27, 28, 33, and 34 of Block 4 North, Range 5 West, as well as a waterfront portion of Block 4 North, Range 4 West” (Woodward and Company 2011).

Plate 1. Lands of *Tl'uq̓tinus* Claim Area (CNA 2016a).⁸

The Cowichan Nation Alliance has stated that *Tl'uq̓tinus* was a home base occupied and used exclusively by the Cowichan Nation, the descendants of which are members of the First Nations represented by the Cowichan Nation Alliance (CT 2015), as well as other member bands affiliated with the Hul'qumi'num Treaty Group (BC and PMV 2012, CT 2015, Woodward and Company 2011). This shared or joint occupation and use reportedly extended from well before 1792 until after 1859 (Woodward and Company 2011), and constituted a base of operations for a shared land use regime that reached up the Fraser River at least as far as the fisheries at the Fraser Canyon (Brealey 2010). As indicated in **Section 10.1.1.1**, the Cowichan Nation Alliance is working to reestablish a permanent land base and river access at *Tl'uq̓tinus* for residential and/or commercial purposes (CNA 2016a,b).

⁸ This figure is a representation of information provided by the Cowichan Nation Alliance regarding *Tl'uq̓tinus* (2016a) in the context of consultation on the Project and does not constitute an admission, acknowledgment, or endorsement of that claim, position, or the accuracy of the information by the Ministry.

Fishing

Halalt followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, CT 2015, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually. Within this round, the Fraser River estuary has been described as the “most important economically” (HTG 2005). Species harvested historically on the South Arm of the Fraser River included sockeye and pink salmon, sturgeon, shellfish, and marine mammals; dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul’q’umi’num*-speaking groups were resident in and around the area (BC and PMV 2012, BKRC 2015). The Cowichan Nation Alliance has previously reported that now filled-in sloughs and streams in or near Highway 99 once supported coho and eulachon, which were also harvested while resident on the Fraser River (CNA 2011). Halalt used *Tl’uq̓tinus* seasonally for the foregoing purposes; Halalt have reported that they used the area specifically in July to fish for sockeye and pink salmon, from Canoe Pass to as far up as Hope, with other member nations of the Cowichan Nation Alliance (TMPL 2014).

Areas within the wider Fraser River estuary were also utilized by *Hul’q’umi’num*-speaking peoples for fishing salmon, sturgeon, groundfish, and other marine resources on the foreshore (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HTG 2005). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round. Sockeye salmon and eulachon in particular could not be found in any river within Cowichan Nation’s territory on Vancouver Island (CT 2015).

The *Hul’q’umi’num* Treaty Group have reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul’q’umi’num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area (HTG 2005). The *Hul’q’umi’num* Treaty Group have also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul’q’umi’num Mustimuhw* say they continued to use the Fraser River for fishing, including commercially, into the early twentieth century (CT 2015, HTG 2005, TMPL 2014).

Member First Nations of the Cowichan Nation Alliance have been attempting to restore former fisheries within the Fraser River through Fisheries and Oceans Canada (DFO) (Cohen Commission 2011). Access to sockeye for member First Nations (including other members of the Hul'qumi'num Treaty Group) is said to be provided by DFO annually in Johnstone Strait and “off the mouth of the Fraser River” (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member First Nations of the Hul'qumi'num Treaty Group fished for food, social, and ceremonial (FSC) purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that any of these groups, individually or collectively, has had access to fisheries in this area in the last eight years (DFO 2016). The Cowichan Nation Alliance has stated that it is in ongoing, active litigation over its asserted fishing rights on the South Arm of the Fraser River (CNA 2016a).

Halalt participates in the Hul'qumi'num Fisheries Limited Partnership (HFLP), a commercial fishing business, with Penelakut Tribe and Stz'uminus First Nation. Species harvested through this enterprise are crab (one Area H licence), prawn (two local / coast wide licences), halibut (one licence and annual TAC quota), herring (13 gillnet and 1 seine), rockfish (two Area Inside licences, targeting yelloweye, quillback, copper, china, and tiger), sablefish (annual TAC quota), and salmon (five Area E gillnet licences) (HFLP 2014). Commercial fisheries for halibut and sablefish are generally undertaken off the west coast of Vancouver Island (PMV 2015, LFN 2016).

Hunting / Trapping

Cowichan Nation Alliance has previously reported that Highway 99 was built on what was once a prime harvesting location for deer, ducks, and geese, among other species (CNA 2011). Canada goose, northern shoveler, and green-winged teal would have been available to the Cowichan people year-round (BKRC 2015).

The south shore of Lulu Island, along the South Arm of the Fraser River, has been reported as a prime spot for trapping beaver, mink, and muskrat; bear, grouse, elk, squirrel, and porcupine were also hunted by the Cowichan people on the South Arm (BKRC 2015, CT 2015). The Cowichan Nation Alliance as a group has stated a desire to resume the harvest of traditional resources in the Project area (CNA 2011, CT 2015).

The Cowichan Nation Alliance has also stated that its members revere bald eagles, which were not hunted. Their Elders have indicated that eagle numbers in the Richmond area have been dwindling each year. Breeding habitat along the Highway 99 corridor on Lulu Island has been previously noted (CNA 2011).

Gathering

Member bands of the Cowichan Nation Alliance report that in the marshy areas south of Canoe Passage near Brunswick Point – in the area of *Xwulits'um*, or place for cutting (cattails) – as well as in the area of *Tl'uqtinus* and across the Fraser River on Tilbury Island, several varieties of cattails and rushes (*stth'equn*) were once harvested (PMV 2015, PT 2014). Berries and other plants were gathered and cultivated by the ancestors of the Cowichan Nation Alliance member bands at *Tl'uqtinus*, and were harvested from other locations in the Project area. These plants included wild rose, rose hips, crabapples, elderberries, horsetail, labrador tea, Indian hemp, trembling aspen, mock orange, oregon grape, maple leaves, cranberries, blueberries, blackberries, wapato, bulrushes/reeds (*stth'equn*), as well as seaweed (BC and PMV 2012, BKRC 2015, CT 2015, HTG 2005, PT 2014, TMPL 2014, Woodward and Company 2011). With respect to berry plants at *Tl'uqtinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979; Woodward and Company 2011).

The Cowichan Nation Alliance has indicated that they wish to see existing bogs on Lulu Island near the Highway 99 corridor – specifically, one near Williams Road (which runs perpendicular to Highway 99) and another near the Richmond Nature Park (bisected by Highway 99 at Westminster Highway) – protected to support future use of traditional resources, like berries and other bog ecosystem flora. At *Tl'uqtinus*, which is currently surrounded by blueberry farms, the Cowichan Nation Alliance have raised the potential for their former berry grounds to be re-established (Woodward and Company 2011).

Related Interests

The Cowichan Nation Alliance has stated that it asserts Aboriginal title to *Tl'uqtinus*, and given where *Tl'uqtinus* is reportedly situated, to the Project footprint. The Cowichan Nation Alliance has expressed its view that this title includes the right to manage the land, determine the uses to which it can be put, and obtain any economic benefits from it. The Cowichan Nation Alliance has advised that it is also working to reestablish culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm and at the mouth of the Fraser River, including at and about *Tl'uqtinus* (CNA 2016a).

The Cowichan Nation Alliance has previously reported that for the last generation its member First Nations have been rejuvenating their access to the waterways that once served as the highways for their ancestors, working with the currents and tides to travel for FSC purposes. The Cowichan Nation Alliance has expressed concern regarding the contaminants and the sustainability of vital habitats that are necessary to support their members (PMV 2015).

Katzie First Nation

Key sources relied upon for this summary include George Massey Tunnel Replacement: Katzie First Nation Traditional Use Study (Katzie First Nation 2016a), A Cultural Impact Assessment of the Gateway Program (Katzie First Nation 2007), regulatory documents for other projects in close proximity to the Project area (e.g., MOT 2006), and ongoing consultation between the Ministry and Katzie First Nation. As part of that ongoing consultation, Katzie First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.3** for review and comment. Katzie First Nation advised the Ministry that they required no changes.

Katzie First Nation has reported that their territory (**Appendix 10-A, Figure 10-4**) historically provided them ready access to freshwater and saltwater resources (i.e., five species of Pacific salmon, sturgeon, steelhead, trout, and eulachon), a wide variety of mammals and birds (e.g., elk, deer, mountain goat), and a plentiful supply of plant species, including but not limited to wapato (Katzie First Nation 2016a).

The ancestors of the Katzie First Nation are said to have once lived in at least ten villages throughout Katzie First Nation territory, eventually congregating at the village of *q'ə 'ye 'əy* (from which the anglicized “Katzie” derives), about 2 km downstream of Port Hammond (Katzie First Nation 2016a). This village, located 40 km from the mouth of the Fraser River, reportedly features heavily in Katzie oral history (Katzie First Nation 2016a). In addition to this village site (now Katzie 1), the only other Katzie village sites still permanently occupied are those at Barnston Island 3 and Katzie 2 (at the mouth of Yorkson Creek) in Langley (Katzie First Nation 2002, 2016a). The tributaries of Yorkson Creek are described as “within portage distance of the larger Nicomekl River,” which along with the Serpentine River, was a travel and trade corridor, connecting Katzie to Boundary Bay and the “salt-water people” who resided there (i.e., Semiahmoo), as well as downstream of Katzie on the Fraser River (i.e., Musqueam, Tsawwassen) (Katzie First Nation 2016a).

Katzie have stated that the Fraser River and other waterways within the Fraser River estuary, including the Nicomekl and Serpentine rivers, served as the focal point for harvesting fish, wildlife, and plant resources (Katzie First Nation 2007, 2016a, PMV 2012). They also served to strengthen important socio-economic (i.e., kinship and resource) ties between Katzie and

neighbouring groups on the outer coast, and Katzie have said that these ties remain a vital component of Katzie identity (Katzie First Nation 2016a). Katzie have also said, however, that twentieth-century dyking and dredging programs and agricultural development, widening some parts of the Fraser River and draining wetlands, have changed the waterways that facilitated these ties (Katzie First Nation 2016a).

Fishing

Katzie are said to have had access to freshwater clams from Pitt Lake, and marine invertebrate species have been found in archaeological deposits at Port Hammond (e.g., clams, mussels, cockles, whelks). Some reports suggest that marine resources would have been brought to Katzie by their relatives living on the outer coast, and that Katzie themselves did not harvest them directly; however, other reports suggest that Katzie may have obtained these resources while visiting their relatives, trading wapato and other goods in exchange for shellfish, or to trade for opportunities to harvest at certain shellfish beaches, such as Mud Bay, in the northeastern portion of Boundary Bay, at mouths of the Nicomekl and Serpentine rivers (Katzie First Nation 2016a).

The area between Barnston Island and the south bank of the Fraser River has been identified as an important fishing site for Katzie. Beginning in late April through to end of May, Katzie would gather at the village on the north bank of the Fraser River to harvest eulachon in Bishop's Reach, approximately 1 km downstream of the Golden Ears Bridge (BC and PMV 2012, Katzie First Nation 2016a). As the Fraser River began to flood during the spring rise, Katzie would then travel to their various sturgeon-fishing grounds on the Alouette River, Sturgeon Slough, Pitt Polder, Pitt River, and Pitt Lake. In August Katzie would return to the Fraser River for sockeye, leaving again in September in smaller groups to multiple locations to fish for dog salmon. Over the fall, fishing would continue, particularly for sturgeon, and picked up again in March, when families departed winter residences. At this time of year, sturgeon were reportedly abundant in the shallower sloughs of the territory, such as Sturgeon Slough, which Katzie say "was renowned as a famous sturgeon spawning ground" (Katzie First Nation 2016a).

Katzie First Nation has previously reported that, from the 1940s through the 1980s, many Katzie were involved in the commercial fishery, with some running their own boats (Katzie First Nation 2007). As recently as 2014, Katzie and other Lower Fraser First Nations, participated in an economic opportunity fishery for sockeye, of which Katzie are said to have had a share of 10,000 sockeye that could be sold (Melnychuk 2014). Sockeye, described as the Katzie's most valued resource, is referred to as an "elder brother," believed to take human form during the oceanic portion of their lifecycle, but returning as fish to swim upriver (Suttles 1955, Osborne 2010).

Currently, Katzie are among the numerous First Nations involved in the Lower Fraser River salmon fishery under food, social and ceremonial (FSC) licences issued by Fisheries and Oceans Canada (DFO). Of the 570 registered members of Katzie First Nation, roughly one third of those members is reportedly licenced to fish during openings on the Fraser River, and an estimated 120 Katzie vessels use the Fraser River to harvest fish annually, with 50 to 70 Katzie vessels on the water at once during the largest openings (Melnychuk 2014, MOT 2006).

Katzie are typically licenced to fish for FSC purposes in the stretch of Fraser River between the Port Mann Bridge to the Mission portion of the Lower Fraser, using both drift and set nets; however, DFO records from 2004 onward indicate that Katzie are also often licenced to fish within a smaller subsection of this area – that is, Port Mann Bridge to Kanaka Creek/Derby Reach. Katzie have previously reported that their fishing area, which is in the vicinity of their communities, is renowned as one of the best, most productive areas to fish in the lower Fraser River between Hope and the estuary (MOT 2016). Since 2004, Katzie appear to have been licenced to fish in this area for Chinook, sockeye, and chum salmon, steelhead, and eulachon, as well as for chum salmon specifically in the Pitt River, although the targeted species, timing, and frequency have varied year over year. Katzie has also accessed Fraser River FSC fisheries as part of the Lower Fraser River First Nations (DFO 2016).

In 2015, Katzie had opportunities to harvest salmon from the Fraser River under communal license, accessing Chinook on three 12-hour occasions (September 5, 6, and 7), between Port Mann Bridge and Mission. Katzie also had three limited participation (i.e., ceremonial) licences in 2015, accessing Chinook on September 3 (for 12 hours) and chum on November 8 and 15 (for eight hours each day), between Port Mann Bridge and Kanaka Creek/Derby Reach. Also harvested in 2015 under limited participation licences was eulachon on two occasions, April 4 and 8 (for 6 hours each day), also between Port Mann Bridge and Kanaka Creek/Derby Reach. In 2015, other fishing opportunities for Katzie would have been provided through licences to the Lower Fraser River First Nations (DFO 2016).

Hunting /Trapping

Deer, elk, mountain goat, and black bear, some smaller fur-bearing animals (e.g., beaver, marten, mink, raccoon), seals have been identified by Katzie as hunted in the past, with game targeted in the early to mid-summer months, then again in October through winter (Katzie First Nation 2016a). Katzie also harvested waterfowl, which they say was plentiful on the shores of Pitt River and Pitt Lake, particularly on the marshy flats east of Pitt River and around Silver (Widgeon) Creek (Katzie First Nation 2016a, Suttles 1955).

Katzie have identified hunting as second only to fishing in importance to their subsistence and ceremonial lives (Katzie First Nation 2007); however, Katzie have also said that they now have limited areas over which they can still hunt and discharge firearms given land development in their territory. For example, Katzie have said that while they still harvest waterfowl on Barnston Island, they currently hunt only on the north and east aspects of the island, having voluntarily stopped the practice on the south side to limit public concerns (MOT 2006).

Gathering

Summer harvest of roots and berries were important for the provision of nutritional and cultural sustenance for Katzie (Usborne 2010), though harvesting of plants was not restricted to the summer months, often also occurring in fall (Katzie First Nation 2016a). Seasonally flooded lands in Katzie territory provided them with an abundance of bogs and marsh plants; two of the most important were the cranberry, which became ripe in September, and wapato, an aquatic, potato-like root plant that grows in shallow sloughs and ponds (Katzie First Nation 2007). Cranberry harvesting areas included the mouth of the Alouette River, around Sturgeon Slough, and at Widgeon Creek; some cranberry bogs were said to be shared by all Katzie while others belonged exclusively to particular families (Katzie First Nation 2016a, Suttles 1955). Wapato was reportedly harvested in October and November on the flats north of Sturgeon Slough and around Siwash Island on the west bank of Pitt River (Suttles 1955). The wapato patches in Katzie territory have been described as “famous among First Nations,” where once a number of other groups would have visited Katzie in the fall to gather them (Katzie First Nation 2016a). Other plants identified as traditionally harvested by Katzie include, but are not limited to, bog blueberries, strawberries, salmonberries, blackberries, blackcaps, thimbleberries, red and blue huckleberries, Saskatoons, salal-berries, the fruit of the crab-apple, oso plum, and black haw (Suttles 1955). Katzie have reported that they also gathered cedar bark for use in manufacturing clothes and other household items (Katzie First Nation 2016a).

Related Interests

Katzie have said that their identity and territory are inseparable, and have described that relationship in the following way (Katzie First Nation 2016a):

To travel through the territory that Katzie call home is to encounter a landscape imbued with meaning. It is this landscape that anchors and informs a distinct Katzie identity, but also ties Katzie to a wider community of kin who share common ancestry and similar relationships to cultural landscapes informed by their own distinctive sense of place.

Katzie have also described this landscape to which they are attached as sacred, and the role of harvesting resources within this territory as an important means of strengthening family relations and transmitting knowledge and values to new generations. Katzie have remarked that, as access to their territory declines, each opportunity to continue practicing traditional activities becomes even more significant (Katzie First Nation 2007). Katzie have previously said that this practice of traditional use, including use and activity areas, spiritual and ceremonial sites, named locations, and cultural landmarks, are all considered to be, in addition to archaeological sites, part of Katzie cultural heritage (MOT 2006).

Kwantlen First Nation

Key sources relied upon for this summary include, but are not limited to, *Kwantlen Land-Use and Occupation in the Vicinity of Highway 99* (Kwantlen First Nation 2015), regulatory documents for other projects in close proximity to the Project area (i.e., MOT 2007), and ongoing consultation between the Ministry and Kwantlen First Nation. As part of that ongoing consultation, the Kwantlen First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.4** for review and comment. Comments were received from the Kwantlen First Nation and have been incorporated.

As indicated in **Section 10.1.1.4**, Kwantlen First Nation has recently provided a map of their territory that indicates that its southwestern extent takes in Deas Island and all of Lulu Island, as well as portions of the Project area south of the Fraser River (Kwantlen First Nation 2015). Kwantlen reports that the westward reach of their territory extends, on the North Arm of the Fraser River, to a small creek above Marpole (*kəxənmit* and other variations), and on the South Arm of the Fraser River, “to a small slough (Deas Slough) a few hundred yards above Ladner.” Kwantlen also reports that these descriptions of Kwantlen territory are reflected in ethnographic sources. They further say that documents pertaining to the arrival of Simon Fraser in Kwantlen territory in 1808 demonstrate Kwantlen control of these areas, as well as further upstream, where they were occupying, at that time, a village in present day New Westminster and a summer camp and fishing station at *q’əq’yət*, across the Fraser River from New Westminster, at Brownsville (Surrey) (Kwantlen First Nation 2015). Later in the nineteenth century, Kwantlen had a reserve set aside for them at *q’əq’yət*, adjacent to a now former Musqueam reserve (Crockford 2010), but Kwantlen have said that, by then, they had moved from their primary village at New Westminster to Fort Langley, where they still reside (Kwantlen First Nation 2015).

Fishing

Kwantlen First Nation consider the vitality of the Fraser River and its resources to be an important element of Kwantlen culture (Kwantlen First Nation 2015). Kwantlen Elders have explained how X_á:ls (their Creator) located the Kwantlen people at the shores of the Fraser River so they could have access to the region's rich resources. Salmon was and remains a primary resource to them and the basis of their economy (MOT 2007), and are held sacred as a bequest from X_á:ls. Kwantlen's traditional seasonal rounds were determined by salmon runs, when they joined other First Nations on tributaries and lakes to fish and preserve it for winter (Kwantlen First Nation n.d.).

Currently, Kwantlen are among the numerous First Nations involved in the Lower Fraser River salmon fishery under food, social and ceremonial (FSC) licences issued by Fisheries and Oceans Canada (DFO). Kwantlen are typically licenced to fish for FSC purposes in the stretch of the Fraser River between the Port Mann Bridge and Mission, using both drift and set nets (DFO 2016); however, DFO records from 2004 onward indicate that Kwantlen are also often licenced to fish within smaller subsections of this area – that is, Port Mann Bridge to Kanaka Creek/Derby Reach or Kanaka Creek/Derby Reach to Mission. Since 2004, Kwantlen appear to have been licenced to fish in this area for Chinook, sockeye, and chum salmon and eulachon, although the timing and frequency have varied year over year. Kwantlen has also accessed Fraser River FSC fisheries in this area as part of the Lower Fraser River First Nations (DFO 2016).

In 2015, Kwantlen had opportunities to harvest salmon from the Fraser River under FSC communal licences, limited participation (i.e., ceremonial) licences, and economic opportunity licences. Communal licences appear to have been issued only for Chinook salmon, over three days in September, while limited participation licences were issued for Chinook and chum salmon for a portion of one day each, in April and November, respectively, and eulachon on four occasions in April. While Kwantlen would have also accessed Fraser River fisheries as part of the Lower Fraser River First Nations in 2015 (e.g., for chum under economic opportunity licences), for comparison, in 2004, Kwantlen fished under communal licence for Chinook from March until July, sockeye in July and August, and chum over October and November (DFO 2016). Kwantlen have previously noted and expressed concern about diminishing fish stocks (Murray 2014).

Kwantlen has reported that they used the upper intertidal area of Mud Bay, at the northeastern aspect of Boundary Bay, for shellfish harvesting (Kwantlen First Nation 2015). This area was reportedly accessed by transportation routes from the Fraser River, as discussed further below (see “Related Interests”).

Hunting / Trapping

Kwantlen reportedly hunted deer, elk, mountain goats and other small game (e.g., ducks, geese, and grouse), and trapped beaver and martin. Stave River, a tributary of the Fraser River, is said to have been important to Kwantlen for hunting and trapping and as a training area for youth (Kwantlen First Nation n.d.).

Gathering

Kwantlen have identified a former berry/plant gathering area at a bog located in the eastern and northern portion of Lulu Island, along the south bank of the North Arm of the Fraser River. Cranberries are specifically identified (Kwantlen First Nation 2015).

Related Interests

Kwantlen have reported that they understand their cultural heritage sites to include “any geographically-defined site (on land or water) used for the purposes of settlement, occupation, cultural use, resource gathering, transportation, or similar activity,” and note that while these sites “may lack the physical evidence of human-made artifacts or structures,” they are still of cultural significance. Kwantlen say that some of the “most highly significant” cultural heritage sites are associated with fishing on the Fraser River (Kwantlen First Nation 2015).

In addition to locations identified above primarily in relation to fishing and other resource harvesting, Kwantlen have identified several traditional transportation routes to the east of the project corridor, including, but not limited to: a trail from the head of Mud Bay to the South Arm of the Fraser and to *Kikait* (*q’əq’yət*), across from New Westminster; a trail/canoe route leading from the Fraser River at the west end of Barnston Island to the Serpentine River, leading to Mud Bay; a trail/canoe route from the Fraser River along the Salmon River then overland to the Serpentine River, leading to Mud Bay; the Nicomekl River itself (*neq’əmeqəl* and other variations); a trail/canoe/portage route from the mouth of the Salmon River at the Fraser River to its source, then by portage to the upper forks of the Nicomekl River, and downriver to the mouth of the Nicomekl River (i.e., Black Spit or *stətaq*); and a trail leading from the headwaters of the Nicomekl River southward across Langley Prairie to Campbell River, then following this river to its mouth at Semiahmoo Bay (Kwantlen First Nation 2015).

Lake Cowichan First Nation

Key sources relied upon for this summary are *Ts'uubaasatx Interests: George Massey Tunnel* (Chuuchkamalthnii 2015), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Lake Cowichan First Nation. As part of that ongoing consultation, Lake Cowichan First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.5** for review and comment. Comments had not been received by the time of Application submission.

The Project area intersects with the claimed core territory or “title lands” of the member bands of the Hul'qumi'num Treaty Group (**Appendix 10-A, Figure 10-2**), with which the Lake Cowichan has been affiliated. This area includes *Tl'uqtinus*, in the vicinity of the north end of the George Massey Tunnel. It has been previously reported that each of the six Hul'qumi'num Treaty Group member nations had “a share of the title interest” at *Tl'uqtinus*, meaning that each group owned permanent houses and the land their respective houses were situated on. These houses and “house lands” were not shared between *Hul'qumi'num'*-speaking groups. All other nations would have been considered “guests,” and would have to have sought the express permission of the heads of the *Hul'qumi'num' Mustimuhw* households to stay at the village. Harvesting areas or stations were also recognized as property of households, or specific families or individuals within those households (BC and PMV 2012, VAFFC 2011).

A Lake Cowichan First Nation community member recently stated that they have not used any resources from the George Massey Tunnel area since 1960, but that they do occasionally access the area (Chuuchkamalthnii 2015).

Fishing

Hul'qumi'num Mustimuhw, which includes the Lake Cowichan, followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually. Within this round, the Fraser River estuary has been described as the “most important economically” (HTG 2005).

Species harvested historically on the South Arm of the Fraser River included salmon, sturgeon, eulachon, shellfish, and marine mammals (particularly seals); dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul'q'umi'num'*-speaking groups were resident in and around the area (BC and PMV 2012). According to an 1827 Hudson's Bay Company journal, the "Saumni" (i.e., Somenos, ancestors of the Lake Cowichan) were among those residing on the South Arm of the Fraser River "around the present site of the George Massey Tunnel," and specifically at its north end, at *Tl'uq'tinus* (Rozen 1985).

Areas within the wider Fraser River estuary were also utilized by *Hul'q'umi'num'*-speaking peoples for fishing salmon, sturgeon, groundfish, and other marine resources on the foreshore (e.g., Roberts Bank, Tsawwassen, Point Roberts, Boundary Bay) (Chuuchkamalthnii 2015, HTG 2005). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round.

As a collective, the *Hul'q'umi'num* Treaty Group has reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul'q'umi'num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area. The *Hul'q'umi'num* Treaty Group has also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul'q'umi'num Mustimuhw* continued to use the Fraser River for fishing into the early twentieth century (HTG 2005).

Access to sockeye for *Hul'q'umi'num* Treaty Group member nations for food, social, and ceremonial (FSC) purposes is said to be provided annually by Fisheries and Oceans Canada (DFO) in Johnstone Strait and "off the mouth of the Fraser River" (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member nations of the *Hul'q'umi'num* Treaty Group (i.e., Cowichan Tribes, Penelakut Tribe) fished for FSC purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO management areas to which Lake Cowichan FSC licences apply are not specified in their latest available fisheries agreement with DFO; however, Lake Cowichan's agreement mentions sockeye, which does not occur in the Cowichan River system (LCFN and DFO 2013). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that Lake Cowichan has had recent access to fisheries in this area (DFO 2016). Lake Cowichan have reported, however, that one of their

FSC fishers has obtained fish at the mouth of the Fraser River and Roberts Bank area in two of the last three years. Two species of salmon have been targeted at Roberts Bank – sockeye and spring (Chinook) -- with approximately 20 to 50 of each species harvested annually (spring through fall) (PMV 2015).

Lake Cowichan First Nation currently participates in the Hul'qumi'num Fisheries Limited Partnership (HFLP), a commercial fishing business, along with Cowichan Nation Alliance member groups and Lyackson First Nation. Species harvested under commercial licences through this enterprise are crab (one Area H licence), prawn (two local / coast wide licences), halibut (one licence and annual TAC quota), herring (13 gillnet and 1 seine), rockfish (two Area Inside licences, targeting yelloweye, quillback, copper, china, and tiger), sablefish (annual TAC quota), and salmon (five Area E gillnet licences) (HFLP 2014). Commercial fisheries for halibut and sablefish are generally undertaken off the west coast of Vancouver Island (PMV 2015, LFN 2016).

Hunting / Trapping

Descriptions of past, present, and desired future hunting and trapping activities in the Project area specifically by the Lake Cowichan First Nation were not identified in information reviewed to date; however, it is assumed that these activities would have resembled what has been reported for other *Hul'qumi'num' Mustimuhw* while resident on the Fraser River. Large game likely included deer and black bear; small game, fur-bearing mammals, and waterfowl from aquatic settings along sloughs and wetlands, such as beaver, muskrat, otters, mink, ducks, geese, and swans, would also have been targeted (VAFFC 2011).

Lake Cowichan have reported they are harvesting seals (Chuuchkamalthnii 2015) and ducks, specifically mallards and coots (mud hens), at Roberts Bank. They have previously expressed concern regarding the diminishing numbers of marine birds in the area (PMV 2015).

Gathering

Lake Cowichan First Nation has reported gathering eelgrass at Roberts Bank in the intertidal zone (PMV 2015). Other gathering activities of the Lake Cowichan First Nation specifically in the vicinity of the Project area were not available in sources reviewed, but have been inferred from descriptions pertaining to the Hul'qumi'num Treaty Group as a whole. Other member bands of the Hul'qumi'num Treaty Group have reported that berries and other plants were gathered and cultivated by *Hul'qumi'num' Mustimuhw* ancestors at *Tl'uqtinus*, and were harvested from other locations in the Project area. These plants included cranberries, blueberries, blackberries, wapato, and bulrushes/reeds (*stth'equn*) (HTG 2005, Woodward and Company 2011). With

respect to berry plants at *Tl'uq̓tinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979, Woodward and Company 2011).

Related Interests

Members of the Lake Cowichan First Nation community are actively working to find members that have dispersed from the community, and they have expressed their desire to, at some time in the future, visit the Project area with these new members in order to renew their relationship with and learn about their “traditional rights” in the area (Chuuchkamalthnii 2015).

Lyackson First Nation

Key sources relied upon for this summary are *Preliminary Lyackson Use and Occupancy Mapping Study (LUOMS) for BC MoTI's George Massey Tunnel Replacement Project* (LFN 2015), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Lyackson First Nation. As part of that ongoing consultation, the Lyackson First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.6** for review and comment. Comments were received from the Lyackson First Nation and have been incorporated, where possible. Lyackson First Nation requested that additional sources be reviewed by the Ministry and cited in the following summary regarding their past, present, and desired future use (LFN 2016); however, the specific information from those sources that Lyackson First Nation wished to have included in the summary had not been identified by Lyackson First Nation to the Ministry by the time of Application submission.

Lyackson First Nation has described *Le'eyqsun* (Valdes Island) as their homeland and ancestral territory (LFN 2015, PMV 2015). *Le'eyqsun* lies approximately 45 km to the west of the Project area; however, the Project area intersects with the claimed core territory or “title lands” of the member bands of the Hul'qumi'num Treaty Group (**Appendix 10-A, Figure 10-2**), with which Lyackson First Nation has been affiliated. This area includes *Tl'uq̓tinus*, in the vicinity of the north end of the George Massey Tunnel, opposite Tilbury Island. The Lyackson First Nation reportedly had a house at *Tl'uq̓tinus* along with each of the other Hul'qumi'num Treaty Group member bands (BC and PMV 2012, LFN 2015, PMV 2015). Lyackson Elders and knowledge holders have described *Tl'uq̓tinus* as having been like a “little New York,” and a powerful and permanent *Hul'qumi'num Mustimuhw* trading centre for a number of commodities (BC and PMV 2012).

Fishing

Hul'qumi'num Mustimuhw, which includes the Lyackson First Nation (LFN 2014), followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually.. Lyackson members have reported that having a base at the mouth and South Arm of the Fraser River, where they could prepare and preserve food before crossing the Strait of Georgia, was an important part of their subsistence system (LFN 2015).

The Fraser River, from its mouth up to Seabird Island (east of Chilliwack), has been described as a key fish and shellfish harvesting area for Lyackson, with Canoe Passage (*Hwlhitsu'm*) identified as particularly important for salmon fishing. Lyackson Elders recall crossing the Strait of Georgia to the mouth of the Fraser River to participate in commercial fishing, primarily for sockeye. Salmon and other fish were said to be abundant and easily fished in large numbers from small vessels. Dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul'qumi'num*-speaking groups were resident in and around the area (BC and PMV 2012, LFN 2015).

Areas within the wider Fraser River estuary were also utilized by *Hul'qumi'num*-speaking peoples for fishing salmon, sturgeon, groundfish, halibut, and other marine resources on the foreshore (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HTG 2005, LFN 2015). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round. The same has also been reported by Lyackson in regard to marine mammals (i.e., seals, porpoise, sea otters, sea lions, and whales) (LFN 2015, PMV 2015).

As a collective, the *Hul'qumi'num* Treaty Group has reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul'qumi'num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area. The *Hul'qumi'num* Treaty Group has also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul'qumi'num Mustimuhw* continued to use the Fraser River for fishing into the early twentieth century (HTG 2005).

Access to sockeye for Hul'qumi'num Treaty Group member bands for food, social, and ceremonial (FSC) purposes is said to be provided annually by Fisheries and Oceans Canada (DFO) in Johnstone Strait and "off the mouth of the Fraser River" (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member nations of the Hul'qumi'num Treaty Group (i.e., Cowichan Tribes, Penelakut Tribe) fished for FSC purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO management areas to which Lyackson FSC licences apply are not specified in their latest available fisheries agreement with DFO; however, Lyackson's agreement suggests that their current fishing focus is on traditional areas in and around *Le'eyqsun*, surrounding Gulf Islands, and locations on Vancouver Island (e.g., Chemainus River, Bonsall Creek) (LFN and DFO 2013). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that Lyackson has had recent access to fisheries in this area (DFO 2016). Lyackson Elders confirm that, at one time, family ties and arrangements between communities provided consistent access to salmon at the mouth of the Fraser River, but that, today, other First Nations attempt to require Lyackson to seek permission prior to harvesting in the area (PMV 2015).

Lyackson First Nation has said that the mouth and South Arm of the Fraser River is currently the source of over 50% of their current subsistence salmon catch (LFN 2015); however, they have also said that low present-day fish populations require larger boats and more expensive technology to obtain fish in sufficient numbers to meet their subsistence and commercial needs. For these and other reasons, they say fishing in the Fraser River area has become largely unavailable to them (PMV 2015). Specifically, Lyackson have reported that it costs \$10,000 for them to make each trip, and that they would fish in the Fraser River if that is where the fish were, but they can no longer afford to make that trip and they do not catch fish there when they drop their nets (LFN 2016).

The Hul'qumi'num Fisheries Limited Partnership (HFLP) is a commercial fishing business in which the Lyackson First Nation currently participates. Species harvested through this enterprise are crab (one Area H licence), prawn (two local / coast wide licences), halibut (one licence and annual TAC quota), herring (13 gillnet and 1 seine), rockfish (two Area Inside licences, targeting yelloweye, quillback, copper, china, and tiger), sablefish (annual TAC quota), and salmon (five Area E gillnet licences) (HFLP 2014). Commercial fisheries for halibut and sablefish are generally undertaken off the west coast of Vancouver Island. Lyackson First Nation also hold, independently of the HFLP, a commercial licence for red sea urchin (PMV 2015) and a 1/16th block of geoduck, purchased in the last quarter of 2015 (LFN 2016).

Hunting / Trapping

Lyackson report that, in the past, they hunted for ducks and geese in the Project area, while deer were hunted farther up the Fraser River (LFN 2015). Lyackson report currently harvesting ducks, deer, and grouse at Porlier Pass, which they say remains a particularly important marine and terrestrial resource harvesting area for Lyackson given the range of resources that occur there (PMV 2015).

Gathering

Lyackson First Nation has said that members recall harvesting berries (including salmonberries and huckleberries), cattails, and fiddleheads in the Project area (LFN 2015). With respect to berry plants at *Tl'uqtinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979, Woodward and Company 2011). Berry-picking sites are said to be currently available to Lyackson at Porlier Pass (PMV 2015).

Related Interests

Lyackson First Nation has identified a number of culturally important places, including *S'utl'qulus* (or *s7etl'keles*), meaning “facing outside,” for the east side of *Le'eyqsun*, and *Kw'ukw'iyukwun*, a fishing area off the southeastern end of *Le'eyqsun*, in the Strait of Georgia. A newly constructed youth camp, where the canoes of their ancestors once lined up in preparation for trips to Fraser River, is also located on the eastern side of *Le'eyqsun* (PMV 2015).

Musqueam Indian Band

Among sources relied upon for this summary are *Salmon so thick, that you could walk on water: Preliminary Scope of Musqueam (xʷməθkʷəyəm) Valued Components for the Environmental Impact Assessment of the Proposed George Massey Tunnel Replacement Project* (MIB 2015) and *Musqueam Comprehensive Land Claim: Preliminary Report on Musqueam Land Use and Occupancy* (MBC 1984), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Musqueam Indian Band. Musqueam Indian Band was provided with a draft of this summary and the information that appears in **Section 10.1.1.7** for review and comment. Comments received from Musqueam have been incorporated, where possible. The Ministry is committed to working with Musqueam with respect to concerns raised regarding this summary.

The Musqueam Indian Band has described areas within its traditional territory (**Appendix 10-A, Figure 10-6**) over which extended families exercised exclusive use and occupation (MBC 1984):

Certain resource sites of a restricted or concentrated nature, such as waterfowl and deer netting stations, fish trap locations, certain berry patches, or fields of edible roots were ‘corporately’ owned by extended families. These were used to the exclusion of other families, although their use might be shared with permission. Unlike things considered private property [e.g., moveable goods, such as tools, fishing equipment, canoes, house-boards, matting, utensils, and foods], these places and resource sites could not be alienated from the extended family group. ... [These areas] were recognized as ‘property’ over which Musqueam exercised exclusive rights.

It is not known whether the Musqueam Indian Band asserts that any of these areas are specifically within or near the Project footprint; however, it is known that the Musqueam Indian Band asserts title to its traditional territory generally (MIB 1976), and has recently asserted title to *Zuq̓tinus* or *λ’əqətines* (BC and PMV 2012, MIB 2011, VAFFC 2011). Rozen (1985) reports that this location was likely a summer camp of the Musqueam originally, used later by other groups with the permission of the Musqueam and “other Mainland Halkomelem.”

Fishing

The Musqueam Indian Band have an established right to fish for food, social, and ceremonial (FSC) purposes in the area of Canoe Pass on the South Arm of the Fraser River (SCC 1990; also described in the SCC’s decision as “the waters of Ladner Reach and Canoe Passage”). The Musqueam also assert an Aboriginal right to fish for FSC purposes in a broader area that includes but is not limited to all waters of the Fraser River – including its North Arm, Middle Arm, and South Arm – downstream of the Port Mann Bridge to the Strait of Georgia (BC and PMV 2012, PMV 2015). The Project area lies immediately upstream of the area in which the Musqueam’s right to fish for FSC purposes has been established, and within the area where this right is considered by the Ministry to be asserted.

All five species of Pacific salmon, steelhead, rockfish (rock cod, red snapper), herring and herring spawn, smelt, halibut, eulachon, trout, and sturgeon were fished historically by the Musqueam in their traditional territory (see previous section), and all were important economically. The most commonly harvested marine mammals included harbour seal, sea lion, and porpoise; harvesting areas included the Fraser River estuary. At productive beaches within Musqueam traditional territory, abalone, barnacles, clams, chitons, cockles, mussels, crabs, crayfish, octopus, oysters, prawn, scallops, sea urchins, sea cucumber, shrimp, and seaweed were harvested and set aside for winter supplies; however, clams were the most abundant and heavily harvested, including at Boundary Bay (MBC 1984; MIB 2015; PMV 2015).

Fishing remains central to the Musqueam, and they have specified that the waters outside Steveston, Canoe Passage, and the lower of the Fraser River, and Roberts Bank are their most intensive salmon harvesting areas (PMV 2015). Salmon is a key species to the Musqueam, important for FSC and economic purposes, forming a basis for trade with other First Nations (PMV 2015).

In the mid-1980s, species harvested included all five species of Pacific salmon, all varieties of cod fish, steelhead, sturgeon, flounder, halibut, crayfish, herring, octopus, seals, prawn, shrimp, mussels, sea urchins, abalone, scallops, cockles, barnacles, chiton, sea cucumbers, and seaweed. Other species harvested within Musqueam traditional territory or obtained beyond that territory through self-harvesting, trade, or barter included clams, oysters, herring roe, smelts, and eulachon (MBC 1984; MIB 2015). Lingcod, midshipmen, sculpin (specifically buffalo, red Irish lord, and staghorn), rock sole, limpets, and dog whelks have also been identified as species traditionally used by Musqueam (MIB 2015).

In 2013 salmon allocations for FSC purposes, pursuant to agreement between DFO and Musqueam (DFO and MIB 2013), were 1,200 pieces of Chinook, 75,000 pieces of sockeye, 17,325 pieces of pink, 16,500 pieces of chum, and incidental harvest of hatchery-marked coho. Conservation concerns, also shared by Musqueam, have resulted in restrictions on the targeted fishing of coho, access to Chinook, and retention of steelhead (PMV 2015).

While Musqueam once harvested salmon daily and throughout the year, Fisheries and Oceans Canada (DFO) records for the last few years indicate that fishing opportunities no longer occur with such frequency (DFO 2016).

In 2013 Musqueam had opportunities to harvest salmon under communal licence, as follows:

- Chinook salmon on 14 occasions, between 8 and 18 hours each, May 18 through September 1;
- Sockeye salmon during 2 openings, one each in July and August, for 24 and 36 hours, respectively;
- Pink salmon over 4 openings in September, between 19 and 24 hours; and,
- Chum salmon on 3 occasions in October, lasting between 36 and 48 hours each.

There were 15 additional, limited participation fisheries (i.e., ceremonial purposes) in 2013:

- Chinook salmon on 8 occasions over May, July, August and September (6 to 12 hours each);
- Sockeye salmon on 2 occasions, one each in July and August (24 and 32 hours, respectively);
- Pink salmon on 2 occasions, in September (12 hours each); and,
- Chum salmon on 3 occasions, in October (between 6 and 12 hours).

In late September and late October 2013, Musqueam also participated in economic opportunity fisheries, which draw from the annual FSC allocation, and allow for the sale of pink and chum salmon harvested during specific opening times.

In 2014, Musqueam were issued communal licences to harvest salmon as follows:

- Chinook salmon on 11 occasions, between 5 and 36 hours each, May 18 through July 20;
- Sockeye salmon on 6 occasions, between 4 and 36 hours each, July 26 through August 23; and
- Chum salmon on 3 occasions, between 24 and 48 hours each, October 5 through October 19.

There were no communal licences issued for pink salmon in 2014. There were an additional eight limited participation fisheries in 2014:

- Chinook salmon on 2 occasions, in June and July (12 and 15 hours respectively); and
- Sockeye salmon on 6 occasions, in late July and August (4 to 56 hours each).

Musqueam also participated in economic opportunity fisheries in 2014:

- Sockeye salmon on 18 occasions, in August and September (4 to 16 hours each); and
- Chum salmon on 2 occasions, in October (10 hours each).

In 2015, Musqueam were issued communal licences to harvest salmon as follows:

- Chinook salmon on 21 occasions, May 2 through September 6 (between 12 and 24 hours each);
- Sockeye salmon on 3 occasions August 1 through August 9 (between 12 and 16 hours each);
- Chum salmon on 1 occasion, October 10 through October 12 (48 hours); and
- Pink salmon on 6 occasions September 12 through September 30 (6 to 12 hours each).

There were an additional five limited participation fisheries in 2015:

- Chinook salmon on 3 occasions, in July and August (7 to 8 hours each); and
- Sockeye salmon on 2 occasions, in August (12 hours each).

Musqueam also participated in economic participation fisheries in 2015, with two opportunities to harvest pink salmon on September 14 and 15 (6 and 4 hours respectively), and two opportunities to harvest chum salmon on October 22 and 25 (5 and 12 hours respectively) (DFO 2016).

Retained catch for the period 2009 to 2015, including limited participation and economic fisheries, is presented in **Table 10.1-6**. Musqueam report that they are not able to catch enough salmon to meet their communal needs (PMV 2015).

Table 10.1-6 Musqueam Salmon Catch (Kept), 2009 to 2015

| Species | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|---------|--------|---------|---------|--------|--------|---------|--------|
| Chinook | 5,889 | 2,988 | 3,643 | 2,546 | 1,500 | 2,169 | 2,834 |
| Sockeye | 3,673 | 231,847 | 84,097 | 41,403 | 20,528 | 193,199 | 16,115 |
| Pink | 39,102 | 0 | 105,012 | 0 | 65,278 | 0 | 843 |
| Coho | 198 | 87 | 690 | 261 | 713 | 242 | 147 |
| Chum | 13,082 | 8,158 | 15,315 | 14,849 | 24,145 | 20,249 | 25,158 |

Source: (DFO 2016)

Areas in which Musqueam fishing for salmon for FSC purposes is permitted include all or portions of Fisheries and Oceans Canada (DFO) management subareas 29-3, 29-4, 29-6, 29-7, 29-9, 29-10, 29-11, 29-12, 29-13, 29-14, and 29-17 (DFO and MIB 2013). Musqueam fishing for other species for FSC purposes is also largely limited to these areas, described collectively as follows:

Those waters of the Fraser River westerly of the power lines immediately downstream of the Port Mann Bridge and the waters of the Strait of Georgia bounded by a line commencing at Point Grey thence northerly to the light on Point Atkinson, thence westerly to the light on Point Cowan on Bowen Island, thence following the southerly shoreline of Bowen Island to the light on Cape Roger Curtis, thence in a direct line southeasterly to the Roberts Bank LL# 309 (known as the Hooter Buoy) thence due west to the 40 metre contour line as shown on C.II.S. 3463, thence follow the 40 metre contour line to the International border.

Subareas 29-13 and 29-14 overlap the Project area; however, there are areas outside of Area 29, most notably in Area 28, over which Musqueam traditional territory also extends (e.g., Indian Arm, Burrard Inlet, and waters off Point Grey), but within which Musqueam fishing for FSC purposes is not permitted.

Starry flounder are harvested in the South Arm of the Fraser River, outside Canoe Passage, and from Steveston through Roberts Bank. Currently, Musqueam are not licenced to retain flounder as a by-catch, but have requested a licence through DFO. Musqueam report that halibut, once fished within their traditional territory, in both shallow and deep waters, can no longer be easily found (PMV 2015).

Certain species, such as sturgeon and steelhead, are not harvested in Musqueam traditional territory because of conservation concerns. Musqueam maintain they would not have survived without sturgeon, which range throughout the South Arm of the Fraser River, concentrating around Canoe Passage and adjacent areas when eulachon enter the channel. The sloughs in which Musqueam once caught sturgeon have been largely filled in. However, Musqueam have observed an increasing number of sturgeon as by-catch, potentially indicating a recovery of the species and the potential for Musqueam to resume sturgeon harvesting for FSC purposes, within conservation limits (PMV 2015).

Musqueam report that historically they travelled up the Fraser River as far as New Westminster and Mission to harvest eulachon. A decade ago, harvesting eulachon was pursued under open licences. Currently in the lower Fraser River, eulachon can be fished by drift net in limited amounts for ceremonial purposes, but only on a case-by-case basis. There were three, 5 to 6 hour openings for Musqueam in 2013 (April 13, 16, 17); seven, 6 hour openings in 2014 (April 11, 12, 13, 15, 16, 18, 19); and six, 6 hour openings in 2015 (April 10, 11, 13, 14, 15, 16) (DFO 2016). Eulachon harvesting occurs in Canoe Passage, Ladner Reach, and waters around Duck, Rose, Kirkland, Gunn, and Barber Islands (PMV 2015).

Herring, once a staple fishery, was harvested throughout the Fraser estuary, as well as Howe Sound, Burrard Inlet, and False Creek. Herring are still harvested in Canoe Passage and on the north shore of the South Arm of the Fraser River. Herring roe, once gathered within Musqueam asserted territory, is now traded for because of conservation and contamination concerns. Once contamination and conservation concerns are addressed, Musqueam desire to return to harvesting roe. They continue to target rockfish (there are no DFO restrictions in place). Musqueam have also expressed a desire to resume harvesting ratfish (used medicinally) and dogfish (PMV 2015).

In 2013, 2014, and 2015, Musqueam were licenced to harvest crab (targeting Dungeness, graceful and red rock) within the Musqueam Crab Area and prawn in PFMA sub-areas 29-2, 29-3, and 29-4 throughout the year (DFO 2016). Musqueam have expressed a desire to obtain DFO licences, allowing them to use FSC allocations of crab, as well as other species, for economic or commercial purposes, as they would have undertaken traditionally (PMV 2015).

Musqueam report concerns regarding the decreasing areas in which crab can be harvested within Musqueam asserted territory as well as the compromised quality of crab in areas that remain accessible. For example, they state crab in Burrard Inlet (within their asserted territory) should no longer be consumed and identify the lack of tidal flows and increasing sedimentation, created by the terminals and causeways at Roberts Bank as contributing factors to less productive crab habitat conditions (PMV 2015).

Octopus, a traditional food source, is caught a by-catch to Musqueam fishers but cannot be retained without a licence. Musqueam are seeking to obtain a licence to address the ongoing community need and demand for the resource (PMV 2015).

Sea urchin and sea cucumber once harvested for food and medicine, are no longer harvested due to contamination concerns. Musqueam explain clams and cockles once gathered around Tsawwassen are no longer believed to be safe for consume. They must now trade for these resources with their relatives from other Aboriginal groups, or buy the seafood for from stores for their Elders. They express a desire to harvest these resources again and express concern that forced changes in diet, for example as a result of food avoidance, may be a contributing factor to the overall health of community members (PMV 2015). PFMA 28 and 29 are subject to a permanent biotoxin (as well as more localized sanitary) closures, prohibiting the harvest of all bivalve shellfish for consumption.

The most commonly harvested marine mammals were the harbor seal, sea lion, and porpoise. Seal harvesting occurred throughout the Fraser River Estuary, including all areas of the South Arm of the Fraser River and offshore of Steveston, Westham Island, and Brunswick Point. Musqueam report also harvesting seal outside of Steveston (PMV 2015).

The meat of seal and sea lion meat is valued as a food source, and the whiskers have important ceremonial functions. Seal skins have been used in drum-making and seal fat was once rendered for oil. Although seals and sea lions may be harvested by Aboriginal peoples under a special DFO licence, Musqueam report that the meat of the animal is high in pollutants, and although resumption of harvesting is desired, it is dependent on contamination and conservation concerns being lessened (PMV 2015).

The Musqueam Indian Band is involved in commercial fisheries through Salish Seas Limited Partnership, a business owned jointly with the Tsleil-Waututh Nation and Sliammon First Nation. Species harvested commercially through this enterprise include crab, prawn, halibut, and herring. Individual Musqueam members also hold commercial licences (PMV 2015).

Hunting / Trapping

Deer, wapiti (elk), bear, and mountain goat were once harvested in several areas of Musqueam traditional territory (MBC 1984). Musqueam report that deer and bear have been taken at Burns Bog within living memory; deer have also been harvested at areas along the South Arm of the Fraser River (i.e., the south shore between Tilbury and Annacis Islands). Harvesting of game (e.g., deer, mountain goat) continues to take place in the more northerly parts of Musqueam asserted territory (PMV 2015).

Small land mammals were abundant throughout Musqueam asserted territory and trapping of these animals was once common. Mink, muskrat, and otter were used mainly for furs; beaver and rabbit were harvested for both food and furs (MBC 1984).

Grouse were hunted in the open fields of Lulu Island, and pheasant were taken in meadows throughout the Fraser River delta (MBC 1984). In the area of the Project, waterfowl was harvested at the western extent of Lulu Island, Westham Island, Canoe Passage, and Musqueam IR 4 (about 0.5 km south of the middle reach of Canoe Passage and 2 km east of Brunswick Point). The most common species taken included, but were not limited to, mallard, widgeon, pintail, teal, murrelets, grebes, loons, scoters, scaups, and harlequins. Food sources also included migratory species of Canada goose, snow goose, and swans, and the eggs of ducks and gulls (MBC 1984).

More recently, hunting within Musqueam traditional territory has been focused primarily on wildfowl, including mallard, teal, widgeon, pintail, black duck (scoters, including white-wing, surf, and American varieties, preferred for their size and fat content), geese (including brant), grouse, and pheasant, and has taken place on the river banks, marshes, and meadows throughout the Fraser delta, including but not limited to the foreshore areas adjacent to the Musqueam Indian Band reserve on Canoe Pass and those adjacent to Tsawwassen Lands (MBC 1984). Musqueam identify mergansers as having specific cultural importance, while brant geese are reportedly not as abundant as they once were (PMV 2015).

Musqueam report that swans, herons, cranes, and raptors (e.g., eagles, osprey) were formerly harvested for food and ceremonial use, but are not currently due to conservation concerns. These birds and their parts, which are derived from birds collected by conservation officers, remain vital to the Musqueam and continue to be used for ceremonial purposes (PMV 2015).

Additional species identified as having been traditionally harvested by Musqueam include wolves, martens, skunks, raccoons, wood and goldeneye ducks, oldsquaws, buffleheads, cormorants, and seagulls (MIB 2015).

Gathering

Common plant foods consumed domestically were wapato, camas lily, huckleberry, blueberry, salmonberry, elderberry, bog cranberry, *slehal* (salal) berries, and Pacific crabapple. Of these, berries were particularly central; important berry grounds were owned by certain families, and, dried berries served with fish or seal oil formed a fundamental part of the winter diet. Bog cranberries were also a commodity, exchanged with other nations; these were harvested, for example, on Lulu Island, on the islands in the South Arm of the Fraser River, and at Burns Bog (MBC 1984).

Berry gathering and exchange remains important for food and ceremonial purposes. Ladner and Richmond have been identified as areas within which harvesting (i.e., of thimbleberry, salmonberry, salal berry, soapberry and huckleberry) still occurs; however, the most heavily harvested areas are around the main reserve community, as well as at Musqueam Park and within the University Endowment Lands at Point Grey. This also applies to floral resources used for medicinal and curative purposes. Harvested species include cascara bark, Labrador tea, alder, elderberry root, Oregon grape, cherry bark, devil's club, juniper, balsam, foxglove, nettle, ferns (a variety of roots), burdock, hemlock, rosehip, chokecherry, horsetail, skunk cabbage, vine maple, regular maple, wild crabapple, clover, dandelion, silverweed, mountain ash, chamomile, blackberry leaves, and strawberry, blueberry, and cranberry plants (MBC 1984). Additional species traditionally used by Musqueam include pacific cinquefoil, pink spirea (hardhack), canary grass, Indian consumption plant (bare-stem desert parsley), red ochre, feathers, fowl eggs, sedge, wild rye, bunchgrass, ocean spray, thimbleberries, black hawthorn berries, and blackcaps (black raspberries). Additional tree species include Douglas fir, Sitka spruce, white birch, cottonwood, willows, grand fir, shore pine, yew, dogwood, broadleaf maple, and wax/snowberry (MIB 2015).

Musqueam identify Brunswick Point as an important area for harvesting aquatic and terrestrial plants for food, medicinal, ceremonial, and manufacturing purposes. Intertidal species harvested include cattail, tule (hard-stemmed bulrush), and grasses (conceivably canary grass, used for weavings, basketry, and tumplines). Other key harvesting areas for these plants include Westham Island, Canoe Passage, Musqueam IR 4, and Ladner. Musqueam report that although they continue to harvest many of these resources, some are no longer accessible in former locations due in part to changing intertidal landscapes and barriers associated with commercial and industrial development (PMV 2015).

Cattail and tule are used ceremonially, for weavings and mats; the bulbs and roots of cattail are edible. Musqueam report cattails are also indicators of environmental health; if the plant is aromatic when first cut the environment is healthy and foul-smelling when the environment is compromised. These plants are also used as wind indicators when hunting. The practice of cutting cattails to let salmon through is the basis for the place-name *šx^whíc'əm*, on the south shore of Canoe Passage, near Brunswick Point (PMV 2015).

Horsetail, wild rose, and thistle were harvested at Brunswick Point, as well as Musqueam IR 4 for medicinal, curative, or ceremonial purposes. Musqueam also harvest broad-leaf plantain (medicinal plant) and stinging nettle (multi-purpose plant, including net-making). The latter is reportedly scarce as is Indian consumption plant, which Musqueam obtain through trade or harvest around Tsawwassen First Nation Lands (PMV 2015).

Musqueam report that kelp, once harvested throughout Roberts Band and Sturgeon Bank, remains an important food and medicinal plant. Now it is traded either because it cannot be found or is avoided due to contamination concerns. The same issues are noted for seaweeds generally. Musqueam attribute the loss of healthy kelp and eelgrass, which serve as an important habitat for crab and other marine life, to the effects of industrial activity in the region and habitat alteration (PMV 2015).

Plants were and remain used as ingredients and materials for dyes, basketry, cordage, and manufacturing. To the Musqueam, the single most important plant species was cedar. Cedar remains important for cultural purposes, as do other woods, tree products, feathers, shells, bulrushes, and other non-food resources (e.g., mountain goat wool), which are still gathered, both within and, where necessary, beyond Musqueam traditional territory (MBC 1984).

Related Interests

Musqueam report that, historically, they could navigate from the North Arm of the Fraser River through what is currently known as Richmond (Lulu Island) and Delta, using slough channels as an alternate to ocean travel. These sloughs, which once supported fishing locations, no longer survive. They maintain that the remaining waterways have become reportedly congested with log booms and increasing vessel traffic, resulting in more vessel interactions, loss of fishing gear, and safety concerns (PMV 2015).

Musqueam identify several trails within the Fraser River estuary, including trails associated with the following place names: *λ'eqtines* (Lulu Island, across from Deas Island; *sc'əl'əx^wqən'* (Ladner); and, *spəlxən* (two trails on the eastern margins of Crescent Slough, at the western aspect of Burns Bog). They also reference a trail running north-south along the western shore of Lulu Island, to and from the Steveston area (*q^weya?x^w*, *q^wleyəm*) (PMV 2015).

Penelakut Tribe

Key sources relied upon for this summary are the George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands (BKRC 2015); Historical Geography of Cowichan Land Use and Occupancy, Lower Fraser River: Map Series and Report (Brealey 2010); Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area (CT 2015); a map showing “Cowichan Land Use” in the Project area, provided by Penelakut Tribe (PT 2014); regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Penelakut Tribe. As part of that ongoing consultation, Penelakut Tribe was provided with a draft of this summary and the information that appears in **Section 10.1.1.1** for review and comment. Comments were received from the Cowichan Nation Alliance, on behalf of the four member First Nations, and have been incorporated. In this summary, specific information on Penelakut’s traditional use has been supplemented with general information on traditional use by Cowichan Nation Alliance and Hul’qumi’num Treaty Group Nation Alliance member First Nations.

The Project area intersects with the claimed core territory or “title lands” of the member First Nations of the Hul’qumi’num Treaty Group, including *Tl’uq̓tinus* (**Appendix 10-A, Figure 10-2**), which lies along the Fraser River less than 4 km upstream from the north end of the George Massey Tunnel (BKRC 2015). *Tl’uq̓tinus* has been described as a “great summer village of the Cowichan-speaking people of Vancouver Island” (Suttles 2004), with “winter-village style houses” (Rozen 1985) surrounded by cultivated grounds (see **Plate 1** below). More recently, *Tl’uq̓tinus* has been described as a permanently occupied, multi-seasonal Cowichan Nation settlement (Brealey 2010), with a significant winter population and a summer population in the thousands (BKRC 2015). The lands over which *Tl’uq̓tinus* is said to have extended along the south shore of Lulu Island have been reported as “conservatively located on portions of Sections 21, 22, 23, 24, 26, 27, 28, 33, and 34 of Block 4 North, Range 5 West, as well as a waterfront portion of Block 4 North, Range 4 West” (Woodward and Company 2011).

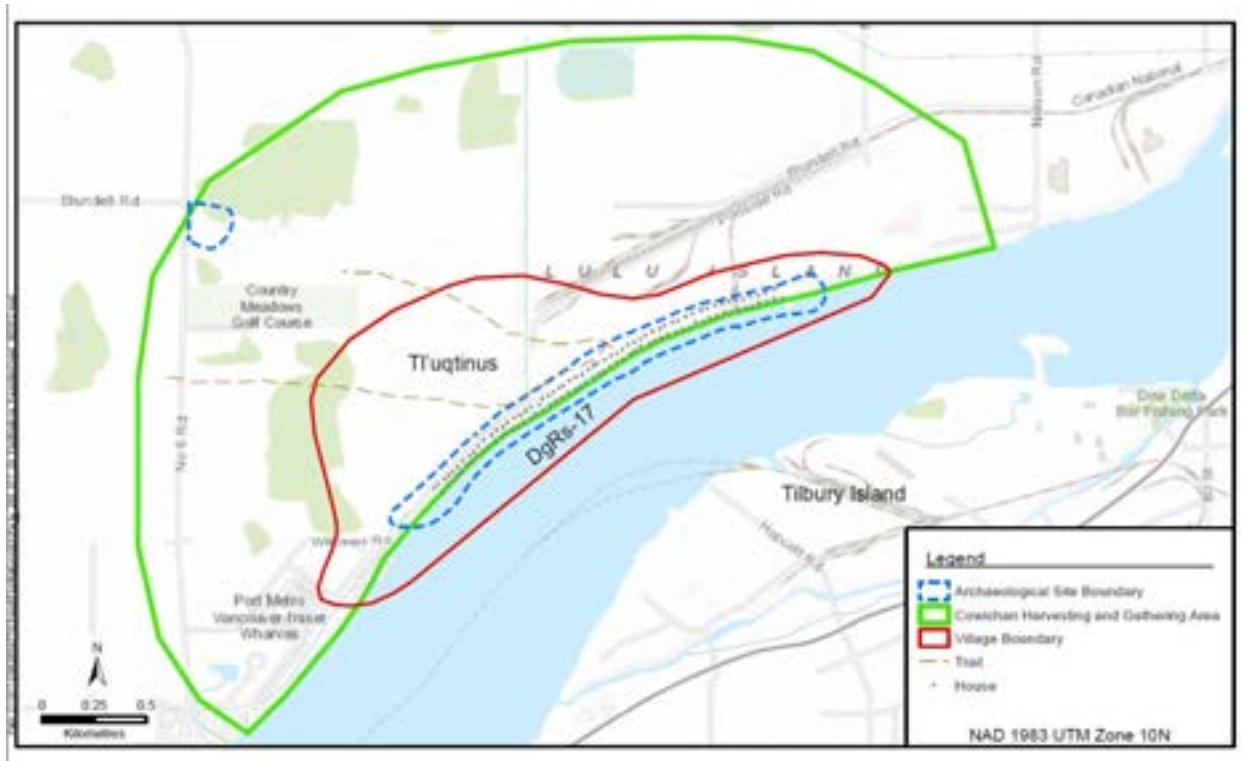

Plate 1. Lands of *Tl'uq̓tinus* Claim Area (CNA 2016a).⁹

The Cowichan Nation Alliance has stated that *Tl'uq̓tinus* was a home base occupied and used exclusively by the Cowichan Nation, the descendants of which are members of the First Nations represented by the Cowichan Nation Alliance (CT 2015), as well as other member bands affiliated with the Hul'qumi'num Treaty Group (BC and PMV 2012, CT 2015, Woodward and Company 2011). This shared or joint occupation and use reportedly extended from well before 1792 until after 1859 (Woodward and Company 2011), and constituted a base of operations for a shared land use regime that reached up the Fraser River at least as far as the fisheries at the Fraser Canyon (Brealey 2010). As indicated in **Section 10.1.1.1**, the Cowichan Nation Alliance is working to reestablish a permanent land base and river access at *Tl'uq̓tinus* for residential and/or commercial purposes (CNA 2016a,b).

⁹ This figure is a representation of information provided by the Cowichan Nation Alliance regarding *Tl'uq̓tinus* (2016a) in the context of consultation on the Project and does not constitute an admission, acknowledgment, or endorsement of that claim, position, or the accuracy of the information by the Ministry.

Fishing

Penelakut followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, CT 2015, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually. Within this round, the Fraser River estuary has been described as the “most important economically” (HTG 2005). Species harvested historically on the South Arm of the Fraser River included sockeye and pink salmon, sturgeon, shellfish, and marine mammals; dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul’q’umi’num*-speaking groups were resident in and around the area (BC and PMV 2012, BKRC 2015). The Cowichan Nation Alliance has previously reported that now filled-in sloughs and streams in or near Highway 99 once supported coho and eulachon, which were also harvested while resident on the Fraser River (CNA 2011). Penelakut used *Tl’uq̓tinus* seasonally for the foregoing purposes (TMPL 2014). Penelakut also used other habitation sites in the area, including ones along a slough at the southern extent of No. 4 Road, and on a little bay just below Brunswick Point, on the south side of the western entrance to Canoe Pass (BC and PMV 2012, TMPL 2014).

Areas within the wider Fraser River estuary were also utilized by *Hul’q’umi’num*-speaking peoples for fishing salmon, sturgeon, groundfish, and other marine resources on the foreshore (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HTG 2005). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round. Sockeye salmon and eulachon in particular could not be found in any river within Cowichan Nation’s territory on Vancouver Island (CT 2015).

The *Hul’q’umi’num* Treaty Group have reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul’q’umi’num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area (HTG 2005). The *Hul’q’umi’num* Treaty Group have also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul’q’umi’num Mustimuhw* say they continued to use the Fraser River for fishing, including commercially, into the early twentieth century (CT 2015, HTG 2005, TMPL 2014).

Member First Nations of the Cowichan Nation Alliance have been attempting to restore former fisheries within the Fraser River through Fisheries and Oceans Canada (DFO) (Cohen Commission 2011). Access to sockeye for member First Nations (including other members of the Hul'qumi'num Treaty Group) is said to be provided by DFO annually in Johnstone Strait and "off the mouth of the Fraser River" (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member First Nations of the Hul'qumi'num Treaty Group (i.e., Cowichan Tribes, Penelakut Tribe) fished for food, social, and ceremonial (FSC) purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that any of these groups, individually or collectively, has had access to fisheries in this area in the last eight years (DFO 2016). The Cowichan Nation Alliance has stated that it is in ongoing, active litigation over its asserted fishing rights on the South Arm of the Fraser River (CNA 2016a).

Penelakut participates in the Hul'qumi'num Fisheries Limited Partnership (HFLP), a commercial fishing business, with Halalt First Nation and Stz'uminus First Nation. Species harvested through this enterprise are crab (one Area H licence), prawn (two local / coast wide licences), halibut (one licence and annual TAC quota), herring (13 gillnet and 1 seine), rockfish (two Area Inside licences, targeting yelloweye, quillback, copper, china, and tiger), sablefish (annual TAC quota), and salmon (five Area E gillnet licences) (HFLP 2014). Commercial fisheries for halibut and sablefish are generally undertaken off the west coast of Vancouver Island (PMV 2015, LFN 2016).

Hunting / Trapping

Cowichan Nation Alliance has previously reported that Highway 99 was built on what was once a prime harvesting location for deer, ducks, and geese, among other species (CNA 2011). Canada goose, northern shoveler, and green-winged teal would have been available to the Cowichan people year-round (BKRC 2015).

The south shore of Lulu Island, along the South Arm of the Fraser River, has been reported as a prime spot for trapping beaver, mink, and muskrat; bear, grouse, elk, squirrel, and porcupine were also hunted by the Cowichan people on the South Arm (BKRC 2015, CT 2015). The Cowichan Nation Alliance as a group has stated a desire to resume the harvest of traditional resources in the Project area (CNA 2011, CT 2015).

The Cowichan Nation Alliance has also stated that its members revere bald eagles, which were not hunted. Their Elders have indicated that eagle numbers in the Richmond area have been dwindling each year. Breeding habitat along the Highway 99 corridor on Lulu Island has been previously noted (CNA 2011).

Gathering

Member bands of the Cowichan Nation Alliance report that in the marshy areas south of Canoe Passage near Brunswick Point – in the area of *Xwulits'um*, or place for cutting (cattails) – as well as in the area of *Tl'uqtinus* and across the Fraser River on Tilbury Island, several varieties of cattails and rushes (*stth'equn*) were once harvested (PMV 2015, PT 2014). Berries and other plants were gathered and cultivated by the ancestors of the Cowichan Nation Alliance member bands at *Tl'uqtinus*, and were harvested from other locations in the Project area. These plants included wild rose, rose hips, crabapples, elderberries, horsetail, labrador tea, Indian hemp, trembling aspen, mock orange, oregon grape, maple leaves, cranberries, blueberries, blackberries, wapato, bulrushes/reeds (*stth'equn*), as well as seaweed (BC and PMV 2012, BKRC 2015, CT 2015, HTG 2005, PT 2014, TMPL 2014, Woodward and Company 2011). With respect to berry plants at *Tl'uqtinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979; Woodward and Company 2011).

The Cowichan Nation Alliance has indicated that they wish to see existing bogs on Lulu Island near the Highway 99 corridor – specifically, one near Williams Road (which runs perpendicular to Highway 99) and another near the Richmond Nature Park (bisected by Highway 99 at Westminster Highway) – protected to support future use of traditional resources, like berries and other bog ecosystem flora. At *Tl'uqtinus*, which is currently surrounded by blueberry farms, the Cowichan Nation Alliance have raised the potential for their former berry grounds to be re-established (Woodward and Company 2011).

Related Interests

The Cowichan Nation Alliance has stated that it asserts Aboriginal title to *Tl'uqtinus*, and given where *Tl'uqtinus* is reportedly situated, to the Project footprint. The Cowichan Nation Alliance has expressed its view that this title includes the right to manage the land, determine the uses to which it can be put, and obtain any economic benefits from it. The Cowichan Nation Alliance has advised that it is also working to reestablish culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm and at the mouth of the Fraser River, including at and about *Tl'uqtinus* (CNA 2016a).

The Cowichan Nation Alliance has previously reported that for the last generation its member First Nations have been rejuvenating their access to the waterways that once served as the highways for their ancestors, working with the currents and tides to travel for FSC purposes. The Cowichan Nation Alliance has expressed concern regarding the contaminants and the sustainability of vital habitats that are necessary to support their members (PMV 2015).

Semiahmoo First Nation

Key sources relied upon for this summary are regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015) and ongoing consultation between the Ministry and Semiahmoo First Nation. As part of that ongoing consultation, Semiahmoo First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.8** for review and comment. Comments had not been received by the time of Application submission. The Ministry also notes that a Project-specific traditional use study was expected from the Semiahmoo First Nation, but that the study had not been received by the time of Application submission.

Semiahmoo First Nation has explained that their “traditional economy was based on animals or fish that move around, and that there is a circulatory effect from the Fraser River into Boundary and Semiahmoo Bays,” which form the centre of their asserted territory (**Appendix 10-A, Figure 10-7**) (BC and PMV 2012). They also report having “regularly traveled through and gathered a number of foodstuffs from their traditional territory, including the Fraser estuary, Boundary Bay and areas now in Washington State,” and that their “members continue to use their traditional territory for their traditional economy on both sides of the border” (SFN 2011a). This use includes fishing in the lower Fraser River, which the Semiahmoo have characterized as enabled by relationships with other First Nations (SA 2006).

The Semiahmoo understand their Aboriginal rights to include, “amongst other things, the right to practice their culture in its entirety and the right to food security as per the traditional economy”; however, they have reported that their ability to pursue a traditional economy has been “severely limited” by urbanization and contamination of their food supply within their traditional territory (SFN 2011a). They are therefore seeking to restore or maintain, within that territory, the conditions necessary to promote the exercise of ancestral uses in the future (SFN 2011b).

Fishing

Within their traditional territory, Semiahmoo First Nation has reported that they once fished for salmon, sturgeon, halibut, eulachon, herring, smelts, sea mammals (including hair seals, sea lions, and porpoises), and a range of beach foods (BC and PMV 2012). Important salmon

fishing areas have been previously identified as including but not limited to Cannery Point on the southeast tip of the Point Roberts Peninsula and the Nicomekl and Little Campbell rivers that feed into Boundary Bay, where sturgeon was also taken (BC 2006).

Semiahmoo First Nation has said that they practiced their fishing rights in the Fraser River in the summer season at *Ti'ektines*, in the vicinity of the north end of the George Massey Tunnel. They have previously “acknowledged that Cowichan Tribes fished in the South Arm of the Fraser River and that access to this area was gained by the Semiahmoo First Nation via a series of marriage ties between Semiahmoo First Nation and Cowichan Tribes” (BC and PMV 2012). Semiahmoo First Nation has also said that they have access rights to the Salmon River and Kanaka Creek, which both join the Fraser River in the vicinity of MacMillan Island, near Fort Langley (PMV 2015).

Salmon has been described as central to the Semiahmoo, and reef-netting, an off-shore salmon fishing technique employed by the Semiahmoo and other Northern Straits Salish-speaking peoples, was a key harvesting mechanism; however, the technique could only be effectively applied in specific areas within Georgia Strait (SA 2006). These areas included the waters surrounding the Point Roberts Peninsula (i.e., Roberts Bank and Boundary Bay). While the Semiahmoo are closely associated with Boundary Bay, they reportedly maintained residences at Roberts Bank for the purposes of managing the three to four reef-net locations they owned in that vicinity (BC 2006, SA 2006). Reef-net sites were owned by family groups and inherited by the first-born son (PMV 2015).

Coho and chum, which in their preserved form have been described as being vital winter food, were harvested by other techniques within Semiahmoo territory, including Nicomekl and Little Campbell rivers, which drain into eastern Boundary Bay on the Canadian side of the international border. Salmon was also harvested on the American side of Boundary Bay, in Dakota and California Creeks and around Tongue Spit in Drayton Harbor (PMV 2015).

Shellfish were also important to the Semiahmoo, and Boundary Bay has been characterized as formerly one of the most productive shellfish harvesting locations on the Pacific coast (Norman, n.d.). This feature is said to have made it a key shellfish harvesting location for the Semiahmoo and other First Nations, who reportedly shared the area for this purpose (BC and PMV 2012).

Semiahmoo report that the focus of their sea mammal harvesting was on seals. They have said that seals travelled as far up the Fraser River as Harrison Lake in pursuit of salmon (PMV 2015).

In 2006, the Senco'ten Alliance, a now defunct organization with which the Semiahmoo were once affiliated, advised that it had been “approximately two decades or so since Sencot'en members...owned boats and fished directly (commercially or otherwise) in the Roberts Bank

vicinity.” The organization also advised that “there are very close ties between Semiahmoo, Katzie and Tsawout and [that], within those communities, some Sencot’ en fishing is undertaken every year in the lower Fraser, as has been the tradition since before contact” (SA 2006).

Fisheries and Oceans Canada (DFO) records over the last six years indicate that Semiahmoo First Nation has held communal licences to fish for food, social and ceremonial (FSC) purposes in the Fraser River upstream of between Port Mann Bridge to Kanaka Creek-Derby Reach (DFO 2016a). In 2015, Chinook were targeted during two 12 hour openings, on August 10 and 11. In 2014, sockeye was targeted during two 12 hour openings, on August 5 and 6. There was no Semiahmoo access in 2013, and access in 2012 was limited to between Kanaka Creek-Derby Reach and Mission, again in August, with only sockeye targeted. There were four sockeye openings for Semiahmoo in August 2011, of between 9 and 12 hours each, and only two openings in August and September 2010. Semiahmoo licences in 2010 and 2011 applied to the Port Mann Bridge to Kanaka Creek-Derby Reach section of the river. No access was indicated for 2009. Communal licence records dating back to 2004 indicate that all Semiahmoo access, when permitted, has occurred upstream of the Port Mann Bridge. Semiahmoo report that they are not currently engaged in commercial salmon fisheries (PMV 2015).

Concerning other fish species harvested for traditional purposes, sturgeon once served as an important substitute for other fisheries; however, current conservation measures prohibit sturgeon retention. Semiahmoo report that they also consumed eulachon, which is also under conservation measures, but whether it was, in the past, directly harvested or obtained through trade was not identified (PMV 2015).

Current Semiahmoo crab harvesting for FSC purposes, targeting Dungeness, graceful, and red rock varieties, has typically ranged from June through December, although there have been years where no openings have been reported (2009, 2012 to present), and other years where the harvest has been open year-round (2010). In 2011, the harvest was licenced for June through December in Pacific Fishery Management Area 29-8 (Boundary Bay), which corresponds to commercial crab Area J. Semiahmoo report that currently they are not participating in the commercial crab fishery, which in their opinion is inadequately regulated and results in overharvesting, resulting in fewer crab for the FSC harvest, fewer Semiahmoo participating in the harvest, and fewer opportunities for transference of knowledge about crab harvesting to youth (PMV 2015).

The once productive shellfish grounds of Boundary Bay, as identified above and where Semiahmoo once harvested steamer, manila, and butter clams, was closed to bivalve harvesting in 1962 for sanitary reasons (Norman n.d.; PMV 2015). The American side of the bay was recently opened to restricted use (Norman n.d., SFN 2011a); however, a sanitary and

biotoxin closure remains in place in British Columbia (DFO 2016b). This key resource area around which Semiahmoo territory is centred has therefore been unavailable to them for several decades for the purposes of harvesting bivalve species. Semiahmoo have conveyed an interest in becoming involved in commercial shellfish harvesting, particularly of geoduck, and in developing aquaculture and commercial harvesting of sea cucumber (PMV 2015).

Hunting/Trapping

Semiahmoo hunting has been previously reported as concentrated in and around lands to the east of Boundary Bay, on both the Canadian and American sides of the border. Lake Terrell, approximately 6 km (as the crow flies) southeast of Birch Bay in Washington State, was an area in which Semiahmoo hunted for elk, deer, and beaver. Beaver is also said to have been taken at the heads of the Serpentine and Nicomekl rivers (present-day Surrey and Langley), as well as bear (BC and PMV 2012). Mountain goat was reportedly accessed outside of Semiahmoo territory, and specifically on the north side of the Fraser River, via a trail along Kanaka Creek (PMV 2015).

Cranes, ducks, geese, swans, and other migratory birds were reportedly harvested for food, while ducks and duck down were also utilized for ceremonial and textile purposes. It has been previously reported that Semiahmoo hunted ducks at Tongue Spit on Drayton Harbor north of Birch Bay, and at the mouths of Dakota and California creeks, which both drain into Drayton Harbor (BC and PMV 2012). Semiahmoo have said that duck hunting sites at Tongue Spit were family owned (PMV 2015).

Gathering

Camas has been described as harvested in the past by the Semiahmoo on Waldron Island in Washington State, across Boundary Pass from South Pender and Saturna islands. The Semiahmoo also reportedly had prairies behind their villages where they could harvest camas and other bulbs. Gathered plants were exchanged with other nations for other foodstuffs; for example, the Semiahmoo reportedly received potatoes from the Snokomish at Blackie Spit, at the mouth of the Nicomekl River, after the founding of Fort Langley in 1827 (BC and PMV 2012).

Aquatic plants were also harvested, including bulrushes, tule rushes, and grasses. These were reportedly used extensively in the manufacture of mats, which were in turn used for a variety of purposes, including housing materials, beds, and food preparation. Mats have also been described as an important trade item; for example, they were once traded with the Nuuchahnulth nations for halibut. Tule rushes were harvested in May, and bulrushes in July. Gathering

locations for tule rushes and bulrushes are said to have included Burns Bog and the San Juan Islands, while grasses, used to bind the edges of mats, were found in parts of the Fraser River Valley (PMV 2015).

Semiahmoo reportedly practiced selective burning to boost berry plant growth, which also had the effect of increasing the availability of deer. Blackberries, blueberries, dew berries, huckleberries, salmon berries, Saskatoon berries, and thimbleberries were important summer harvests for Semiahmoo; gooseberries, raspberries, and strawberries were also consumed, but were not as common. Semiahmoo First Nation has said cranberry harvesting provided seasonal employment for their members following non-Aboriginal settlement (VAFFC 2011, PMV 2015).

Among other plants used traditionally by Semiahmoo have been identified as devil's club, rose hip, stinging nettle, and the wood, bark, or roots of various tree species (e.g., cedar, cherry, fir, spruce, willow, and yew), for a variety of purposes (VAFFC 2011, PMV 2015). The lower Fraser River, in the vicinity of Deas and Tilbury Islands, has previously been identified as an area where current plant harvesting by Semiahmoo may still occur (VAFFC 2011).

Related Interests

Semiahmoo First Nation has said that the use of lands and resources, access to which they report as now limited, has a spiritual and sacred element not readily separated from practical considerations. Legendary stories are also integrated into this world view, which relay that people related to the first ancestors, who descended from the sky, were transformed by Khaals (i.e., a mythical leader) into physical and biological elements of the landscape, and who remain relatives of the Semiahmoo. The Semiahmoo therefore consider themselves part of the landscape, of their territory, and this landscape serves as their sacred place, their history book, their storehouse of raw materials, as well as their training ground (PMV 2015).

Named places in the vicinity of the Project area previously reported by Semiahmoo include *SĆUOƧEN*, or Tsawwassen, as well as three sites on the the eastern aspect of the Point Roberts Peninsula, fronting Boundary Bay, as follows from north to south: *ŒESEWEL*, *ŚAWOM*, and *ĆEL,ŁTENEM* (also rendered *Chelhtenem* or *Tsel-lhtenem*, at Cannery or Lily Point). *ĆEL,ŁTENEM* has been previously identified as a summer residence of the Semiahmoo, as well as an important reef-net location for sockeye, while another summer residence of the Semiahmoo, where clams were harvested, has been previously identified in the vicinity of *ŒESEWEL* and *ŚAWOM*. One named place has also been previously identified along the main stem of the Fraser River upstream of the Port Mann Bridge, at *KITEY*, or Katzie (PMV 2015).

Squamish Nation

Key sources relied upon for this summary are publicly available information, as cited, and ongoing consultation between the Ministry and the Squamish Nation. As part of that ongoing consultation, Squamish was provided with a draft of this summary and the information that appears in **Section 10.1.1.9** for review and comment. Comments had not been received by the time of Application submission; however, Squamish Nation provided a shapefile of the territorial boundary that appears in **Appendix 10-A, Figure 10-8**).

Fishing

While Squamish Nation territory (**Appendix 10-A, Figure 10-8**) reportedly extends south as far the South Arm of the Fraser River, Squamish Nation do not currently fish directly in the Fraser River for food, social or ceremonial (FSC) purposes based on information previously reported by Squamish Nation (SN 2014) and a review of Fisheries and Oceans Canada (DFO) records regarding “Lower Fraser River Fisheries” from the last few years (DFO 2016). According to those DFO records, Howe Sound and the Squamish River have been the key areas for Squamish Nation salmon harvesting, and specifically within Pacific Fishery Management Area (PFMA) 28, subareas 28-2 to 28-4. Over the period 2013 to 2015, FSC salmon fishing in these areas was identified as taking place over several openings between July and December (DFO 2016).

As with salmon, Squamish Nation has also been licenced to harvest crab, prawn, and shrimp for FSC purposes in PFMA 28-2 to 28-4, and therefore well north of the Fraser River. From 2013 to 2015, the Squamish Nation were licenced to harvest crab (targeting Dungeness, graceful, and red rock) and shrimp within Howe Sound (PFMA 28-2 to 28-4), from mid-June through December. In 2015, the shrimp species targeted were coonstripe, humpback, pink (including flexed and smooth), and sidestripe. Squamish Nation was also licenced to harvest prawn in the same locations and during the same time frame (i.e., mid-June through December), but with four additional openings in January and February of 2013 (DFO 2016).

Squamish Nation report that, historically, they harvested Fraser River sockeye, based on family ties with other First Nations (i.e., Musqueam), and that Squamish presence on the Fraser River is well documented in historic accounts, including one from 1827. They have said that there is no other source for sockeye in Squamish Nation territory, and that fishing sockeye on the Fraser is integral to Squamish Nation culture. Accordingly, for many years, including initiating a formal request to DFO in 2011, Squamish Nation say they have sought an increase to their Fraser River sockeye allocation for FSC purposes (20,000 pieces) and an extension of their FSC fishing area to include the Lower Fraser River. Squamish Nation report that their current allocation per member is about 5 sockeye, which they say is the lowest per capita of any First

Nation that accesses Fraser River sockeye, and falls far short of their food needs. They have requested that their current allocation, set in 1992, be increased to 70,000 pieces, or 17 pieces per member. The current FSC allocation of Fraser River sockeye is reportedly obtained by a contracted seine boat that harvests in the Johnstone Strait area, outside Squamish Nation territory and traditional fishing areas. Squamish Nation has said that by expanding their FSC fishing area to include the Lower Fraser River, they would be able to fish Fraser River sockeye the way their ancestors did (i.e., directly) and re-establish their historical connections to the area (SN 2014).

Hunting/Trapping

Past, present, or desired future hunting or trapping of resources by the Squamish Nation in the vicinity of the Project area was not identified in sources reviewed.

Gathering

Past, present, or desired future gathering of terrestrial resources by the Squamish Nation in the vicinity of the Project area was not identified in sources reviewed.

Related Interests

Further information relating to Squamish Nation interests in the vicinity of the Project area beyond that provided above was not identified in sources reviewed.

Stz'uminus First Nation

Key sources relied upon for this summary are the George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands (BKRC 2015); Historical Geography of Cowichan Land Use and Occupancy, Lower Fraser River: Map Series and Report (Brealey 2010); Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area (CT 2015); a map showing "Cowichan Land Use" in the Project area, provided by Penelakut Tribe (PT 2014); regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Stz'uminus First Nation. As part of that ongoing consultation, Stz'uminus was provided with a draft of this summary and the information that appears in **Section 10.1.1.1** for review and comment. Comments were received from the Cowichan Nation Alliance, on behalf of the four member First Nations, and have been incorporated. In this summary, specific information on Stz'uminus First Nation's traditional use has been supplemented with general information on traditional use by Cowichan Nation Alliance and Hul'qumi'num Treaty Group Nation Alliance member First Nations.

The Project area intersects with the claimed core territory or “title lands” of the member First Nations of the Hul’qumi’num Treaty Group, including *Tl’uq̓tinus* (**Appendix 10-A, Figure 10-2**), which lies along the Fraser River less than 4 km upstream from the north end of the George Massey Tunnel (BKRC 2015). *Tl’uq̓tinus* has been described as a “great summer village of the Cowichan-speaking people of Vancouver Island” (Suttles 2004), with “winter-village style houses” (Rozen 1985) surrounded by cultivated grounds (see **Plate 1** below). More recently, *Tl’uq̓tinus* has been described as a permanently occupied, multi-seasonal Cowichan Nation settlement (Brealey 2010), with a significant winter population and a summer population in the thousands (BKRC 2015). The lands over which *Tl’uq̓tinus* is said to have extended along the south shore of Lulu Island have been reported as “conservatively located on portions of Sections 21, 22, 23, 24, 26, 27, 28, 33, and 34 of Block 4 North, Range 5 West, as well as a waterfront portion of Block 4 North, Range 4 West” (Woodward and Company 2011).

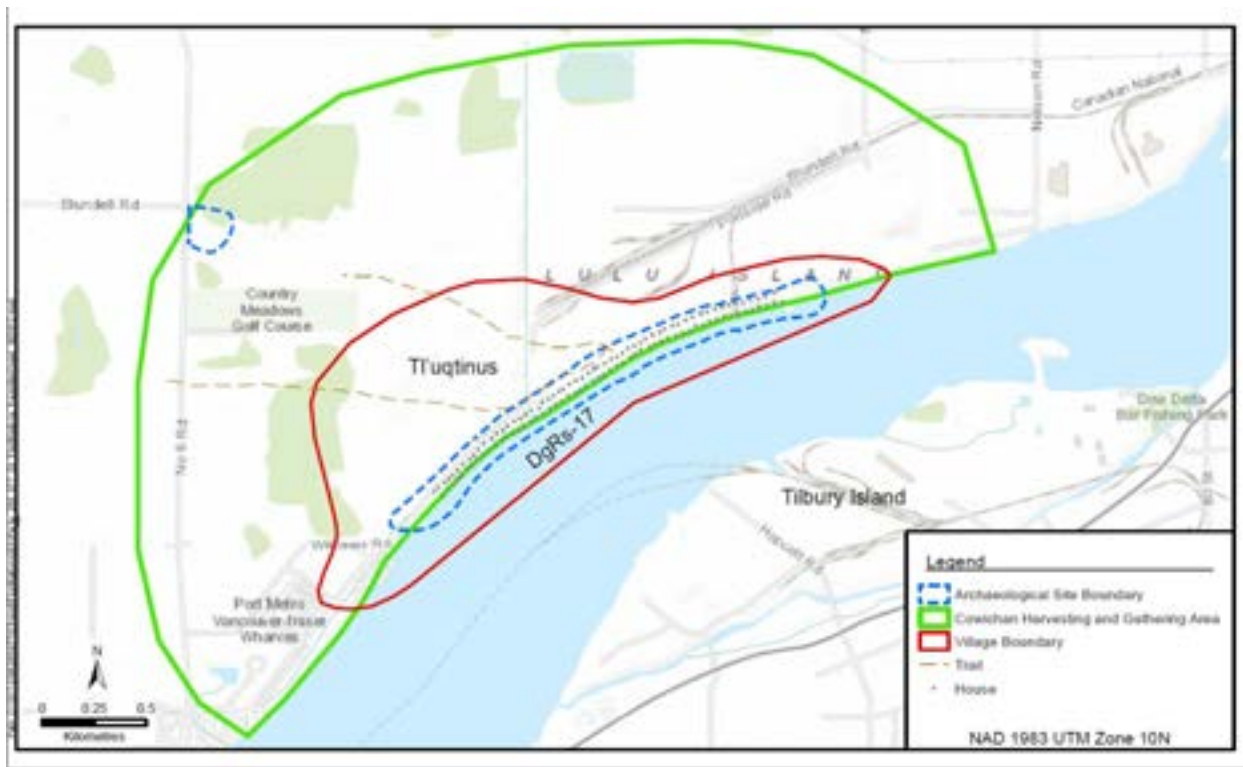

Plate 1. Lands of *Tl’uq̓tinus* Claim Area (CNA 2016a).¹⁰

¹⁰ This figure is a representation of information provided by the Cowichan Nation Alliance regarding *Tl’uq̓tinus* (2016a) in the context of consultation on the Project and does not constitute an admission, acknowledgment, or endorsement of that claim, position, or the accuracy of the information by the Ministry.

The Cowichan Nation Alliance has stated that *Tl'uqtinus* was a home base occupied and used exclusively by the Cowichan Nation, the descendants of which are members of the First Nations represented by the Cowichan Nation Alliance (CT 2015), as well as other member bands affiliated with the Hul'qumi'num Treaty Group (BC and PMV 2012, CT 2015, Woodward and Company 2011). This shared or joint occupation and use reportedly extended from well before 1792 until after 1859 (Woodward and Company 2011), and constituted a base of operations for a shared land use regime that reached up the Fraser River at least as far as the fisheries at the Fraser Canyon (Brealey 2010). As indicated in **Section 10.1.1.1**, the Cowichan Nation Alliance is working to reestablish a permanent land base and river access at *Tl'uqtinus* for residential and/or commercial purposes (CNA 2016a,b).

Fishing

Stz'uminus followed a seasonal round of resource use and regional settlement that took them from their winter residences on Vancouver Island and the Gulf Islands across the Strait of Georgia to the Fraser River estuary, where they resided for all or part of the annual salmon runs (April to through October), or, in some instances, year-round (BC and PMV 2012, CT 2015, HTG 2005, Rozen 1985). Seasonal movements reportedly involved the relocation of entire households, including house planks and supplies, from location to location within the collective traditional territory, between three and five times annually. Within this round, the Fraser River estuary has been described as the “most important economically” (HTG 2005). Species harvested historically on the South Arm of the Fraser River included sockeye and pink salmon, sturgeon, shellfish, and marine mammals; dried clams and other foodstuffs (e.g., camas) were also traded to other First Nations while *Hul'q'umi'num'*-speaking groups were resident in and around the area (BC and PMV 2012, BKRC 2015). The Cowichan Nation Alliance has previously reported that now filled-in sloughs and streams in or near Highway 99 once supported coho and eulachon, which were also harvested while resident on the Fraser River (CNA 2011). Stz'uminus used *Tl'uqtinus* seasonally for the foregoing purposes (TMPL 2014). Stz'uminus also used other habitation sites in the area, including one at Steveston (BC and PMV 2012, TMPL 2014).

Areas within the wider Fraser River estuary were also utilized by *Hul'q'umi'num'*-speaking peoples for fishing salmon, sturgeon, groundfish, and other marine resources on the foreshore (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HTG 2005). Certain species (e.g., sockeye and pink salmon, sturgeon, eulachon, trout, flounder) could only be obtained in, or were preferred to be taken at, Fraser River-based locations within their trans-Georgia Strait settlement round. Sockeye salmon and eulachon in particular could not be found in any river within Cowichan Nation's territory on Vancouver Island (CT 2015).

The Hul'qumi'num Treaty Group have reported that during the reserve creation era in the late nineteenth century, government officials were aware of *Hul'qumi'num Mustimuhw* fishing interests at the Fraser River; however, no reserves were set aside for them in the area (HTG 2005). The Hul'qumi'num Treaty Group have also reported that government regulations introduced in the same era also had the effect of restricting their access to fishing in the Fraser River. Despite these changes, *Hul'qumi'num Mustimuhw* say they continued to use the Fraser River for fishing, including commercially, into the early twentieth century (CT 2015, HTG 2005, TMPL 2014).

Member First Nations of the Cowichan Nation Alliance have been attempting to restore former fisheries within the Fraser River through Fisheries and Oceans Canada (DFO) (Cohen Commission 2011). Access to sockeye for member First Nations (including other members of the Hul'qumi'num Treaty Group) is said to be provided by DFO annually in Johnstone Strait and “off the mouth of the Fraser River” (Cohen Commission 2011). In the vicinity of the Project area, however, access has been subject to negotiations with First Nations local to the lower Fraser River, and has been limited, occurring only in 2005, 2006, and 2008 (DFO 2016). In those years, the specific locations in the South Arm in which member First Nations of the Hul'qumi'num Treaty Group fished for food, social, and ceremonial (FSC) purposes under communal licences was below the Port Mann Bridge generally, as well as specifically, on some occasions, below the easterly point of Kirkland Island (i.e., downstream of the Project area) (DFO 2016). DFO records for communal FSC licences in the Fraser River downstream of the Port Mann Bridge do not suggest that any of these groups, individually or collectively, has had access to fisheries in this area in the last eight years (DFO 2016). The Cowichan Nation Alliance has stated that it is in ongoing, active litigation over its asserted fishing rights on the South Arm of the Fraser River (CNA 2016a).

Stz'uminus participates in the Hul'qumi'num Fisheries Limited Partnership (HFLP), a commercial fishing business, with Halalt First Nation and Penelakut Tribe. Species harvested through this enterprise are crab (one Area H licence), prawn (two local / coast wide licences), halibut (one licence and annual TAC quota), herring (13 gillnet and 1 seine), rockfish (two Area Inside licences, targeting yelloweye, quillback, copper, china, and tiger), sablefish (annual TAC quota), and salmon (five Area E gillnet licences) (HFLP 2014). Commercial fisheries for halibut and sablefish are generally undertaken off the west coast of Vancouver Island (PMV 2015, LFN 2016).

Hunting / Trapping

Cowichan Nation Alliance has previously reported that Highway 99 was built on what was once a prime harvesting location for deer, ducks, and geese, among other species (CNA 2011). Canada goose, northern shoveler, and green-winged teal would have been available to the Cowichan people year-round (BKRC 2015).

The south shore of Lulu Island, along the South Arm of the Fraser River, has been reported as a prime spot for trapping beaver, mink, and muskrat; bear, grouse, elk, squirrel, and porcupine were also hunted by the Cowichan people on the South Arm (BKRC 2015, CT 2015). The Cowichan Nation Alliance as a group has stated a desire to resume the harvest of traditional resources in the Project area (CNA 2011, CT 2015).

The Cowichan Nation Alliance has also stated that its members revere bald eagles, which were not hunted. Their Elders have indicated that eagle numbers in the Richmond area have been dwindling each year. Breeding habitat along the Highway 99 corridor on Lulu Island has been previously noted (CNA 2011).

Gathering

Member bands of the Cowichan Nation Alliance report that in the marshy areas south of Canoe Passage near Brunswick Point – in the area of *Xwulits'um*, or place for cutting (cattails) – as well as in the area of *Tl'uqtinus* and across the Fraser River on Tilbury Island, several varieties of cattails and rushes (*stth'equn*) were once harvested (PMV 2015, PT 2014). Berries and other plants were gathered and cultivated by the ancestors of the Cowichan Nation Alliance member bands at *Tl'uqtinus*, and were harvested from other locations in the Project area. These plants included wild rose, rose hips, crabapples, elderberries, horsetail, labrador tea, Indian hemp, trembling aspen, mock orange, oregon grape, maple leaves, cranberries, blueberries, blackberries, wapato, bulrushes/reeds (*stth'equn*), as well as seaweed (BC and PMV 2012, BKRC 2015, CT 2015, HTG 2005, PT 2014, TMPL 2014, Woodward and Company 2011). With respect to berry plants at *Tl'uqtinus* specifically, a 1979 map produced by Environment Canada noted an “Indian residence” at this location, accompanied by the caption (not attributed to any specific Aboriginal group): “It is known that the Indians who lived here for several thousand years harvested berries from the bogs and used fire to maintain open areas for the berry bushes by preventing encroachment from pine trees” (North et al. 1979; Woodward and Company 2011).

The Cowichan Nation Alliance has indicated that they wish to see existing bogs on Lulu Island near the Highway 99 corridor – specifically, one near Williams Road (which runs perpendicular to Highway 99) and another near the Richmond Nature Park (bisected by Highway 99 at Westminster Highway) – protected to support future use of traditional resources, like berries and other bog ecosystem flora. At *Tl'uqtinus*, which is currently surrounded by blueberry farms, the Cowichan Nation Alliance have raised the potential for their former berry grounds to be re-established (Woodward and Company 2011).

Related Interests

The Cowichan Nation Alliance has stated that it asserts Aboriginal title to *Tl'uqtinus*, and given where *Tl'uqtinus* is reportedly situated, to the Project footprint. The Cowichan Nation Alliance has expressed its view that this title includes the right to manage the land, determine the uses to which it can be put, and obtain any economic benefits from it. The Cowichan Nation Alliance has advised that it is also working to reestablish culturally integral practices (e.g., harvesting fish, waterfowl, plants) on the South Arm and at the mouth of the Fraser River, including at and about *Tl'uqtinus* (CNA 2016a).

The Cowichan Nation Alliance has previously reported that for the last generation its member First Nations have been rejuvenating their access to the waterways that once served as the highways for their ancestors, working with the currents and tides to travel for FSC purposes. The Cowichan Nation Alliance has expressed concern regarding the contaminants and the sustainability of vital habitats that are necessary to support their members (PMV 2015).

Tsawwassen First Nation

Key sources relied upon for this summary are the Tsawwassen First Nation *George Massey Tunnel Replacement: Project Impact Study* (GMT 2015), Tsawwassen First Nation Final Agreement (TFNFA, TFN et al. 2009a,b), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015a,b), and ongoing consultation between the Ministry and Tsawwassen First Nation regarding the Project. As part of that ongoing consultation, Tsawwassen First Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.10** for review and comment. The Ministry is aware that Tsawwassen First Nation expressed general satisfaction with the information provided for review but had received no specific comments by the time of Application submission.

The rights specified under the TFNFA, which are limited by measures necessary for conservation, public health, and public safety, include (TFN et al. 2009a):

- Tsawwassen First Nation Fishing Right, including harvesting aquatic plants;
- Tsawwassen First Nation Right to Harvest Migratory Birds;
- Tsawwassen First Nation Right to Harvest Wildlife;
- Tsawwassen First Nation Right to Gather Plants;
- Tsawwassen First Nation Right to Harvest Renewable Resources; and
- Tsawwassen First Nation Right to Practice Tsawwassen First Nation Culture.

The nature and extent of these treaty rights, and areas to which these treaty rights apply, are described in the relevant sections that follow below and shown in **Appendix 10-A, Figure 10-9**.

Fishing

Marine resources are largely discussed in Chapter 9 of the TFNFA (TFN et al. 2009a). Under the TFNFA, “fish” are defined as fish, intertidal bivalves and other shellfish, crustaceans, and marine animals (excluding cetaceans), the parts of these fish, as well as their the eggs, sperm, spawn, larvae, spat, juvenile stages and adult stages. “Intertidal bivalves” are further defined as manila clams, littleneck clams, butter clams, horse clams, soft-shell clams, varnish clams, blue mussels, cockles, and oysters. The Tsawwassen Fishing Area, which applies to fish and aquatic plants but excludes intertidal bivalves, takes in all or portions of PFMA 29 subareas 29-3, 29-4, 29-6 through 29-14 and 29-17. These subareas cover the waters of the Main Arm of the Fraser River westerly of the power lines downstream of the Port Mann Bridge, the waters of the North Arm of the Fraser River from the junction of the Main Arm downstream to the Arthur Laing Bridge, the Middle Arm of the Fraser River, the South Arm of the Fraser River, and parts of the waters of the Strait of Georgia and Boundary Bay (TFN et al. 2009b, Appendix J-1). Tsawwassen report that they actively fish in the South Arm of the Fraser River and within the Project area, and that portions of the Project occur within the two subareas 29-13 (Canoe Pass to Deas Island) and 29-14 (Steveston to Pattullo Bridge) (TFN 2015). Canoe Pass and the waters in and around Rose-Kirkland Island (i.e., Ladner Reach, Woodward Reach), which lie about 1 km downstream of the Project area, have been previously described as particularly important fishing areas (VAFFC 2011, BC and PMV 2012).

The right to harvest fish allows designated members of the Tsawwassen First Nation to exercise the right for domestic purposes and to trade or barter those fish among themselves or with other Aboriginal people resident in BC (TFN et al. 2009a, Chapter 9). Domestic allocations for sockeye, chum, pink, chinook, and coho salmon, which are centrally important to the

Tsawwassen First Nation, are calculated using formulas described in the TFNFA; generally, set at 625 Chinook, 15,226 sockeye, 2,500 pink (odd years only), 500 coho, and 2,576 chum (TFN et al. 2009b, Appendix J-2). Retained catch for the period 2009 through 2015 is presented in **Table 10.1-7**.

Table 10.1-7 Tsawwassen Domestic Salmon Catch (Kept), 2002 to 2015

| Species | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|---------|-------|--------|-------|-------|--------|--------|--------|
| Chinook | 995 | 338 | 583 | 440 | 726 | 1,060 | 598 |
| Sockeye | 1,132 | 15,226 | 9,995 | 6,649 | 5,118 | 94,452 | 2,851 |
| Pink | 72 | 2 | 84 | 2 | 16,156 | 7 | 20 |
| Coho | 57 | 3 | 43 | 22 | 220 | 159 | 11 |
| Chum | 1,320 | 2,019 | 214 | 2,577 | 8,508 | 8,462 | 10,446 |

Source: (DFO 2016)

In 2009, Tsawwassen harvested salmon for domestic purposes during 27 openings (April 15 to November 15); in 2010 during 14 openings (June 20 to October 31); and in 2012, during 18 openings (June 17 to October 14) (PMV 2015a).

In 2013, Tsawwassen First Nation fished under communal licence for chinook salmon (8 to 18 hour openings, May 18, June 1, 8, 15, 22, 29, July 7, 13, 20, August 10, 11, 30, 31, September 1); sockeye salmon (24 to 36 hour openings, July 27 to 28, August 3 to 4); and chum salmon (36 to 48 hour openings, October 5 to 6, 12 to 14). There were no coho openings (although catch statistics report retained coho), and pink salmon were not harvested for domestic purposes in 2013 (see below); however, there were two additional “limited participation” fisheries (i.e., for ceremonial purposes) for chinook salmon in late August (PMV 2015a).

In 2014, Tsawwassen First Nation fished under communal licence for chinook salmon (8 to 48 hour openings, May 18, 24, 31, June 7, 14, 21 to 22, 27 to 29, July 4 to 6, 11 to 13, 18 to 20, August 31); sockeye salmon (12 to 24 hour openings, July 26 to 27, August 2 to 3, 10); and chum salmon (24 to 48 hour openings, October 4 to 5, 10 to 12, 18 to 19). There were no coho or pink salmon openings (although catch statistics report retained coho). There were two “limited participation” fisheries for sockeye salmon (4 hour openings, August 23 and September 12) in 2014 (DFO 2016).

In 2015, Tsawwassen First Nation fished under communal licence for chinook salmon (12 to 36 hour openings, May 2 to 3, 9 to 10, 23 to 24, June 6 to 7, 13 to 14, 20 to 21, 27 to 28, July 27, 28, 31, August 2 to 3, 10 to 11, 22, 23, 29, 30, September 5, 6); sockeye salmon (12 hour opening, August 1); and chum salmon (8-36 hour openings, October 10 to 11, 17, 18). There were no coho or pink salmon openings (although catch statistics report retained coho). There was one “limited participation” fishery for chinook salmon in 2015 (6 hour opening, July 25) (DFO 2016).

In addition to domestic fishing, the Tsawwassen First Nation Harvest Agreement, which is a contractual arrangement between the parties to the TFNFA that is separate from the TFNFA and does not “create, recognize or affirm aboriginal or treaty rights”, is intended to increase commercial fishing capacity for the Tsawwassen First Nation (TFN 2015). The Tsawwassen First Nation Harvest Agreement provides for an annual commercial allocation of Fraser River sockeye, chum, and pink salmon (odd years only). These commercial allocations vary with the size of the Canadian Commercial Total Allowable Catch (TAC) for sockeye and pink salmon and the Terminal Commercial Catch for chum salmon (TFN 2015). In 2013, there were seven openings for these purposes for pink salmon in September, and two openings for chum salmon in late October. In 2014, there were nine commercial openings for sockeye salmon in August and September, and two openings for chum salmon in late October. There were also two commercial openings for chum salmon in late October 2015 (DFO 2016).

The Tsawwassen First Nation Harvest Agreement is supported by the Tsawwassen Commercial Fish Fund and Tsawwassen Commercial Crab Fund, the monies from which are used to secure general commercial licences for salmon or crab for conversion to Tsawwassen First Nation Harvest Agreement licences (PMV 2015a). While commercial fishing by Tsawwassen members, either under a general commercial fishery licence or a Tsawwassen First Nation Harvest Agreement licence, is not treaty protected, the TFNFA does provide that Tsawwassen will be advised appropriately of any proposal to establish new emerging commercial fisheries in PFMA 14 through 20, 28, and 29 (the last of which includes the Project area), and will be consulted on the process for entry into and determining allocations for those fisheries (Chapter 9, paragraphs 106-107, cited in PMV 2015a). The TFNFA also requires that Canada compensate Tsawwassen if it reduces the number of licences or terminates the Tsawwassen First Nation Harvest Agreement (TFN 2015).

Fraser River eulachon, a traditional species, are fished in Canoe Passage in limited quantities (up to 50 lbs (23 kg) on average) for specific domestic purposes, typically in April and May, and only after conservation goals have been met. Three to six licences for eulachon were issued between 2009 and 2011 (TFN 2010, 2011, 2012); no licences were issued in 2012, and

only two were issued in 2013. Four licences were issued in 2014, and fisheries were limited to 6-hour periods on April 25 and 26, and on May 1 and 2. Another four licences were issued in 2015, with openings limited to 6-hour periods on April 11, 18, and 26, and on May 1 (DFO 2016). Tsawwassen report that eulachon, once very abundant, in particular in Canoe Passage, is now only available for distribution to Elders. They have expressed concern that any impact to eulachon may lead to a complete collapse of the species. Herring, another traditional species of continuing importance (MOT 2006), is not currently harvested, nor is herring spawn, which has been observed locally on crab traps (PMV 2015a).

Canoe Passage was once a key sturgeon harvesting area. Neither sturgeon nor steelhead can be kept due to conservation concerns. Sturgeon is among released salmon by-catch, largely in the stretch between Canoe Passage to Deas Island (PFMA subarea 29-14); however steelhead is rarely caught as by-catch (PMV 2015a). Trout and char are not identified in the annual post-season fisheries reports that have been generated since the TFNFA came into effect.

Groundfish (i.e., rockfish, lingcod, halibut, dogfish, and sole) may be harvested year-round for domestic purposes in the Tsawwassen Fishing Area. This harvest has not occurred since the TFNFA came into effect (TFN 2010, 2011, 2012). Tsawwassen report the return of halibut to the Roberts Bank area, and the harvesting of dogfish has occurred in the shallows near the Roberts Bank terminal. Rockfish, dogfish, and halibut are used for food as well as crab bait, with rockfish being the preferred species for bait as it discourages seals from interfering with the traps. Sole, and flounder, present in Canoe Passage, are reported to be small, and some flounder appear to be diseased (i.e., with growths or black spots). They are among released crab and salmon by-catch (PMV 2015a).

Since the TFNFA came into effect, four to five licences have been issued for the domestic crab harvest, targeting Dungeness, graceful, and red rock species; domestic harvests of crab are currently not subject to allocation limits and are permitted throughout the year. In 2009, 2011, and 2012, only Dungeness crab were kept (24,712, 20327, and 24,441, respectively); while in 2010 two red rock crab were kept along with 21,588 Dungeness crab. Tsawwassen report that since 2010 they have been operating a live holding tank to aid in the distribution of crab to their members throughout the year, and to prepare events such as Elder gatherings (PMV 2015a).

Tsawwassen report commercial crab harvesting currently occurs in Crab Management Area I, from June through November (PMV 2015a; see above for details about the relevance of the Tsawwassen First Nation Harvest Agreement to commercial crab fishing).

Shrimp and prawn may be harvested for domestic purposes at any time of year under the TFNFA; however, although a harvest document was issued in 2010, no recorded harvests have been made since the TFNFA came into effect (TFN et al. 2009a, PMV 2015a). Tsawwassen members report an interest in harvesting prawn on the eastern side of the Strait of Georgia. In areas where crabbing currently occurs (i.e., Roberts Bank and Boundary Bay), shrimp (copepods) have been caught as by-catch, along with other marine invertebrates such as sea pens, octopus, and amphipods (PMV 2015a).

Intertidal bivalves may be harvested in the Tsawwassen Intertidal Bivalve Fishing Area, which lies in PFMA 18 and includes the shorelines around Galiano Island, Mayne Island, Samuel Island, Saturna Island, and Tumbo Island (TFN et al. 2009b, Appendix J-1). Tsawwassen First Nation is in consultation with Hul'qumi'num nations to discuss intertidal bivalve fishing in areas of overlap with the traditional territories of those nations (TFN 2010, 2011, 2012). There has been no harvest of intertidal bivalves in the designated areas since the TFNFA came into effect (TFN 2010, 2011, 2012). Tsawwassen has expressed interest in developing shellfish aquaculture (PMV 2015a).

Tsawwassen report that from Sturgeon Bank south to Point Roberts, clams, cockles, mussels, oysters and abalone were once harvested by their members for food and other purposes such as trade and ceremonial regalia. Boundary Bay was considered an important harvesting area for bivalves, especially clams, cockles, and oysters, while scallops, sea cucumbers were taken from Boundary Bay through to Canoe Passage. Tsawwassen Elders report barnacles, which were harvested by being scraped from rocks, have reduced in size over the years. They also note that abalone, along with a large oyster bed (lying just south of the B.C. Ferries Terminal), began to disappear after development in the Roberts Bank area (i.e. Roberts Bank terminals and B.C. Ferry Terminal). The Elders have also reported that they stopped harvesting shellfish from the area before DFO put in place the existing biotoxin and sanitary closures (prohibiting harvesting of edible bivalves in several areas, including PFMA 29, restricting them from harvesting what was formerly a mainstay of their diet along the eastern side of the Strait of Georgia (PMV 2015a).

Aquatic plants (including attached and detached kelp and seaweeds) may be harvested for domestic purposes in the Tsawwassen Fishing Area at any time of day or year. These plants are specifically defined in the TFNFA as all benthic and detached algae, brown algae, red algae, green algae, golden algae and phytoplankton, and all marine and freshwater flowering plants, ferns and mosses, growing in water or soils that are saturated during most of the growing season (see "Gathering" section, below). Harvesting of these plants has not occurred since the TFNFA came into effect (2010, 2011, 2012).

Tsawwassen have previously reported that bulrushes have been harvested for basketry, and also for their medicinal properties. Tsawwassen members have also previously reported that at one time, seaweed grew “all over” and would be, along with sea asparagus, harvested “all along the shoreline” of Tsawwassen’s main community, although there is currently little to none reportedly left in these areas (PMV 2015a).

Marine mammals, including porpoise, seals, and sea lions, were once harvested by the Tsawwassen within the mouth and estuary of the Fraser River (VAFFC 2011). These marine animals (with the exception of porpoise, a cetacean) fall within the meaning of fish under the TFNFA (TFN et al. 2009a, Chapter 9). Tsawwassen have indicated that the community does not currently harvest marine mammals and that there is no desire to harvest marine mammals; however, they remain culturally important to the community (PMV 2015b).

Tsawwassen report seals are interfering with crab and fish harvesting, opening traps and damaging nets in search of food. They attribute this behaviour to an over-population of seals in this area, and a lack of Chinook (spring) salmon, a species declining in numbers. Seals have also been observed travelling further up the Fraser River than previously, including beyond the Alex Fraser Bridge. Tsawwassen explain they are increasingly fishing closer to New Westminster to avoid conflicts with the seals (PMV 2015a).

Hunting / Trapping

“Wildlife” is defined under the TFNFA as all vertebrate and invertebrate animals, including mammals, birds, reptiles, and amphibians, and the eggs, juvenile stages, and adult stages of these animals. The definition excludes fish (see previous section) and migratory birds.

“Migratory birds” means birds, as defined under federal law enacted further to international conventions, and includes their eggs.

The Tsawwassen Wildlife Harvest Area and Tsawwassen Migratory Bird Harvest Area are coextensive with Tsawwassen Territory (TFN et al. 2009b, Appendix K-1 and Appendix L-1); these areas therefore overlap the Project area. Specific species and harvesting sites (except Burns Bog for wildlife) are not identified in the TFNFA; however, locations near the Project area have been previously identified as preferred wildlife and migratory bird harvesting areas, particularly for deer, beaver, ducks, and geese. These locations include the south side of Lulu Island, the small islands, sloughs, marshes, and tidal flats of the Lower Fraser River, as well as the tidal flats at Boundary Bay (BC and Canada 2006, BCTC 2006, MOT 2006, BC and Canada 2008).

The Tsawwassen First Nation's right to harvest wildlife and migratory birds allows designated members to harvest wildlife and migratory bird resources for domestic purposes and to trade or barter wildlife, wildlife parts, and migratory birds among themselves or with other Aboriginal people resident in BC (TFN et al. 2009a, Chapter 10 and Chapter 11). Harvested wildlife, wildlife parts (including meat and furs), migratory birds, and inedible migratory bird by-products (including down) may also be sold if the sale is permitted by federal, provincial, and Tsawwassen law (VAFFC 2011). Wildlife and migratory bird harvesting rights may be exercised on private land (with the owner's permission) and, in the case of migratory birds, within National Wildlife Areas (with Canada's permission). With respect to wildlife harvesting specifically, the TFNFA acknowledges the "limited existing opportunity to harvest Wildlife and the likely future diminution or loss of any meaningful opportunity to harvest Wildlife in the Tsawwassen Wildlife Harvest Area" (TFN et al. 2009a, Chapter 10, paragraph 9).

At present, the Tsawwassen First Nation is not harvesting any wildlife or migratory bird species for which a conservation risk has been identified. Harvesting of migratory birds is permitted throughout the year (TFN et al. 2009a, Chapter 11).

Tsawwassen First Nation hunters have previously described locations throughout their traditional territory as preferred harvesting areas for wildfowl, including all of what are now Tsawwassen First Nation Lands and nearby fields, the shoreline from west of the Roberts Bank causeway up to and including Brunswick Point, and areas in and around Westham Island. Species harvested in the past include mallards, snow geese, and brant along the foreshore, and pintails, teals and wigeons in the back fields. Pheasants were previously taken "all over", and quail was also eaten (PMV 2015a). Other species identified as valuable are gadwall, goldeneye, bufflehead, and canvasback ducks; as well as Canada geese, gulls, and songbirds (TFN 2015).

Tsawwassen explain that birds are no longer as abundant as they once were, with some species, such as the pheasant, now scarcely found and others, such as geese, preferring Boundary Bay over Roberts Bank to nest (PMV 2015). They identify the following factors as impeding access to preferred areas, including development, privatization of lands, dangers related to discharging firearms in public areas, and the George C. Reifel Migratory Bird Sanctuary, on Westham Island's northwestern tip (PMV 2015).

Ducks and geese remain an important winter food and source of feathers, used for ceremonial purposes. Tsawwassen report the number of hunters has diminished and along with it the opportunities for transference of knowledge to youth (PMV 2015).

Tsawwassen explain deer and bear were once hunted from Point Roberts through Tsawwassen to Burns Bog, as well as on the Gulf Islands. Members had traplines for muskrat, otters, beaver, raccoon and rabbits from present-day Tsawwassen First Nation Lands to Westham Island. Currently, they pursue large game (e.g., deer and elk), in areas far removed from their Lands. Although they did not report current hunting or trapping of small animals, they did note there are fewer reporting requirements for small game harvesting than for other species, and thus some degree of harvesting is probable (PMV 2015).

Gathering

The TFNFA defines “plants” as all flora and fungi but does not include aquatic plants (see “Fishing” section, above) or trees except for their bark, branches and roots. Like other rights under the TFNFA, the First Nation’s right to harvest plants for domestic purposes includes the right to trade or barter plants among themselves or with other Aboriginal people resident in BC, as well as to exchange regalia or traditional or artistic objects made of plants among themselves or with other Coast Salish people for ceremonial purposes (TFN et al. 2009a, Chapter 13).

There are four Tsawwassen Plant Gathering Areas designated under the TFNFA (TFN et al. 2009b, Appendix M-1 and Appendix M-2). Two of these areas are located considerably north of the Project area, in Golden Ears Provincial Park and Pinecone Burke Provincial Park, at the northern extent of Tsawwassen Territory. The other two areas are located near the Project:

- the South Arm Marshes Wildlife Management Area, immediately downstream of the Highway 99 Fraser River crossing; and
- Provincial Crown Land within the Burns Bog Ecological Conservancy Area, north of the easternmost extent of the Project footprint.

Specific species harvested in these areas are not identified in the TFNFA; however, plant species and timber resources in the Project area include *quxmin*, salal, bog blueberries, Indian hemp, cattails and rushes, St. John’s wort, western red cedar, Douglas fir, western hemlock, western yew, black cottonwood, red-osier dogwood, and red alder (TFN 2015). Other plant species identified as important by Tsawwassen Elders or resource users include wild berries (e.g. blackberries, huckleberries, salmonberries, strawberries, snowberries, boysenberries, loganberries, raspberries, black caps, red caps), cherries, crabapples, wild onion, wild mint, rhubarb, Labrador tea, wild rose, thistle, Indian Consumption Plant, yellow or curly dock, devil’s club, ferns, cascara bark, barberry bark, and stinging nettle (PMV 2015a). Traditional timber resources also include cherry, hazelnut, and willow trees; driftwood was also collected from the beach to smoke fish, but no community smokehouses remain (PMV 2015a). Tsawwassen have reported that plants are mainly gathered in and around Tsawwassen First Nation Lands (where still available), and plans are currently underway to resume harvesting in designated areas and to support the transfer of traditional plant use knowledge to Tsawwassen youth (PMV 2015a).

Related Interests

The right to practice the culture of the Tsawwassen First Nation, as well as use of the *Hə́ŋqəmiŋə́m* language, is identified in Chapter 14 of the TFNFA. Several *Hə́ŋqəmiŋə́m* place names for important heritage sites in the vicinity of the Project area are also identified (TFN et al. 2009b, Appendix O-4). These include but are not limited to *ł'eqtinəs* (or *Tl'ektines*), identified in the TFNFA as DgRs-17, which places it slightly upstream of the Project area on the north shore of the South Arm of the Fraser River; and *čičiləx^wqəŋ* (Ladner Landing, DgRs-41) and *X^wlic'əm* (Brunswick Point on Canoe Pass, DgRs-35), both downstream of the Project area.

Tsawwassen emphasize the importance of the Fraser River to their members. In addition to reporting that it is used for transportation, recreation, and cultural purposes (TFN 2015), Tsawwassen have stated: “We are not involved in forestry and mining. If you cut us we bleed fish so any change in any aspect of the Fraser River will be a great concern to us” (MOT 2015). Tsawwassen stress the importance of their continued ability to fish, along with and the significance of fishing and associated activities to their community’s culture and economy (TFN 2015). Some traditional activities, such as spending time with Elders in the smokehouse, no longer occur, as the last smokehouse was demolished when Highway 17 was expanded (PMV 2015a).

Tsawwassen report that disturbance of fish and fish habitat (e.g., sturgeon) as well as water quality are their biggest concerns (MOT 2015). Tsawwassen Elders report changes to the foreshore north and south of their Lands (i.e., “our little beach”), to which they attribute access difficulties, decreases in species abundance, and compromised quality of resources, especially shellfish and crab. Accordingly, they say they have also experienced the loss of important and organic means for community gathering and socializing at this important location (i.e., *sčəwa'əən* and *ča yəm*), both internally and with other nations with whom they have traditionally traded. This has also meant the loss of opportunities to pass down traditions related to the use of the beachfront to their youth (PMV 2015).

Tsawwassen explain that participation in fishing, an integral element of Tsawwassen culture, is decreasing, due to diminishing stocks, increasing harvesting restrictions, and higher costs related to having to travel farther to harvest traditional resources. They identify the lack of a local dock as contributing to higher costs. Currently, Tsawwassen crabbers access preferred harvesting areas around Roberts Bank from Steveston, or from marinas in Ladner and Deas Slough. While public docks are available at the southeastern end of B.C. Ferries Terminal and at Brunswick Point in Canoe Passage, these docks are reportedly very busy, particularly in the summer months (PMV 2015a).

Further, Tsawwassen report that physical access to Fraser River fisheries has changed. Chilukthan Slough, which at one time ran between Roberts Bank and the Fraser River, from north of Tsawwassen First Nation Lands to the Ladner area, was considered Tsawwassen’s “short cut” to the Fraser River; the slough was filled along ago as a result of farm development, and was described as a “huge” loss by Tsawwassen Elders (PMV 2015a). Access to the Fraser River by water now involves a longer route around the existing Roberts Bank terminals and B.C. Ferries Terminal. For canoe journeys, Tsawwassen members must navigate as close as possible to the terminals to and from the river to avoid shipping lanes, large vessel traffic, and shallow waters (PMV 2015a).

Tsawwassen members report that the changes to current flows and sediment build up between the Roberts Bank terminals and causeway to Westham Island are the reason that Canoe Passage, an important fishing area and travel corridor to and from the South Arm of the Fraser River, has become difficult to transit other than at high tide. They report Canoe Passage has become narrower, which means that fewer fishing vessels are able to harvest in the area at any one time (PMV 2015a).

Tsleil-Waututh Nation

Key sources relied upon for this summary are Tsleil-Waututh Nation’s *Knowledge Study*, prepared for the Project (TWN 2015), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Tsleil-Waututh Nation. As part of that ongoing consultation, the Tsleil-Waututh Nation was provided with a draft of this summary and the information that appears in **Section 10.1.1.11** for review and comment. Comments were received from the Tsleil-Waututh Nation and have been incorporated.

The spatial setting in the Tsleil-Waututh’s *Knowledge Study* was defined to include a Study Area that focuses attention on areas that Tsleil-Waututh say may be the most impacted by the Project (TWN 2015), which lies within their Consultaton Area (**Appendix 10-A, Figure 10-10**). The Study Area takes in the North Arm of the Fraser River, extends to the United States border in the south, to Annacis Island in the east, and to the Strait of Georgia, approximately 20 km offshore of Westham Island, in the west. Tsleil-Waututh report that these boundaries were selected to take into consideration the connectivity of adjacent lands, waters, and resources, and to encompass ecosystem characteristics and holistic stewardship values (TWN 2015). Within the Tsleil-Waututh Study Area, use is depicted in terms of buffered points indicating areas of moderate to high use and occupancy, most of which are associated with fishing activities (TWN 2015).

Tsleil-Waututh have previously stated that all the lands and waters draining into Burrard Inlet and Indian Arm constitute their core territory (a subset of their Consultation Area), and that their use of the South Arm of the Fraser River was dependent on kinship ties with other *Hə́ŋqəmiŋəm*-speakers (i.e., Tsawwassen, Musqueam) (PMV 2015). A high degree of use and occupancy has been identified for western and eastern aspects of Deas Slough and Deas Island, and *ł'əqtinəs*, on the north shore of the Fraser River opposite Deas Island. Tsleil-Waututh have identified this location as a Tsleil-Waututh summer fishing village visited by Tsleil-Waututh (TWN 2015). Tsleil-Waututh also reported other high frequency use areas of the Fraser River, including three areas between Westham Island and Lulu Island, an area immediately offshore of Steveston, and the entire stretch of Canoe Passage (TWN 2015). While Tsleil-Waututh continue to access the Fraser River for sockeye, it is not believed the Tsleil-Waututh assert title in or near the Project area.

Fishing

Marine resources were and remain central to Tsleil-Waututh for subsistence and cultural life. Salmon was a food staple, supported by the harvest of the full range of shellfish, including bivalves and crustaceans, sturgeon, a variety of groundfish (e.g., halibut, cod, sole, flounder, lingcod, rockfish, among others), eulachon, herring, and smelt, as well as aquatic plants, such as seaweeds. Seals, porpoises, and sea lions were also harvested. Resources were used immediately, or processed and stored for use in the winter while resident in large villages in and around Burrard Inlet (TWN 2013a), where the present-day community still lives. Tsleil-Waututh have said that access to different species of salmon was important because of their different qualities and requirements for preservation (TWN 2015).

Tsleil-Waututh report they hold a close cultural and spiritual connection to salmon (TWN 2015); however, sockeye salmon do not run in the tributaries of Burrard Inlet. The Tsleil-Waututh Nation has previously reported that their ancestors historically accessed sockeye on the South Arm of the Fraser River through kinship ties, moving to the area in July and August, where they would reside at Tsleil-Waututh seasonal villages with other *Hə́ŋqəmiŋəm*-speaking groups (i.e., Tsawwassen, Musqueam). Historically, they would paddle back to Burrard Inlet village sites with thousands of preserved sockeye from the Fraser River to last throughout the year. Fraser River sockeye remain a primary traditional food source for Tsleil-Waututh families, and salmon, herring, and crab are among the species that still contribute to the contemporary economy of Coast Salish peoples (TWN 2015).

Sturgeon and eulachon were also harvested while resident on the river, which the Tsleil-Waututh also used as a travel corridor (PMV 2015). Tsleil-Waututh report that, historically, billions of eulachon returned to the Fraser River to spawn, providing them with an important

early season fishery. Typically they dried eulachon. Currently, they occasionally receive Fraser River eulachon through relatives and cultural protocols. Sturgeon, due to its decline, is no longer a component of Tseil-Waututh diet. It is their goal to participate in the recovery of these species and their habitats for future generations (TWN 2015).

Tseil-Waututh may fish for FSC purposes under communal licences issued by DFO. PFMA subareas to which these licences apply include 28-11, 28-12, 28-13, 28-14, 29-3, 29-4, 29-6, 29-7, 29-9, 29-10, 29-11, 29-12, 29-13, 29-14, and 29-17 (DFO and TWN 2013). Subareas within PFMA 28 apply to eastern Burrard Inlet and Indian Arm; the other subareas within PFMA 29 cover the Fraser River downstream of the Port Mann Bridge and into the Strait of Georgia (DFO 2016). Subareas 29-13 and 29-14 overlap the Project corridor.

Tseil-Waututh's access to Fraser River salmon extend beyond sockeye and include pink, chum, chinook, and coho (incidental). In addition to communal FSC access, Tseil-Waututh holds 10 to 15 Allocation Transfer Program (ATP) communal commercial fishing licenses. This includes two crab, four to nine herring gill net licenses, one prawn, and three salmon gill net licenses.

In addition to communal licences issued by DFO, Tseil-Waututh report that they may access food fish through other means, such as through cultural protocols and kinship ties with neighbouring communities, when DFO communal licences are unavailable to Tseil-Waututh. Tseil-Waututh advise that they seek to access, protect, and restore traditional foods for future generations, and current and future desired use. For example, Tseil-Waututh report that they have submitted multiple requests to DFO to access Fraser River eulachon – a species traditionally accessed by Tseil-Waututh in the Fraser River – but has been denied an allocation. Tseil-Waututh cautions that DFO communal licence records are therefore not necessarily a comprehensive portrayal of Tseil-Waututh fisheries efforts (TWN 2016).

Tseil-Waututh reports that they have an extensive Fraser River sockeye fishery each year. For the most part, when there are no conservation concerns, Tseil-Waututh says they fulfill their communal allocation. The largest fishing effort occurs in August. Tseil-Waututh has also participated in, and continues to “reserve the right,” to a limited participation fishery for ceremonial purposes outside of the regular Tseil-Waututh sockeye fishing season (TWN 2016).

Tseil-Waututh have advised that, in every year since 2008, they have requested a communal licence for Chinook. With the exception of limited participation access in 2009, 2010, and 2014, Tseil-Waututh Nation has not been granted a DFO communal licence for Chinook. Tseil-Waututh says that they are striving to include Chinook in their Comprehensive Fisheries Agreement (CFA) with DFO, but that DFO continues to manage the Tseil-Waututh allocation of Chinook as a by-catch during other directed fisheries (TWN 2016).

In 2014, Tsleil-Waututh requested communal licences for Fraser River chum. As of 2016, Fraser River chum and pink salmon allocations have been added to Tsleil-Waututh Nation’s CFA (TWN 2016).

Statistics retained by DFO for salmon harvested below the Port Mann Bridge between 2009 and 2015, by First Nation groups other than Musqueam and Tsawwassen, including Tsleil-Waututh, are presented in **Table 10.1-8**.

Table 10.1-8 Below Port Mann Bridge Salmon Catch (kept) for Aboriginal Groups Other Than Tsawwassen and Musqueam, 2009 to 2015

| Species | 2009 | 2010 | 2011 | 2012 | 2013 | 2014 | 2015 |
|---------|------|--------|-------|-------|-------|--------|-------|
| Chinook | 430 | 91 | 126 | 165 | 30 | 141 | 44 |
| Sockeye | 86 | 12,247 | 9,390 | 6,010 | 3,817 | 10,379 | 1,548 |
| Pink | 2 | 0 | 730 | 0 | 0 | 0 | 53 |
| Coho | 0 | 4 | 5 | 2 | 7 | 3 | 4 |
| Chum | 110 | 60 | 89 | 63 | 62 | 30 | 93 |

Source: (DFO 2016)

Tsleil-Waututh also report having access to PFMA 29 for communal crab licences, and have been working with DFO through an access request process to recognize PFMA 29 for prawn and crab communal fisheries in the Tsleil-Waututh Nation’s CFA (TWN 2016)

Fishing is conducted under communal licences on behalf of the community; distributions of fresh fish are made within the community in season and by preserved methods during the winter months. A key objective of the Tsleil-Waututh’s FSC program is to increase access to all seafood species traditionally harvested in Tsleil-Waututh territory (TWN 2013b), an aspiration pursued in parallel with what the Tsleil-Waututh understand as an obligation to restore the lands and waters of the nation’s territory to its “former state,” for the benefit of future Tsleil-Waututh generations (TWN 2013c).

In addition to communal FSC access, Tsleil-Waututh Nation’s 2013 CFA with DFO also provides the nation with communal commercial fisheries access through an allocation transfer program (DFO and TWN 2013). For 2013, eligible allocations were limited to crab taken in Commercial Crab Management Area I (i.e., PFMA 28 and 29, excluding subareas 29-5 and 29-8), prawns caught “coastwide,” herring by gillnet (area not specified, but assumed to be in the “Gulf,” covering Area 14 to 18), and salmon gill net licences for Area D (Area 11 to 15 and 23 to 27) and Area E (Area 16 to 22, 28, 29, and 121).

Tsleil-Waututh participates in commercial fisheries through Salish Seas Limited Partnership, a business owned jointly with the Musqueam Indian Band and Sliammon First Nation. Species harvested commercially through this enterprise include crab (in Crab Management Area I), prawn, halibut, sablefish and herring (PMV 2015).

Hunting / Trapping

Species hunted historically and continuously by Tsleil-Waututh include ungulates, such as deer and elk, bear, ducks, and other waterfowl. The Tsleil-Waututh Nation has previously reported that waterfowl were hunted while resident on the South Arm of the Fraser River in July and August (PMV 2015). Current waterfowl harvesting by Tsleil-Waututh members in or near the Project area was not identified in sources reviewed.

Gathering

On southern Lulu Island, around No. 5 Road, Tsleil-Waututh Nation has stated that it harvested berries, and specifically cranberries, while resident on the Fraser River (TWN 2015). Tsleil-Waututh has also advised that, in 1870, “Sleholdoo, chief of Slilooet (i.e., Sla-holt, chief of Tsleil-Waututh) was a signatory on a petition to colonial authorities opposing the sale of cranberry patches on the Lower Fraser River.” In addition to demonstrating that Tsleil-Waututh utilized these areas for harvesting cranberries, Tsleil-Waututh consider this to be recognition by other signatory First Nations of Tsleil-Waututh’s “rights of utilization” at this location (TWN 2016). Current gathering activities by Tsleil-Waututh members in or near the Project area were not identified in sources reviewed.

Related Interests

Tsleil-Waututh have reported that all areas used for traditional purposes, such as fishing, hunting, and gathering, are regarded as sacred (TWN 2015). They have explained that the landscape utilized for these purposes was shaped, in the very distant past, by the Transformers—or *Xáls*, *Xexá:ls*, or *Khaals*—who began their journey at the Fraser River delta travelling upstream and creating the world (PMV 2015).

Tsleil-Waututh have also explained that waterways within their asserted territory were the principal means of accessing places such as *λ’əqtinəs* (on the north shore of the Fraser River opposite Deas Island); *kwy-yowka* (on the south shore of Lulu Island), and *ʔələqsən* (on the northern end of Westham Island) within the seasonal round of land and resource use. Tsleil-Waututh report two historic canoe routes connecting Roberts Bank to Boundary Bay, Canoe Passage, the South Arm of the Fraser River, and Sturgeon Bank, and two fishing villages, one opposite Deas Island in the Fraser River (associated with *λ’əqtinəs*) and the other at Cannery Point, on the southeastern corner of Point Roberts peninsula (PMV 2015).

Tsleil-Waututh has advised that, in 1867, “Slehortle of Slewet Burrard Inlet Villages” (i.e., Slaholt, chief of Tsleil-Wauuth)...was a signatory of a petition opposing restriction on First Nations travel on the Fraser River.” In addition to demonstrating that Tsleil-Waututh travelled the Fraser River, Tsleil-Waututh consider this to be recognition by other signatory First Nations of Tsleil-Waututh’s “right of unrestricted travel” within this waterway (TWN 2016).

Hwlitsum

Key sources relied upon for this summary are *The Hwlitsum First Nation’s Traditional Use and Occupation of the area now known as British Columbia* (HFN 2016), regulatory documents for other projects in close proximity to the Project area (e.g., PMV 2015), and ongoing consultation between the Ministry and Hwlitsum. As part of that ongoing consultation, Hwlitsum was provided with a draft of this summary and the information that appears in **Section 10.1.1.2** for review and comment. Comments were received from Hwlitsum and have been incorporated, where appropriate.

The Project is located within Hwlitsum territory (**Appendix 10-A, Figure 10-3**), upstream of Hwlitsum’s current and traditional year-round residence at Canoe Pass and downstream of *Tl’uqtinus*, along the Fraser River in the vicinity of the north end of the George Massey Tunnel. Hwlitsum report that *Tl’uqtinus* was a home base occupied and used exclusively by the Cowichan Nation, of which the Hwlitsum consider themselves to be descendants (HFN 2016a). Hwlitsum have stressed, however, that they are independent of the Cowichan Nation community and consult on their own behalf as a First Nation, and that they have been recognized as such by various levels of government and government entities, including the BC Treaty Commission (HFN 2016b).

Fishing

Like other members of the Cowichan Nation, Hwlitsum followed a seasonal round of resource use and regional settlement that involved spending winter on the Gulf Islands and southern part of Vancouver Island (December to February) and summer on the Lower Mainland (March to November) (HFN 2016a).

Hwlitsum began living year-round at Canoe Pass, reported as the centre of Hwlitsum fishing, after 1863, when the Lamalchi winter settlement on Kuper Island was bombed and burned by the Royal Navy (BC and PMV 2012; PMV 2015). While part of their salmon fishing season was also spent at *Tl’uqtinus* (BC and PMV 2012), all species of salmon, cutthroat, Dolly Varden, dogfish, flounder, steelhead, smelt oysters, crab, sturgeon, eulachon, and trout are or have been obtained by Hwlitsum at Canoe Pass or at nearby locations, such as Kirkland Island (salmon), Cohilakthan Slough (steelhead and salmon), Steveston (eulachon, up to the Highway

99 crossing), Ladner Reach (crab), and Roberts Bank (crab and sockeye) (HFN 2016a; PMV 2015). Salmon, steelhead, trout, and sturgeon were also taken further up the Fraser River and its tributaries. Areas within the wider Fraser River estuary were also reportedly utilized by Hwlitsum for fishing salmon, sturgeon, groundfish, and other marine resources (e.g., Tsawwassen, Point Roberts, Boundary Bay) (HFN 2016a).

Hwlitsum have said that access to and use of Fraser River resources has and remains aided by physical presence, including “a set of houses, two wharves and two net sheds” on or near Canoe Pass, as well as through kinship ties with other First Nations (HFN 2016a); however, other sources suggest that Hwlitsum do not currently have a communal licence to fish in the Fraser River for food, social and ceremonial (FSC) purposes, and that their access to their FSC allocation must be gained through negotiations with First Nations with a communal licence (Cohen Commission 2011).

Hwlitsum harvest crab and bivalve species such as clams (i.e., butter, manila, and littleneck), cockles, mussels, oysters, and abalone in the Gulf Islands. Shrimp are generally harvested throughout the Strait of Georgia (between the Gulf Islands and the Lower Mainland), as well as immediately west of the existing Roberts Bank terminals, with targeted shrimp harvesting at Sturgeon Bank. Other marine invertebrates taken include red and green sea urchin, octopus, squid and sea cucumber, all harvested on the western side of the Strait of Georgia (PMV 2015).

Hunting / Trapping

Hwlitsum have hunted at “Canoe Pass and all along the Fraser River as far up as Hope and Yale” (HFN 2016a). Species harvested by Hwlitsum in the vicinity of the South Arm of the Fraser River have included seal, otter, muskrat (Westham Island), black duck, mallard, widgeon, geese (snow, Canada), brant, pintail, pigeon, pheasant (Ladner Reach), and red fox; at Burns Bog, deer, and black bear have been taken. Many of these species continue to be harvested by Hwlitsum members in these areas and others on the Lower Mainland (e.g., waterfowl at Steveston and Boundary Bay, sandpiper at Roberts Bank), as well as on southeast Vancouver Island and the Gulf Islands (e.g., Valdes, Gabriola, Galiano) (BC and PMV 2012, HFN 2016).

Gathering

Hwlitsum have said they gathered up to 20 plant species from areas throughout their traditional round for food, medicinal, and other purposes. While some plants are no longer harvested, plants said to be currently utilized in the area of Canoe Pass include cattails, rhubarb, crab apple, and plums. Ferns and alder (for firewood and smoking salmon) have been reported as collected at Burns Bog (HFN 2016a), with cottonwood having been gathered in the area of

Tl'uqtinus (TMPL 2014). Hwlitsum have identified a preference for alder over cottonwood for smoking salmon, but have switched to the latter due to a reported unavailability of alder in the last few years. Hwlitsum also report harvesting marine plants, such as kelp, seaweed, and rockweed, from the Gulf Islands (PMV 2015).

Related Interests

Hwlitsum have explained that accessibility and availability of healthy local species for harvest within their traditional territory is important for food security as well as ritual and spiritual practices that are the foundation of their people. These local species are regarded as their ancestors, and the resources found within their asserted territory are what bind them to that landscape. Hwlitsum have said that fish habitat has shrunk or disappeared. Hwlitsum have also said that urbanization and cumulative effects of marine development in the area has contributed to diminished use of terrestrial resources (HFN 2016b, PMV 2015).

Hwlitsum report that these changes in resources and their use have disrupted community life and gatherings. For example, because they are no longer able to access eulachon, families no longer gather annually in the old houses and wharf at Canoe Pass to harvest, process, and distribute eulachon. This is said to be the case for other resources as well, particularly at preferred locations that have spiritual, economic, and ritual importance, and to which their oral traditions are tied. Hwlitsum have explained that changes in resources diminish their community's capacity to act collectively (HFN 2016a, PMV 2015), and that without fishing, hunting, and gathering – practices that Hwlitsum have exercised since time immemorial and that are central and integral to Hwlitsum identify – they will be unable to continue to pass on the teachings of generations of their ancestors (HFN 2016b).

10.1.3.3 Potential Effects

This section describes the potential adverse effects of the proposed Project on the exercise of Aboriginal Interests during Project construction and operation, as identified by Schedule B Aboriginal Groups to the Ministry during consultation on the Project or as derived from public sources. Aboriginal Interests identified in relation to all or portions of the Project area are listed in **Table 10.1-9**.

Table 10.1-9 Aboriginal Interests Identified by Schedule B Aboriginal Groups or in Other Sources as Potentially Affected by the Project

| Aboriginal Group | Aboriginal Interests Identified as Potentially Affected by the Project |
|----------------------------|---|
| Cowichan Tribes | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>Tl'uq̓tinus</i>) |
| Halalt First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>Tl'uq̓tinus</i>) |
| Hwlitsum | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title |
| Katzie First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title |
| Kwantlen First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title |
| Lake Cowichan First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title |
| Lyackson First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>Tl'uq̓tinus</i>) |
| Musqueam Indian Band | Proven Aboriginal Right to Fish (FSC) |
| | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>λ'eq̓tines</i>) |
| Penelakut Tribe | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>Tl'uq̓tinus</i>) |
| Semiahmoo First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title |
| Squamish Nation | Asserted Aboriginal Rights |
| Stz'uminus First Nation | Asserted Aboriginal Rights |
| | Asserted Aboriginal Title (including specifically to <i>Tl'uq̓tinus</i>) |
| Tsawwassen First Nation | Tsawwassen First Nation Fishing Right |
| | Tsawwassen First Nation Right to Harvest Migratory Birds |
| | Tsawwassen First Nation Right to Harvest Wildlife |
| | Tsawwassen First Nation Right to Gather Plants |
| | Tsawwassen First Nation Right to Practice Tsawwassen First Nation Culture |
| Tseil-Waututh Nation | Asserted Aboriginal Rights |

The assessment of potential Project-related effects on the exercise of Aboriginal Interests identified above is informed by the information provided in **Section 10.1.3.2** regarding past, present, and desired future use of the Project area by each Schedule B Aboriginal Group, and the findings of the assessments for ICs or VCs linked or interrelated with the exercise of Aboriginal Interests (as listed in **Section 10.1.3.1**), including consideration of any cumulative effects and follow-up measures identified in those Part B assessments, as per the methodology outlined in **Section 3.10 Cumulative Effects Assessment** and **Section 3.11 Follow Up Strategy**.

Based on the information provided in **Section 10.1.3.2** regarding past, present, and desired future use and ongoing consultation between the Ministry and Aboriginal Groups, potential incremental Project-related interactions and effects may be experienced by those Aboriginal Groups across the four indicators identified in **Section 10.1.3.1**, namely:

- Access to preferred locations for the exercise of Aboriginal Interests;
- Availability of preferred resources for the exercise of Aboriginal Interests;
- Quality of preferred resources for the exercise of Aboriginal Interests; and
- Quality of experience in exercising, or tied to the exercise of, Aboriginal Interests.

The analysis of potential changes associated with each of these four indicators during Project construction and operation is examined in the sections below in **Section 10.1.3.3.1** through **Section 10.1.3.3.4**. As indicated in those sections, not all potential changes may be experienced by all Schedule B Aboriginal Groups or in the same way. For example, some Aboriginal Groups may be expected to experience no effect or a negligible effect, while for others, the potential change may be anticipated to be measurable. For the purposes of this assessment, no effect was understood to mean that no interaction between Project components or activities and preferred locations or preferred resources for the exercise of Aboriginal Interests would be expected, while the following definitions were used to guide the characterization of an effect as negligible or measurable:

- Negligible – An interaction between Project components or activities and preferred locations or preferred resources for the exercise of Aboriginal Interests may occur, but modifications to the use of preferred options would not be expected.
- Measurable – Modifications to the exercise of Aboriginal Interests at preferred locations or in relation to preferred resources may be needed, and may be minor (minimal or temporary modifications may be required to use preferred options), moderate (more frequent or longer term modifications may be required to use preferred options), or serious (permanent or indefinite modifications may be required potentially resulting in the loss of preferred options).

In **Section 10.1.3.3.1** through **Section 10.1.3.3.4** below, potential changes in access to preferred locations for the exercise of Aboriginal Interests, in the availability or quality of preferred resources for the exercise of Aboriginal Interests, or in the quality of experience in exercising, or tied to the exercise of, Aboriginal Interests are analyzed in terms of the type and level of effect that Project components and activities may be expected to have on the exercise of Aboriginal Interests by Schedule B Aboriginal Groups in general. For a detailed breakdown of the type and level of effect that Project components and activities may be expected to have on the exercise of Aboriginal Interests for each Schedule B Aboriginal Group, see **Section 10.1.3.8 Summary of the Aboriginal Interests Assessment by Aboriginal Group**.

10.1.3.3.1 Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

As reviewed in **Section 10.1.3.2**, locations in or near the Project area linked to the exercise of Aboriginal Interests were identified by all Schedule B Aboriginal Groups. Project components and activities, as described in detail in **Section 1.1 Description of Proposed Project**, have the potential to interact with and adversely affect access to or patterns of use between traditional use locations identified by Aboriginal Groups that are or may be associated with the exercise of Aboriginal Interests. Specifically, three potential effects pathways on access have been identified, as follows:

- Potential changes in river hydraulics and morphology during and as a result of Tunnel removal could affect access to or use of preferred locations on the river for the exercise of Aboriginal Interests, such as fishing or other harvesting activities, if hydraulic or morphological effects altered the physical characteristics of these locations in a way that reduced or eliminated the ability to harvest at those locations.
- Potential changes in access to locations for the exercise of Aboriginal Interests (e.g., fishing, hunting/trapping, gathering, and related interests, such as cultural sites and transportation routes) may result from instream and upland Project construction activities that overlap locations associated with the exercise of Aboriginal Interests (see **Section 5.2 Marine Use, Table 5.2-6 Species Run Timings and Aboriginal and Commercial Fisheries Openings (in Number of Hours) in the Lower Fraser River** for an example of potential timing conflicts with Aboriginal fisheries).
- Potential changes in access to locations for the exercise of Aboriginal Interests may also result from footprint effects during Project operation.

Some of the specific concerns related to access raised by Aboriginal Groups during consultation with the Ministry included:

- Past and ongoing effects of the original highway and Tunnel construction on former access to and use of sloughs, creeks, and upland areas along the corridor;
- Past and ongoing effects of natural and anthropogenic changes on Fraser River access and use, including but not limited to closing off of side-channels and sloughs, alteration of shoreline, and ongoing dredging;
- Potential interference or displacement of fishing (e.g., gillnetting, which can occur daily), foreshore harvesting activities, and the ability to access the area from local marinas and boat launches as a result of marine traffic closures or obstructions related to Project activities;
- Potential Tunnel removal effects on existing fishing conditions related to river dynamics, to which fishers have become adapted, both upstream (e.g., Tilbury Island area) and downstream of the Tunnel (e.g., Duck, Barber, and Woodward Island complexes);
- Potential Tunnel removal effects to the river floor (i.e., creation of divets), river habitat, and ability to drop nets in preferred fishing spots (e.g., directly over the Tunnel);
- Potential Tunnel removal effects to shorelines, tidal wetlands, mudflats, drainage channel, and uplands of the South Arm Marshes Wildlife Management Area, downstream of the Highway 99 crossing, where plant harvesting occurs;
- Potential access effects due to the timing and duration of Tunnel removal, particularly in relation to specific runs (e.g., salmon, eulachon) and number of affected fishing seasons;
- Potential economic losses that could result from fishing access issues;
- Potential footprint effects on river foreshore and upland access as a result of Project component placement in upland areas that are currently accessible; and
- Ongoing effects on access as a result of increases in marine traffic volumes on the river, particularly as this relates to larger ships, which the Tunnel removal is perceived as facilitating.

Linked or Interrelated IC and VC Assessment Considerations

The IC and VC assessments presented in Part B of the Application were reviewed for relevance to the assessment of potential Project-related effects on access to locations for the exercise of Aboriginal Interests, and specifically **Section 4.1 River Hydraulics and River Morphology**, **Section 5.2 Marine Use**, **Section 5.3 Land Use**, and **Section 6.1 Heritage Resources**. The findings of these assessments are summarized in turn below.

As discussed in **Section 4.1 River Hydraulics and River Morphology**, potential Project-related changes as a result of Tunnel decommissioning (removal and post-removal) on Fraser River suspended sediment loads, current velocities, water levels, flow splits (i.e., into Ladner Reach and Canoe Pass), and morphology of the riverbed were assessed.

The Project has been designed with a clear-span crossing of the Fraser River South Arm, which avoids the potential for long-term effects on the hydraulics and morphology of the river. Potential Project-related effects are limited to those associated with Tunnel decommissioning and no long-term residual effects are expected after one to two freshets following Tunnel decommissioning.

Removal of Tunnel segments and overlying material has the potential to result in a temporary increase in suspended sediment volumes within and adjacent to the Tunnel alignment. Implementation of best practices and proven sediment control measures are expected to minimize such effects; however, a temporary increase in suspended sediment volume could persist in this area during and immediately following Tunnel removal activities. Following Tunnel decommissioning, a temporary lowering of the riverbed is expected to persist for one to two freshets between the Tunnel location and the Lulu Island-Delta watermain, owned by Metro Vancouver and located approximately 600m downstream. These construction-related adverse residual effects are considered to be of low magnitude in the context of relatively high turbidity of the river and dynamic riverbed conditions, which includes migrating sand dunes that are several metres high. The effects will be local in extent and short-term in duration, with an uncommon or occasional frequency. All potential effects are expected to be temporary and fully reversible. Construction-related changes in sediment volumes and temporary bed lowering are not expected to overlap temporally or spatially with similar effects of other projects or activities and result in cumulative effects.

Potential effects of the temporary change in river bed profile on the Lulu Island-Delta water main will be addressed through ongoing engagement and coordination with Metro Vancouver, and implementation of a monitoring and mitigation plan to be developed in conjunction with Metro Vancouver. Erosion and Sediment Control plans, developed as part of the CEMP, will be implemented during Tunnel removal to ensure potential effects on fish from elevated TSS levels or induced turbidity are avoided.

As identified in **Section 5.2 Marine Use**, the Project has been designed with a clear-span bridge across the Fraser River South Arm and Deas Slough, in a manner that avoids any potential impact on navigation, and no long-term residual effects on marine use are expected post-construction (see **Appendix 16.1 Reference Concept** for the proposed design of the new bridge).

During construction of the new bridge, specifically, component placement, and decommissioning of the Tunnel, the Project has the potential to temporarily affect marine navigation or other uses (including CRA fisheries) on the water in the vicinity of the crossing, where these activities and marine use overlap. Although such changes are expected to be minimized through the development and implementation of a Marine Access Management Plan, some effects are likely to persist during marine-based construction activities. These construction-related adverse residual effects are considered to be of low to moderate magnitude as access to the Fraser River South Arm will be maintained at all times during construction, with some restrictions such as tug assistance. Effects will be local, confined to the Fraser River South Arm, 2.5 km downstream and 5 km upstream of the Tunnel, and Deas Slough. Any effect on marine use will be short-term, limited to temporary increase in volume and frequency of marine traffic and occasional change in marine access during construction activities requiring marine-based vessels or equipment. All potential effects are expected to be temporary and fully reversible. Construction-related change in marine use is not expected to overlap temporally or spatially with similar effects of other projects or activities and result in cumulative effects.

To address potential Project-related effects during marine-based construction, a Marine Access Management Plan will be developed and implemented and will include communications protocols to establish and advise marine users of instream construction activities. Formation of a Marine Users Group, is proposed to support the development and implementation of the Marine Access Management Plan. This group would meet regularly over the course of construction to identify potential interactions and procedures for avoiding, reducing, or otherwise managing potential interactions. The Ministry is working with Aboriginal Groups to determine their preferences with respect to consultation on the development and implementation of the Marine Access Management Plan. The Ministry will work with Aboriginal Groups to identify potential interactions and procedures for avoiding, reducing or managing potential interactions with Aboriginal marine users.

(see **Section 5.2 Marine Use** for further details).

With regard to land access, **Section 5.3 Land Use** considered the Project's consistency with existing land use plans and designations and compatibility with adjacent land uses, as well as potential Project-related changes in area of existing land uses, disturbance to residential, commercial, and industrial land uses, disturbance to recreational uses near the new bridge, and change in regional growth patterns. Mitigation measures proposed by the land use assessment for potential effects include a combination of avoidance through Project design (i.e., largely keeping to within the right-of-way) and minimization of land user access effects during construction through incorporation of land use considerations into a Construction Traffic

Management Plan and incorporation of marine use considerations (regarding marine access from land-based facilities) into a Marine Access Management Plan, as identified in **Section 5.2 Marine Use**. In addition to the communications component of the Marine Access Management Plan identified in **Section 5.2 Marine Use**, **Section 5.3 Land Use** also identifies a communication component to the Construction Traffic Management Plan as a way for land users to identify priorities for timing, location, and options for access, as well as provision for the reconnection of trails (i.e., Island Tip Trail on Deas Island and Millennium Trail) that will be affected during construction. However, even with implementation of mitigation measures, construction activities in the Project alignment will likely result in some disturbance to adjacent land uses, primarily due to changes in access. With the majority of the LAA used for agriculture or having low-density development, only a limited number of land uses will be directly affected by construction activities. Shore-based marina facilities in Deas Slough may require temporary changes in scheduling. Access to recreational uses in certain areas may also need to be periodically restricted for short periods to protect the safety of users. Changes in land use are not readily distinguished from existing conditions, or such changes in use may be accommodated with minor changes in timing of activities. Recreational users will still be able to use areas outside of the restricted area, and restrictions will likely affect a relatively small number of users for a short period of time. The magnitude of construction-related residual effects is, therefore, considered low to moderate. The effects will be local in extent, frequent in terms of timing and short-term in duration, and are reversible.

The land use assessment predicts that residual effects to land users will be not significant. Project-related residual effects are reversible once construction is completed, and are therefore not considered likely to overlap with, and interact cumulatively with similar effects of other projects and activities.

Section 6.1 Heritage Resources notes that, while there are 14 recorded archaeological sites near the Project area (refer to **Figure 6.1-4**), Project-related effects to historical or archaeological heritage sites within the Project area are not expected, as no sites were identified in the course of fieldwork; however, an Archaeological and Heritage Resources Management Plan, including a chance-find procedure, and additional archaeological surveys to visit areas that were partially inaccessible during the field inventory (see **Figure 6.1-2**) are proposed. With regard to cultural sites that may not always coincide with locations that exhibit archaeological or historical material or features, including but not limited to spiritual sites and transportation routes, see the discussion in **Section 10.1.3.3.4**.

Summary of Potential Changes in Access to Locations for the Exercise of Aboriginal Interests

Potential changes in access to locations for the exercise of Aboriginal Interests by Schedule B Aboriginal Groups (as identified in **Section 10.1.3.2**) as a result of changes in river hydraulics or morphology are expected to be negligible (i.e., undetectable or unmeasurable) before additional mitigation for all Schedule B Aboriginal Groups, as it is not anticipated that Tunnel removal would result in measurable effects on the physical characteristics of preferred traditional use locations upstream or downstream of the crossing in a way that would reduce or eliminate the ability to access or use those locations in the way they are currently accessed and used at present or in the future.

Potential changes in access to instream locations for the exercise of Aboriginal Interests by Schedule B Aboriginal Groups (as identified in **Section 10.1.3.2**) during Project operation are also expected to be negligible before additional mitigation for all Schedule B Aboriginal Groups, as the bridge is designed to be clear span (i.e., no instream footprint).

Potential changes in access to upland locations for the exercise of Aboriginal Interests by Schedule B Aboriginal Groups (as identified in **Section 10.1.3.2**) resulting from Project footprint effects during operation are expected to be negligible before additional mitigation for all Schedule B Aboriginal Groups, as the footprint area required by bridge components and interchanges is expected to fall primarily within the existing Highway 99 right of way and is not expected to overlap with upland locations associated with the exercise of Aboriginal Interests (including but not limited to known archaeological, historical, or cultural sites, such as *λ'eqtines* or *Tl'uqtinus*, among other variations).

Potential changes in access to locations for the exercise of Aboriginal Interests by Schedule B Aboriginal Groups (as identified in **Section 10.1.3.2**) resulting from the overlap of instream construction activities and the exercise of Aboriginal Interests (e.g., fishing), should this overlap occur, are expected to be episodic and of short duration. Before mitigation, incremental Project construction-related effects on access to locations for the exercise of Aboriginal Interests could therefore be potentially disruptive (and therefore potentially measurable) for Schedule B Aboriginal Groups that have identified use of locations that may be subject to access interference or displacement as a result of instream Project construction activities.

Based on the information described in **Section 10.1.3.2** regarding past, present, and desired future use, it is expected these access effects could be experienced by all Schedule B Aboriginal Groups, but it is expected that these effects would be negligible for these groups except Musqueam Indian Band and Tsawwassen First Nation, given current reported access levels of these two groups relative to other Schedule B Aboriginal Groups in the South Arm of

the Fraser River. While it is acknowledged that other Schedule B Aboriginal Groups have reported a desire for higher levels of use in this portion of the river based on historic use, the episodic and short-term access effects that are anticipated as a result of instream Project-related construction activities are not expected to measurably affect their current or desired future use.

Project design considerations and other measures identified in **Section 5.2 Marine Use** and **Section 5.3 Land Use** intended to avoid, reduce, or otherwise manage incremental access effects on use as a result of instream Project construction activities, including but not limited to participation (where desired) in a marine users group as part of the Marine Access Management Plan, are expected to largely address the incremental Project-related effects on access to locations for the exercise of Aboriginal Interests during construction that may be experienced by Musqueam Indian Band, Tsawwassen First Nation, and potentially other Schedule B Aboriginal Groups, should these Aboriginal Groups wish to participate in a marine users group or other consultation mechanisms involving other marine or land users. To specifically address potential effects on access to locations for the exercise of Aboriginal Interests, additional and separate consultative measures are identified below in **Section 10.1.3.4**.

10.1.3.3.2 Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

As reviewed in **Section 10.1.3.2**, resources that occur in or transit through the Project area and that are linked to the exercise of Aboriginal Interests were identified by all Schedule B Aboriginal Groups.

Project components and activities, as described in detail in **Section 1.1 Description of Proposed Project**, have the potential to interact with and adversely affect the availability of resources associated with the exercise of Aboriginal Interests by changing species abundance or habitat, or by causing sensory disturbance, changes in behavior, or harm (physical injury or mortality) to fish (and fish habitat), marine mammals, terrestrial wildlife, or vegetation.

Some of the specific concerns regarding availability of resources raised by Aboriginal Groups during consultation with the Ministry included:

- Past and ongoing effects on fish habitat from river dredging;
- Past and ongoing effects on species availability and the ability to secure enough fish (e.g., salmon, eulachon, sturgeon) for a range of purposes (e.g., food, economic, health, social, and ceremonial), particularly when needs are anticipated to increase;
- Potential fish mortality from construction activities (e.g., pile driving, blasting);

- Potential Tunnel removal effects (e.g., water flow rates, sediment transport/concentrations) on salmon and eulachon runs and on sturgeon, which are year-round residents;
- Potential noise and vibration effects from construction activities on fish and marine mammals;
- Potential noise effects on eagles (a culturally important species) and their nesting areas, as well as ducks and other waterfowl;
- Potential light or other disturbance effects from the bridge on birds, fish, and wildlife (e.g., Deas Island a rare area of refuge for wildlife in the area);
- Potential bird and bat strikes with the new bridge; and
- Potential loss of native vegetation (e.g., cattail marsh, berries and rushes) and introduction of invasive species.

Linked or Interrelated IC and VC Assessment Considerations

The assessments presented in Part B of the Application were reviewed for relevance to the assessment of potential Project-related effects on access to locations for the exercise of Aboriginal Interests, and specifically **Section 4.4 Fish and Fish Habitat**, **Section 4.6 Marine Mammals**, **Section 4.7 Vegetation** and **Section 4.8 Terrestrial Wildlife**. The results of these assessments are summarized below according to the Aboriginal Interest with which they are most closely associated (i.e., fishing, hunting/trapping, gathering).

Fishing

Section 4.4 Fish and Fish Habitat examined potential Project-related effects to fish or changes in fish habitat quality or quantity. The assessment focused on species of CRA value or conservation concern, namely: (1) salmon (Chinook, chum, coho, pink, sockeye); (2) sturgeon (green, white); (3) eulachon; (4) trout (coastal cutthroat, rainbow steelhead); and (5) char (Dolly Varden, bull trout). Measures to address identified Project-related effects to fish include Project siting and design (e.g., limiting work to within the right of way, use of a clear-span bridge over the Fraser River); a Fish and Fish Habitat Management Plan within the CEMP and OEMP (which will consider least-risk timing windows, underwater noise, and turbidity/TSS levels) and an Erosion and Sediment Control Plan (also included within the CEMP and OEMP); habitat enhancement at Green Slough and Deas Slough; and habitat offsetting for habitat loss through a Fish Habitat Offsetting Plan. These measures are expected to be largely effective at addressing potential Project-related effects; however, a residual effect from crushing or entrainment of fish resulting in physical injury or direct mortality could occur as a result of Project construction activities. The effect, which is considered of low likelihood (or unlikely) to

occur, is determined to be not significant, as it is not expected to affect the population integrity of any of the fish sub-components. No cumulative effects are anticipated. Monitoring will be conducted to ensure mitigation measures identified in **Section 4.4** are implemented and expected outcomes, in terms of avoiding or minimizing potential Project-related adverse effects to fish and fish habitat, are achieved.

Hunting/Trapping

Underwater noise generated during Project construction activities was assessed in **Section 4.6 Marine Mammals** for potential effects on marine mammals, and specifically in relation to harbour seals. Project operation activities are not anticipated to generate underwater noise, and are therefore not expected to result in adverse effects on marine mammals. Mitigation measures related to Project-construction underwater noise effects on harbour seals (Marine Mammal Management Plan of the CEMP and underwater noise monitoring) are expected to prevent physical injury and minimize the potential for behavioural disturbance of marine mammals. No residual Project-related effects are anticipated, and the Project is not expected to contribute to cumulative effects on marine mammals; however, with regard to sea lions, the Ministry will work with DFO as required to determine the potential need for monitoring and follow-up programs to ensure that the measures identified in **Section 4.6** are also effective at avoiding or minimizing Project-related effects on sea lions.

As indicated in **Section 4.8 Terrestrial Wildlife**, Project-related activities could lead to terrestrial wildlife habitat loss, habitat alteration (as a result of sensory disturbance from noise or changes in water quality), and/or mortality during construction and operation. Focal wildlife species identified for the assessment include upland birds (e.g., great blue heron, barn owl, olive-sided flycatcher, common nighthawk, barn swallow, and bald eagle), riverine birds (i.e., double-crested cormorant, crackling goose, tundra swan, Caspian tern, and western grebe), and small mammals (i.e., three species of shrew and southern red-backed vole). Mitigation measures identified in the wildlife assessment to address potential Project construction or operation effects include Project siting and design considerations; best management practices and environmental management plans within the CEMP and OEMP, including provisions of the Terrestrial Vegetation and Wildlife Management Plan (e.g., timing windows, pre-construction surveys, salvage and relocation), Erosion and Sediment Control Plan, and Fish and Fish Habitat Management Plan; habitat enhancement, and habitat offsetting. After the implementation of mitigation, residual effects are expected to include habitat loss for upland birds (i.e., barn swallow nesting habitat) during Project construction and direct mortality to barn owl during Project operation; however, these residual effects are considered not significant, as affected wildlife are expected to remain self-sustaining in the assessment area.

They are also considered of low likelihood to occur, and no cumulative effects are anticipated. Monitoring will be conducted to ensure mitigation measures identified in **Section 4.8** are implemented and expected outcomes in terms of avoiding or minimizing effects on terrestrial wildlife, specifically barn swallow and barn owl, are achieved.

Gathering

Section 4.7 Vegetation identifies the potential for both temporary effects on at-risk ecosystems (i.e., cattail marsh) in the Project area as a result of construction activities, as well as permanent footprint effects from the installation of some Project components. Project operation is not expected to affect at-risk ecosystems.

Project-related effects on vegetation that cannot be avoided through Project design and implementation considerations, such as the loss of cattail marsh adjacent to River Road and Green Slough due to unavoidable footprint effects, are expected to be fully addressed through a Terrestrial Vegetation and Wildlife Plan and Invasive Species Management Plan within the CEMP, habitat enhancement, and habitat offsetting measures.

As the Project is not expected to result in residual effects on vegetation, the Project is therefore not anticipated to contribute to cumulative effects on at-risk ecosystems. Monitoring will be conducted during and after construction to ensure mitigation measures identified in **Section 4.7** are implemented and expected outcomes in terms of avoiding or minimizing effects on vegetation, specifically at-risk ecosystems, are achieved. Post-construction monitoring will focus on the progress of the functioning of the habitat created to offset potential footprint effects on at-risk ecosystems (i.e., cattail marsh).

Summary of Potential Changes in Availability of Resources for the Exercise of Aboriginal Interests

Mitigation measures identified in the fish and fish habitat assessment to address Project-related effects on fish sub-components are expected to also be effective at avoiding, reducing, or otherwise managing potential effects on the availability of resources for the exercise of Aboriginal Interests related to fishing. Further, as residual effects on fish identified in the fish and fish habitat assessment are not anticipated to affect the population integrity of any of the fish sub-components, potential residual effects as a result of Project construction activities, were they to occur, would not be expected to measurably affect the availability of fish resources for the exercise of Aboriginal Interests associated with those resources. Project construction or operation activities would not therefore be expected to measurably affect, incrementally or cumulatively, the availability of fish resources for the exercise of Aboriginal Interests associated with those resources.

Mitigation measures identified in the marine mammal and terrestrial wildlife assessments to address Project-related effects on marine mammals and terrestrial wildlife are expected to also be effective at avoiding, reducing, or otherwise managing effects on the availability of resources for the exercise of Aboriginal Interests related to hunting/trapping. Further, residual Project effects on upland birds (i.e., barn swallow, barn owl) identified in the wildlife assessment are not anticipated to affect these birds at the population level. Potential Project-related effects on marine mammals and terrestrial wildlife are therefore not expected to measurably affect, incrementally or cumulatively, the availability of these wildlife resources for the exercise of Aboriginal Interests associated with those resources.

Mitigation measures identified in the vegetation assessment to address Project-related effects on terrestrial vegetation are expected to also be effective at avoiding, reducing, or otherwise managing effects on the availability of resources for the exercise of Aboriginal Interests related to gathering, specifically through offsetting for loss of cattail marsh, revegetation with native plants of traditional importance, and management of invasive species. Project construction or operation activities would not therefore be expected to measurably affect, incrementally or cumulatively, the availability of vegetation resources for the exercise of Aboriginal Interests associated with those resources.

Based on the above, Project-related effects on the exercise of Aboriginal Interests related to potential changes in the availability of resources (i.e., fish and fish habitat, marine mammals, terrestrial wildlife, or vegetation) would be expected to be negligible after the implementation of mitigation identified in Part B of the Application in relation to these resources; however, additional consultative measures to specifically address Aboriginal Group concerns related to potential effects on the availability of resources associated with the exercise of Aboriginal Interests are identified below in **Section 10.1.3.4**.

10.1.3.3.3 Changes in Quality of Preferred Resources for the Exercise of Aboriginal Interests

As reviewed in **Section 10.1.3.2**, resources that occur in or transit through the Project area linked to the exercise of Aboriginal Interests were identified by all Schedule B Aboriginal Groups.

Project components and activities, as described in detail in **Section 1.1 Description of Proposed Project**, have the potential to interact with and adversely affect the quality of resources linked to the exercise of Aboriginal Interests. Potential effects on resource quality could be experienced by traditional users through direct changes to the quality of the physical resource (i.e., water), or indirectly through changes to biological resources (e.g., traditional or “country” foods) that may be affected by changes in water or air quality.

Some of the specific concerns regarding the quality of resources raised by Aboriginal Groups during consultation with the Ministry included:

- Past and ongoing effects of natural and anthropogenic changes on the overall health of the Fraser River and its carrying capacity for further change;
- Potential Tunnel removal effects on the quality of fish (e.g., if driven out from where they are supposed to be by Project construction activities and then return degraded);
- Potential pollution/contamination effects on resources from Tunnel removal or stormwater runoff from bridge;
- Potential human health effects from consumption of polluted/contaminated resources; and
- Potential effects on water quality for certain cultural practices (e.g., bathing and other spiritual activities) as a result of Project activities.

Linked or Interrelated IC and VC Assessment Considerations

The assessments presented in Part B of the Application were reviewed for relevance to the assessment of potential Project-related effects on the quality of resources for the exercise of Aboriginal Interests, and specifically **Section 4.2 Sediment and Water Quality**, **Section 4.4 Fish and Fish Habitat**, **Section 4.6 Marine Mammals**, **Section 4.8 Terrestrial Wildlife**, **Section 4.7 Vegetation**, **Section 4.9 Air Quality**, and **Section 7.1 Human Health**. In addition, key findings of the HIA (Section 7.2) undertaken to support Project planning were used, where appropriate, to support the assessment of potential effects on Aboriginal Interests. The results of these assessments are summarized below.

As discussed in **Section 4.2 Sediment and Water Quality**, the Project has been designed with appropriate stormwater runoff collection and management features that avoid any direct road runoff into the Fraser River, and no residual effects on water or sediment quality are expected post-construction. Implementation of best practices and proven sediment and erosion control measures are expected to avoid any potential effects on water and sediment quality during Project construction; however a minor increase in turbidity and total suspended sediment (TSS) levels could persist in the immediate vicinity of construction activities during Tunnel removal.

This residual effect is considered to be of low magnitude, given the relatively high turbidity of the river and characteristics of bed sediments in the Project area, which are consistent with sediments transported in the Fraser River in general. Effects will be local in extent, short-term in duration, with an uncommon or occasional frequency, and fully reversible. Construction-related increase in turbidity and TSS levels is not expected to overlap temporally or spatially with similar effects of other projects or activities and result in cumulative effects.

Erosion and Sediment Control plans, developed as part of the CEMP, will be implemented during Tunnel removal to ensure potential effects on fish from elevated TSS levels or induced turbidity are avoided. The effectiveness of measures undertaken as part of these plans will be evaluated through monitoring over the construction phase.

Section 4.4 Fish and Fish Habitat indicates that residual effects to fish from exposure to elevated suspended sediment levels are not expected following the implementation of mitigation, including measures outlined in **Section 4.2 Sediment and Water Quality**. For marine mammals, only underwater noise was evaluated for potential Project-related effects on these animals in **Section 4.6 Marine Mammals**; however, given the sediment and water quality and fish and fish habitat assessment results, marine mammal exposure to contaminants as a result of Project-related activities would not be expected.

With regard to terrestrial resources, **Section 4.9 Air Quality** indicates that a qualitative assessment of Project-related changes to air quality during Project construction activities was undertaken, as detailed information on construction equipment will not be confirmed until the final design is complete. However, because potential incremental changes to air quality associated with highway construction are well understood and can be addressed through the application of mitigation measures that have been demonstrated to be effective, residual effects on air quality during construction are expected to be minimal. Specific measures to address construction related effects on air quality will be included in an Air Quality and Dust Control Management Plan within the CEMP. Once the Project is operational, measures for managing vehicle emissions and road dust are expected to contribute to an improvement over existing air quality conditions. While air quality effects on terrestrial resources are not explicitly addressed in **Section 4.7 Vegetation** or **Section 4.8 Terrestrial Wildlife**, effects on these resources as a result of exposure to airborne contaminants are not anticipated given the results of the air quality assessment.

Similarly, while **Section 7.1 Human Health** does not address potential exposure to contaminants through consumption of edible aquatic or terrestrial resources, the uptake of contaminants in edible resources as a result of Project activities would not be expected given

the results of the water quality and air quality assessments. This prediction is supported by the findings of the health impact assessment, undertaken to support Project planning, summarized in **Section 7.2 Health Impact Assessment**.

Summary of Potential Changes in Quality of Resources for the Exercise of Aboriginal Interests

Mitigation measures identified in the assessments of sediment, water, and air quality to address potential Project-related effects are expected to be effective at avoiding, reducing, or otherwise managing effects on the quality of resources for the exercise of Aboriginal Interests related to traditional use of water for cultural purposes and the consumption of edible resources. Potential Project-related effects on the exercise of Aboriginal Interests related to potential changes in the quality of resources would therefore be expected to be negligible after the implementation of mitigation identified in Part B of the Application in relation to these resources; however, additional consultative measures to specifically address Schedule B Aboriginal Group concerns related to potential effects on the quality of resources associated with the exercise of Aboriginal Interests are identified below in **Section 10.1.3.4**.

10.1.3.3.4 Changes in Quality of Experience in Exercising, or Linked to the Exercise of, Aboriginal Interests

As described in **Section 10.1.3.2** and reviewed above in **Section 10.1.3.3.1** through **Section 10.1.3.3.3**, locations and resources that occur in or transit through the Project area and that are linked to the exercise of Aboriginal Interests were identified by all Schedule B Aboriginal Groups. Project components and activities, as described in detail in **Section 1.1 Description of Proposed Project**, have the potential to interact with and adversely affect the the quality of experience in exercising, or tied to the exercise of, Aboriginal Interests in relation to these locations and resources. Two potential pathways for these effects are examined in this section:

- Quality of Experience in Exercising Aboriginal Interests -- Direct sensory disturbance to traditional users (e.g., through Project-related changes in air quality, noise or vibration levels, or visual quality) that do not flow through a biological resource VC (e.g., fish, vegetation, wildlife); and/or
- Quality of Experience Tied to the Exercise of Aboriginal Interests - Indirect changes in cultural practices, customs or traditions – i.e., cultural heritage or the expression and transfer of cultural values or ways of knowing (e.g., language, laws/governance, stories, spiritual beliefs) – as a result of changes in access to or use of locations or the availability or quality of resources.

To the extent that Project components and activities are not expected to result in measurable effects on access to locations or the availability or quality of resources for the exercise of Aboriginal Interests following the implementation of mitigation (as described above in **Section 10.1.3.3.1** through **Section 10.1.3.3.3**), potential indirect effects on the quality of experience or cultural heritage tied to the use of those locations and resources would also not be expected as a result of those indirect pathways; however, as indicated in **Section 10.1.3.3.1**, a potential measurable temporary effect on access as a result of instream construction activities may be expected for Musqueam Indian Band and Tsawwassen First Nation, potentially resulting in a measurable indirect effect on the quality of experience (i.e., cultural heritage) tied to the traditional use of affected river locations could also occur.

Traditional users may experience direct sensory disturbance in the exercise of Aboriginal Interests as a result of Project-related emissions (i.e., air, noise, vibration) and/or as a result of changes in visual quality, which can result in disturbance to the cultural landscape. These potential adverse effects may be experienced independently of potential effects on access to locations or the availability or quality of resources reviewed above in **Section 10.1.3.3.2** and **Section 10.1.3.3.3**. These potential adverse effects on quality of experience are analyzed in turn below.

Disturbance from Potential Changes in Air Quality or Noise or Vibration Levels

As reviewed in **Sections 10.1.3.2** and **Section 10.1.3.3.1**, use of locations in or near the Project Area linked to the exercise of Aboriginal Interests was reported by Schedule B Aboriginal Groups. Traditional users of these locations could be disturbed directly by air, noise, or vibration emissions during Project construction or operation.

Some of the specific concerns regarding the air, noise, and vibration emissions on the exercise of Aboriginal Interests raised by Aboriginal Groups during consultation with the Ministry included:

- Past and ongoing effects of noise increases over time since the highway and Tunnel were built;
- Potential noise effects from increased marine traffic, particularly large vessels, and noise or vibration effects from bridge traffic; and
- Potential noise effects on resources relied upon for the exercise of Aboriginal Interests (see **Section 10.1.3.3.2**, above, for consideration of these potential effects).

Linked or Interrelated IC and VC Assessment Considerations for Potential Changes in Air Quality or Noise and Vibration Levels

The assessments presented in Part B of the Application were reviewed for relevance to the assessment of potential Project-related effects on the exercise of Aboriginal Interests due to potential disturbance from air, noise, or vibration emissions during Project construction or operation, and specifically **Section 4.9 Air Quality**, **Section 4.10 Atmospheric Noise**, **Section 5.3 Land Use**, and **Section 7.1 Human Health**. The results of these assessments are summarized below.

As discussed in **Section 4.9 Air Quality**, Project-related reduction in idling due to congestion and consequent reduction in vehicle emissions is expected to contribute to an improvement in air quality, and no Project-related adverse residual effects on air quality are expected post construction. Potential risk associated with inhalation of COPCs in air for agricultural, residential, and recreational receptors, as well as oral/dermal exposure to COPCs in soil, plants, and livestock for agricultural receptors, were still considered as part of the health effects assessment, but no adverse health effects as a result of changes to air quality from Project-related emissions were identified (**Section 7.1 Human Health**).

The types of air emissions expected during Project construction (e.g., from construction equipment) are different than those associated with highway traffic, and Project construction is expected to have some influence on local air quality. However, because potential incremental changes to air quality associated with highway construction are well-understood and can be addressed through the application of mitigation measures that have been demonstrated to be effective, adverse residual effects of construction on air quality are expected to be low in magnitude, and confined to active construction areas. Such effects will be temporary, of short-duration, and fully reversible. Construction-related increase in air emission levels is not expected to overlap temporally or spatially with similar effects of other projects or activities and result in cumulative effects.

As described in **Section 4.10 Atmospheric Noise**, with the application of mitigation measures (e.g. noise barriers) in accordance with the Ministry's Noise Policy, post-construction ambient noise levels at most residential and institutional receptors along the Project alignment are predicted to be lower than current levels. This long-term operational residual effect of the Project on noise conditions at residential and institutional receptors are considered to be positive, and of negligible to low magnitude. Once the new bridge becomes operational, noise levels within Deas Island Regional Park, specifically in proximity to the bridge approach, will increase, but will remain below levels that warrant mitigation for residences, schools, and places of worship.

During construction, mitigation measures and best practices, including equipment and activity restrictions, appropriate scheduling of construction activities, noise monitoring, and community communication, will be implemented to minimize potential Project-related effects on ambient noise conditions. However, frequent construction noise will be experienced in areas near active construction sites. The magnitude of residual construction noise will vary from low to high, depending on receptor location relative to construction site, and nature of construction activity. Effects will be short-term during construction of interchanges etc., and of moderate term during pile installation for the new bridge. During other construction activities, effects of lower magnitude will be experienced occasionally to frequently at receptor sites along the corridor for short durations. All construction-related effects on atmospheric noise will be temporary and fully reversible. Project-related changes in atmospheric noise levels are not expected to overlap temporally or spatially with similar effects of other projects or activities and result in cumulative effects.

As discussed in **Section 7.1 Human Health**, potential Project-related effects on human health associated with changes in noise or vibration from Project construction activities (i.e., stress and annoyance, sleep disturbance, speech interference) at sensitive receptor sites are expected to be avoided or minimized through mitigation measures identified in **Section 4.10 Atmospheric Noise**, as referenced in the previous paragraph. The measures identified in the noise assessment for Project operation, such as noise barriers, are also expected to address the minimal increases in noise levels during that phase of the Project that could lead to stress and annoyance. The increase in average nighttime noise levels with the Project compared to existing conditions is not expected to be perceptible, and therefore not expected to incrementally affect sleep disturbance compared to existing conditions. With regard to average daytime noise levels that could exceed the speech comprehension threshold, the overall increase in noise levels as a result of Project operation over existing conditions is anticipated to be minimal (generally less than 5 dBA) and therefore not perceptible by the majority of affected receptors. Project operation is also not expected to substantially influence ground-borne vibration levels experienced by sensitive human receptors. No further mitigation is therefore proposed by the human health assessment beyond that proposed in **Section 4.10 Atmospheric Noise**.

An overview of the results of **Section 5.3 Land Use** are presented above in **Section 10.1.3.3** in relation to changes in access. In addition to potential Project-related access effects on residential, commercial, industrial, and recreational users, the land use assessment predicts potentially measurable noise-related effects on recreational users during Project construction

and operation, and visual quality effects on recreational users during Project operation. Residual effects as a result of noise and visual quality changes are also expected following the implementation of mitigation identified in **Section 4.10 Atmospheric Noise** and **5.5 Visual Quality**; however, these residual effects are not expected to change the level of recreational activities of this user group and are considered not significant.

Disturbance to the Cultural Landscape

As reviewed in **Section 10.1.3.2**, tangible, semi-tangible, and intangible cultural heritage sites and places in the Project Area that are linked to the exercise of Aboriginal Interests, including the Fraser River itself, were reported by Aboriginal Groups. Some of these sites and places are identified in **Table 10.1-1 Halkomelem Place Names in the Vicinity of the Project** (as well as , **Appendix 10-A, Figure 10-1**). These sites and places include an area on the north side of the Fraser River that has been described by Aboriginal Groups as “opposite” Deas Island and/or Tilbury Island (e.g., *Áəq̓tinəs*, *Tl’uq̓tinus*, and other variations), and an area on the south side of the Fraser River adjacent to Deas Island (e.g., *Pətxənéməx*, *pətxəneməx^w*, *Pulhxuneewmuhw*, and other variations). Table 10.01-1 describes *Tl’uq̓tinus* as being located on the south shore of Lulu Island, spanning from opposite Deas Island to Tilbury Island, and potentially extending from Woodward’s Landing (at the foot of No. 5 Road) to Ewen’s Cannery (on the west end of Lion Island), in the area of the Tunnel crossing.

Some of the specific concerns regarding tangible (e.g., archaeological resources), semi-tangible, and intangible cultural heritage raised by Aboriginal Groups during consultation with the Ministry included:

- Potential impacts to the quality of experience while using the Fraser River for cultural purposes (e.g., transportation, transmission of knowledge to younger generations) due to permanent alteration of the viewscape;
- Past impacts on cultural and archaeological sites as a result of anthropogenic changes and importance of preventing new impacts to cultural and archaeological sites and the cultural landscape;
- Need for thorough archaeological/heritage assessments, particularly but not only at interchanges and Deas Island, and protecting cultural heritage that has been passed down over thousands of years; and
- Importance of Aboriginal Group participation in assessments and reviewing archaeological reports and chance-find procedures.

Linked or Interrelated IC and VC Assessment Considerations for Disturbance to Cultural Landscape

The assessments presented in Part B of the Application were reviewed for relevance to the assessment of potential Project-related effects on the exercise of Aboriginal Interests as a result of potential disturbance to the cultural landscape, and specifically **Section 5.3 Land Use**, **Section 5.5 Visual Quality** and **Section 6.1 Heritage Resources**. The results of these assessments are summarized below.

The findings of **Section 5.3 Land Use** related to visual quality are summarized in the previous section related to air quality and noise and vibration levels. No specific mitigation measures are proposed in the land use assessment to manage potential Project-related visual quality effects on recreational users beyond the measure identified in **Section 5.5 Visual Quality**.

As outlined in **Section 5.5 Visual Quality**, potential Project-related effects on visual quality are not expected as a result of Project construction. During Project operation, visual quality within 1 km of the proposed bridge is expected to change, namely at Viewpoint 4 (Tunnel Access Road), Viewpoint 6 (Captain's Cove Marina), Viewpoint 9 (Millennium Trail), Viewpoint 10 (east of Captain's Cove Marina), and Viewpoint 14 (Millennium Trail beside Captain's Cove). At a distance of 1 km or greater, the bridge piers and deck will appear to merge with the natural and anthropogenic landscape, and the main visual features will be the bridge towers. Based on the visual resources assessment, visual quality is therefore not expected to change at locations beyond 1 km. This would include visual quality at Viewpoint 5, 11, 12, and 13, which are at setbacks between 1 km and 6 km from the proposed bridge (respectively, at Wellington Point Park near the entrance to Canoe Pass, at the foot of No. 5 Road, at the foot of No. 3 Road, and on Westham Island along Canoe Pass). Residual effects on visual conditions within 1 km are, however, expected as a result of Project operation, as mitigation measures (i.e., vegetation buffers) are not expected to fully reduce the effect of the new bridge, which will be noticeable compared to existing conditions (i.e., the Tunnel, a submerged feature); however, these effects are considered not significant, as the area around the Project has already been affected by moderate to high levels of human development, the visual environment is considered resilient to the incremental addition of a bridge, and the incremental residual change would not be expected to be experienced at locations beyond 1 km of the new bridge alignment. The likelihood of the effect occurring is considered moderate, but it is not considered likely to combine with the residual effects of other certain and reasonably foreseeable projects and activities that will be carried out, as these projects or activities do not appear to include structures or components that would be visible from the locations where Project-related changes in visual conditions are expected (refer to **Section 5.5 Visual Quality** for details).

The visual assessment notes that its findings are subjective as viewer perceptions and opinions on having a new bridge as part of the viewscape, and the aesthetics of the new bridge itself, would vary widely.

As discussed above in **Section 10.1.3.3.1, Section 6.1 Heritage Resources** reports that, while there are 14 recorded archaeological sites near the Project area (see **Figure 6.1-4**), Project-related effects to historical or archaeological (tangible) heritage sites within the Project area are not expected, as no sites were identified in the course of fieldwork; however, an Archaeological and Heritage Resources Management Plan, including a chance-find procedure, and additional archaeological surveys to visit areas that were partially inaccessible during the field inventory (see **Figure 6.1-2**) are proposed.

Summary of Potential Changes in the Quality of Experience in Exercising or Linked to the Exercise of Aboriginal Interests

Disturbance from Potential Changes in Air Quality or Noise or Vibration Levels

As reviewed above, Project operation activities are not expected to lead to perceptible changes in ground-borne vibration levels or result in residual adverse changes in air quality. For Project construction, potential air quality and vibration effects are expected to be mitigated to levels that will not affect human receptors. Consequently, Project-related air quality or vibration effects on the quality of experience in exercising Aboriginal Interests are either not expected or would be expected to be negligible with the implementation of mitigation measures identified in **Section 4.9 Air Quality** and **Section 4.10 Atmospheric Noise**.

With regard to noise, mitigation measures proposed in **Section 4.10 Atmospheric Noise** to largely address incremental noise changes related to Project construction and operation activities (which are relied upon in **Section 7.1 Human Health**), would also be expected to largely address this potential incremental Project-related effect to the quality of experience in the exercise of Aboriginal Interests over existing conditions; however, at locations where the exercise of Aboriginal Interests overlap or are in proximity to known noise-sensitive locations for which Project operation-related effects may not be fully mitigable or reversible (e.g., in and around Deas Island), and in relation to which other noise (e.g., boat engine noise) may not mask the incremental Project-related noise increase, changes in noise levels as a result of Project operation could conceivably have a measurable and permanent effect on the quality of experience at those locations for some but likely not all Schedule B Aboriginal Groups, by an unknown factor. To address this uncertainty and Schedule B Aboriginal Group concerns related to potential residual noise effects on the quality of experience while exercising Aboriginal Interests, additional consultative measures are identified below in **Section 10.1.3.4**.

Disturbance to the Cultural Landscape

As reported in **Section 6.1 Heritage Resources**, no archaeological or historical sites were identified within the Project area during fieldwork; however, the location of these sites may not always coincide, or coincide completely, with locations that have intangible cultural value or meaning to Aboriginal Groups (e.g., spiritual or storied sites, named places). Physical alterations to the landscape, irrespective of whether it results in impacts to archaeological or historical sites, may still affect how this landscape is experienced culturally.

For similar reasons, while **Section 5.5 Visual Quality** predicts that residual effects to visual quality may be experienced only within 1 km of the new bridge (i.e. after the addition of vegetation buffers), the addition of a new feature to this landscape may affect the quality of experience (i.e., cultural heritage) tied to the exercise of Aboriginal Interests both within and beyond 1 km.

Based on these considerations, mitigation measures proposed in **Section 5.5 Visual Quality** and **6.1 Heritage Resources** are not expected to address a potential incremental and permanent Project-related effect to the quality of experience tied to the exercise of Aboriginal Interests that may be associated with the introduction of a new prominent feature to the cultural landscape. Given, however, that this landscape has been previously modified by anthropogenic changes, the potential incremental Project-related effect on the quality of experience tied to the exercise of Aboriginal Interests is expected to be, before additional mitigation, minimally but permanently disruptive for Schedule B Aboriginal Groups, all of whom have identified a historical connection to and continued or desired use of sites or places that help define the cultural landscape in the Project area. Additional mitigation to address this potential incremental effect that is not otherwise addressed in the Application is proposed below in **Section 10.1.3.4**.

10.1.3.4 Mitigation Measures

This section identifies mitigation measures proposed to avoid, reduce, or otherwise manage potential adverse effects of the Project on the exercise of Aboriginal Interests described in **Section 10.1.3.3**, in a manner consistent with the methods described in **Section 3.5 Mitigation Measures** of the Application. The Ministry has considered the following opportunities identified by Schedule B Aboriginal Groups to date in proposing mitigation measures to address potential Project-related effects on Aboriginal Interests:

- Opportunities for reestablishing the original hydrodynamics of the area;

- Opportunities for enhancement/restoration of habitat that supports fishing, creation of shading/protective areas for fish, or other measures resulting in net gain rather than only “no net loss”;
- Opportunities to restore the shoreline of the river (e.g., marshes, cattail ecosystems);
- Opportunities to incorporate innovative design elements into the Project (e.g., rain gardens on the new bridge, dedicated commercial lanes);
- Opportunities to incorporate Aboriginal heritage into the bridge design, signage, and naming, and to involve Aboriginal Groups in that process, or otherwise publicly recognizing Aboriginal Group traditional territories and histories in the Project area; and
- Opportunities for Aboriginal Groups to benefit economically from the Project (e.g., employment and business opportunities).

Mitigation measures identified in Part B of the Application were reviewed in **Section 10.1.3.3** for their effectiveness at also addressing potential Project-related effects on the exercise of Aboriginal Interests. As described in **Section 10.1.3.3**, these measures are expected to be largely effective at avoiding, reducing, or otherwise managing potential Project-related effects on the exercise of Aboriginal Interests during Project construction and operation, except potentially in the following cases:

- Project construction:

Potential temporary direct effect on access related to instream construction activities and a potential temporary indirect effect on quality of experience (i.e., cultural heritage) tied to traditional uses dependent on that access, particularly for Musqueam Indian Band and Tsawwassen First Nation based on higher reported levels of current use

Potential temporary direct effect on quality of experience related to construction-related noise and a potential temporary indirect effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance

- Project operation:

Potential permanent direct effect on quality of experience related to traffic noise and a potential indirect effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

To address these potential Project-related effects – in addition to relevant mitigation measures identified in Part B for ICs and VCs linked to the exercise of Aboriginal Interests (as reviewed in **Section 10.1.3.3**) – ongoing consultation between the Ministry and Schedule B Aboriginal Groups is proposed during Application Review and subsequent to the issuance of an EAC, should the Project be approved. Plans for ongoing consultation following Application submission are laid out in **Section 10.1.2 Consultation Activities**. As part of those plans, the Ministry will continue to consult Schedule B Aboriginal Groups to facilitate their review of construction-related plans and designs and their involvement in Project components of interest, such as environmental enhancement and mitigation.

As described in **Section 12.0 Management Plans**, a CEMP will be prepared prior to the initiation of Project construction to provide guidance on actions and activities that will be carried out during that phase of the Project, and to identify measures to reduce the risk of occurrence of incidents that could affect the environment and reduce any effects that are unavoidable. A series of sub-plans within the CEMP will address activity-specific mitigation measures. Sub-plans that will include measures that are considered to be also effective at avoiding, reducing, or otherwise managing potential adverse effects of the Project on the exercise of Aboriginal Interests during Project construction were reviewed in **Section 10.1.3.3**. These include but are not necessarily limited to the following:

- Air Quality and Dust Control Management Plan
- Archaeological and Heritage Resources Management Plan
- Erosion and Sediment Control Plan
- Fish and Fish Habitat Management Plan
- Marine Mammal Management Plan
- Noise Management Plan
- Terrestrial Vegetation and Wildlife Management Plan
- Traffic Management Plan
- Marine Access Management Plan

As also described in **Section 12.0 Management Plans**, an OEMP will be developed prior to commencement of the operations phase of the Project. The OEMP will describe the environmental management measures and best management practices that will be in place throughout Project operation, and will address operation and maintenance activities that may adversely affect environmental, social, economic, heritage, or health components. Like the CEMP, the OEMP will include sub-plans to address activity-specific mitigation measures. Elements of the OEMP that are considered to be also effective at avoiding, reducing, or

otherwise managing potential adverse effects of the Project on the exercise of Aboriginal Interests during Project operation were identified in **Section 10.1.3.3**. Elements of the OEMP include but are not necessarily limited to the following:

- Management of stormwater and surface water runoff and maintenance of stormwater management features and facilities;
- Fish and Fish Habitat management, including if required a Fish Habitat Offsetting Plan; and
- Vegetation and Wildlife management plans.

To facilitate the inclusion of Aboriginal Interests considerations of Schedule B Aboriginal Groups into the effective management of potential Project construction and operation effects, the Ministry will consult affected Schedule B Aboriginal Groups on the development of plans contained within the CEMP and OEMP. For further details on the CEMP and OEMP, refer to **Section 12.0**.

As described in **Section 13.0 Monitoring and Follow-Up Programs**, an Environmental Monitoring Plan will be developed to guide implementation of the CEMP, OEMP, and associated management plans and monitoring programs. Monitoring programs that are considered to be also effective at avoiding, reducing, or otherwise managing potential adverse effects of the Project on the exercise of Aboriginal Interests were reviewed in **Section 10.1.3.3**. These programs are anticipated to include but not limited to the following:

- Air quality and noise monitoring program
- Water quality monitoring program
- Underwater noise monitoring program
- Wildlife monitoring program
- Fish and fish habitat monitoring program

As with the CEMP and OEMP, the Ministry will consult affected Schedule B Aboriginal Groups on the development of monitoring and follow-up programs to facilitate consideration and inclusion of their Aboriginal Interests. For further details on the Environmental Monitoring Plan, refer to **Section 13.0**.

After consideration of the measures identified by linked or interrelated SC and VC assessments, including the CEMP, OEMP, and Environmental Monitoring Plan relevant to those assessments, including consultation with Schedule B Aboriginal Groups on their development and implementation, the need for additional mitigation related to the quality of experience in exercising, or tied to the exercise of, Aboriginal Interests was identified in **Section 10.1.3.3**.

To specifically address a potentially measurable incremental Project-related effect on the quality of experience (i.e., cultural heritage) tied to the exercise of Aboriginal Interests that may be associated with the introduction of a new prominent feature to the cultural landscape, the Ministry proposes to work with affected Schedule B Aboriginal Groups to develop and implement a Cultural Heritage Management Plan, either separate from or as a subcomponent of the Archaeological and Heritage Resources Management Plan, to recognize the cultural heritage (e.g., named places, stories) of Schedule B Aboriginal Groups associated with the location of the new bridge. During consultation with the Ministry, Schedule B Aboriginal Groups raised suggestions to address cultural heritage such as incorporating Coast Salish themes into the new bridge design, giving the new bridge a traditional name, and/or creating viewpoints or kiosks along the alignment that describe or display Coast Salish history and artwork, among other potential considerations. The Ministry will discuss cultural heritage with Schedule B Aboriginal Groups.

10.1.3.5 Residual Effects

With the implementation of mitigation measures identified in **Section 10.1.3.4**, residual adverse effects of the proposed Project on the exercise of Aboriginal Interests are expected to be negligible (i.e., not measurable or detectable), and are not further assessed.

10.1.3.6 Outstanding Aboriginal Interests Issues Raised by Aboriginal Groups

As indicated in **Section 10.1.2.13 Process for Resolving Outstanding Issues Raised by Aboriginal Groups**, the Ministry acknowledges that some issues, concerns, or interests raised by Aboriginal Groups during the engagement and consultation process to date were not fully addressed prior to submission of the Application. A summary of the Ministry's perspective on the status of each Aboriginal Group's Aboriginal Interests issues (e.g., resolved, ongoing resolution, referred to agency, etc.) is provided in **Section 10.3 Issue Summary Table**.

10.1.3.7 Publicly Available Project Arrangements or Agreements with Aboriginal Groups

The Ministry is continuing to consult with each Schedule B Aboriginal Group to address issues that are specific to each Aboriginal Group. To date, the Ministry has undertaken to:

- Provide capacity funding to support meaningful participation in consultation activities with the Ministry and in the regulatory process, including the preparation of traditional use and knowledge studies to inform the Application;
- Provide opportunities for Aboriginal Groups to participate in fieldwork and studies; and
- Continue discussions with affected Aboriginal Groups related to Project benefits, both non-economic and economic, including training, employment, contracting, and other opportunities.

At this time, there are no publicly available details regarding arrangements or agreements between the Ministry and Aboriginal Groups. Such arrangements or agreements, where completed, typically remain confidential. For further details on the Ministry's completed and planned Aboriginal consultation activities and outcomes in relation to the Project, refer to **Section 10.1.2**.

10.1.3.8 Summary of the Aboriginal Interests Assessment by Aboriginal Group

Cowichan Tribes

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Cowichan Tribes at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Cowichan Tribes has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Cowichan Tribes has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at and about the reported location of *Tl'uqtinus*.

Based on the analysis potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Cowichan Tribes are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Fish resources for traditional use | ✓ | | ✓ | | |

| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Cowichan Tribes, except in the following potentially measurable cases:

- Project construction:
Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Cowichan Tribes regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of a Cultural Heritage Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Cowichan Tribes as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Cowichan Tribes is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Halalt First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Halalt First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Halalt First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Halalt First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at and about the reported location of *Tl'uqtinus*.

Based on the analysis potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Halalt First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Halalt First Nation, except in the following potentially measurable cases:

- Project construction:

Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:

Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Halalt First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Halalt First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Halalt First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Hwlitsum

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Hwlitsum at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Hwlitsum has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Hwlitsum has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including seasonal fishing at *Tl'uqtinus*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Hwlitsum are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |

Changes in Quality of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Water used for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |

Changes in Quality of Experience in Exercising, or tied to the Exercise, of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Upland locations for traditional use | ✓ | | ✓ | | |
| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |
| Noise | ✓ | ✓ | ✓ | ✓ | Construction - Potential temporary direct (minor) effect on quality of experience related to construction-related noise. Operation - Potential permanent direct (minor) effect on quality of experience related to traffic noise |
| Ground-borne vibration | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Cowichan Tribes, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Hwlitsum regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Hwlitsum as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Hwlitsum is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Katzie First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Katzie First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Katzie First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Katzie First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, such as the waterways within the Fraser River estuary that support Katzie First Nation subsistence and socio-economic ties between Katzie First Nation and downstream Aboriginal groups on the coast.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Katzie First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |
| Noise | ✓ | ✓ | ✓ | ✓ | <p>Construction - Potential temporary direct (minor) effect on quality of experience related to construction-related noise.</p> <p>Operation - Potential permanent direct (minor) effect on quality of experience related to traffic noise</p> |
| Ground-borne vibration | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Katzie First Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Katzie First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of a, Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Katzie First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Katzie First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Kwantlen First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Kwantlen First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Kwantlen First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Kwantlen First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including what Kwantlen First Nation report as past control over and use of, among other areas, the South Arm of the Fraser River to Deas Slough.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Kwantlen First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Kwantlen First Nation, except in the following potentially measurable cases:

- Project construction:

Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:

Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Kwantlen First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Kwantlen First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Kwantlen First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Lake Cowichan First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Lake Cowichan First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Lake Cowichan First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Lake Cowichan First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Lake Cowichan First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |

| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Lake Cowichan First Nation, except in the following potentially measurable cases:

- Project construction:

Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:

Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Lake Cowichan First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Lake Cowichan First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Lake Cowichan First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Lyackson First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Lyackson First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Lyackson First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Lyackson First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at or about the reported location of *Tl'uqtinus*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Lyackson First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Lyackson First Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Lyackson First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Lyackson First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Lyackson First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Musqueam Indian Band

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Musqueam Indian Band at locations or in relation to resources that may be potentially affected by Project construction or operation, including Musqueam Indian Band's proven Aboriginal right to fish for FSC purposes pursuant to *R. v. Sparrow* (see **Section 10.1.3.1**), is relatively high. Musqueam Indian Band has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Musqueam Indian Band has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at or about but not limited to the reported location of *Zuqtinus* or *λ'əqətines*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Musqueam Indian Band are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|--|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | | ✓ | | ✓ | <p>Construction - Potential temporary direct (minor to moderate) effect on access related to instream construction activities</p> <p>Operation - Potential indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses</p> |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |

Changes in Quality of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Water used for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |

Changes in Quality of Experience in Exercising, or tied to the Exercise, of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|--|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | | ✓ | | ✓ | Construction - Potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses dependent on that access Operation - Potential indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses |
| Upland locations for traditional use | ✓ | | ✓ | | |
| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|------------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Noise | ✓ | ✓ | ✓ | ✓ | Construction - Potential temporary direct (minor to moderate) effect on quality of experience related to construction-related noise. Operation - Potential permanent direct (minor to moderate) effect on quality of experience related to traffic noise |
| Ground-borne vibration | ✓ | | ✓ | | |
| Cultural landscape | | ✓ | | ✓ | Construction - Potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Musqueam Indian Band, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor to moderate) effect on access related to instream construction activities and a potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses dependent on that access

Potential temporary direct (minor to moderate) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance

- Project operation:

Potential permanent direct (minor to moderate) effect on quality of experience related to traffic noise and a potential indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Musqueam Indian Band regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Musqueam Indian Band as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Musqueam Indian Band is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Penelakut Tribe

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Penelakut Tribe at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Penelakut Tribe has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Penelakut Tribe has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at or about the reported location of *Tl'uq̓tinus*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Penelakut Tribe are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |

Changes in Quality of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|--|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |

| | Negligible | Measurable | Negligible | Measurable | |
| Upland locations for traditional use | ✓ | | ✓ | | |
| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |
| Noise | ✓ | ✓ | ✓ | ✓ | <p>Construction - Potential temporary direct (minor) effect on quality of experience related to construction-related noise.</p> <p>Operation - Potential permanent direct (minor) effect on quality of experience related to traffic noise</p> |
| Ground-borne vibration | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Penelakut Tribe, except in the following potentially measurable cases:

- Project construction:

Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:

Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Penelakut Tribe regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Penelakut Tribe as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Penelakut Tribe is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Semiahmoo First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Semiahmoo First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Semiahmoo First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Semiahmoo First Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including fishing at the reported location of *Tl'ektines*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Semiahmoo First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

| Upland locations for traditional use | ✓ | | ✓ | | |
| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |
| Noise | ✓ | ✓ | ✓ | ✓ | <p>Construction - Potential temporary direct (minor) effect on quality of experience related to construction-related noise.</p> <p>Operation - Potential permanent direct (minor) effect on quality of experience related to traffic noise</p> |
| Ground-borne vibration | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Semiahmoo First Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Semiahmoo First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Semiahmoo First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Semiahmoo First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Squamish Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Squamish Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Squamish Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of Aboriginal Interests. Squamish Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including fishing directly in the South Arm of the Fraser River for sockeye based on family ties with other Aboriginal groups (i.e., Musqueam Indian Band).

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Squamish Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |

| | Negligible | Measurable | Negligible | Measurable | |
| Upland locations for traditional use | ✓ | | ✓ | | |
| Water for cultural purposes | ✓ | | ✓ | | |
| Fish resources for traditional use | ✓ | | ✓ | | |
| Marine mammal resources for traditional use | ✓ | | ✓ | | |
| Terrestrial wildlife resources for traditional use | ✓ | | ✓ | | |
| Vegetation resources for traditional use | ✓ | | ✓ | | |
| Air quality | ✓ | | ✓ | | |
| Noise | ✓ | ✓ | ✓ | ✓ | <p>Construction - Potential temporary direct (minor) effect on quality of experience related to construction-related noise.</p> <p>Operation - Potential permanent direct (minor) effect on quality of experience related to traffic noise</p> |
| Ground-borne vibration | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Squamish Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Squamish Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Squamish Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Squamish Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Stz'uminus First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Stz'uminus First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Stz'uminus First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Stz'uminus First Nation has identified a desire to regain or increase, based on past use patterns and levels, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including at or about the reported location of *Tl'uqtinus*.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by the Stz'uminus First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | ✓ | | ✓ | | |
| Upland locations for traditional use | ✓ | | ✓ | | |

| | Construction | | Operation | | Residual Potential Effects |
|--------------------|--------------|------------|------------|------------|---|
| | Negligible | Measurable | Negligible | Measurable | |
| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Stz'uminus First Nation, except in the following potentially measurable cases:

- Project construction:

Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:

Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Stz'uminus First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Stz'uminus First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Stz'uminus First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Tsawwassen First Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Tsawwassen First Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively high. Tsawwassen First Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of Aboriginal Interests. Tsawwassen First Nation has stressed that its treaty rights pursuant to the TFNFA are not site specific, and that the current exercise of Aboriginal Interests pursuant to the TFNFA does not necessarily dictate the full extent of locations and resources in relation to which treaty rights may be exercised by Tsawwassen First Nation in the future.

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Tsawwassen First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|--|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |
| Instream locations for traditional use | | ✓ | | ✓ | <p>Construction - Potential temporary direct (minor to moderate) effect on access related to instream construction activities</p> <p>Operation - Potential indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses</p> |
| Upland locations for traditional use | ✓ | | ✓ | | |

Changes in Availability of Preferred Resources for the Exercise of Aboriginal Interests

| Cultural landscape | | ✓ | | ✓ | Construction - Potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Tsawwassen First Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor to moderate) effect on access related to instream construction activities and a potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses dependent on that access

Potential temporary direct (minor to moderate) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance

- Project operation:

Potential permanent direct (minor to moderate) effect on quality of experience related to traffic noise and a potential indirect (minor to moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Tsawwassen First Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Tsawwassen First Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Tsawwassen First Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Tsleil-Waututh Nation

As indicated in **Section 10.1.3.2**, the current exercise of Aboriginal Interests by Tsleil-Waututh Nation at locations or in relation to resources that may be potentially affected by Project construction or operation is relatively low. Tsleil-Waututh Nation has identified past and ongoing effects that have altered and reduced use over time, constraining the current exercise of their Aboriginal Interests. Tsleil-Waututh Nation has identified a desire to regain or increase, based on past patterns and levels of use, the exercise of Aboriginal Interests in relation to locations or resources that may be affected by Project components or activities, including resource harvesting at and traveling the South Arm of the Fraser River based on kinship ties with other Aboriginal groups (i.e., Musqueam Indian Band, Tsawwassen First Nation).

Based on the analysis of potential effect pathways on the exercise of Aboriginal Interests presented in **Section 10.1.3.3**, the potential Project-related effects and level of effect predicted in relation to the exercise of Aboriginal Interests by Kwantlen First Nation are assessed as follows.

Changes in Access to Preferred Locations for the Exercise of Aboriginal Interests

| | Construction | | Operation | | Residual Potential Effects |
|---|--------------|------------|------------|------------|----------------------------|
| | Negligible | Measurable | Negligible | Measurable | |
| River locations for traditional use as a result of changes to physical characteristics of these locations | ✓ | | ✓ | | |

| Cultural landscape | | ✓ | | ✓ | <p>Construction - Potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance</p> <p>Operation - Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses.</p> |

As reviewed in **Section 10.1.3.3** and **Section 10.1.3.4**, the mitigation measures, management plans, and monitoring programs identified in Part B of the Application for ICs or VCs linked to the exercise of Aboriginal Interests are expected to be largely effective at avoiding, reducing, or otherwise managing the incremental Project-related effects noted above on the exercise of Aboriginal Interests by Tseil-Waututh Nation, except in the following potentially measurable cases:

- Project construction:
 Potential temporary direct (minor) effect on quality of experience related to construction-related noise and a potential temporary indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance
- Project operation:
 Potential permanent direct (minor) effect on quality of experience related to traffic noise and a potential indirect (minor) effect on quality of experience (i.e., cultural heritage) tied to traditional uses that may be avoided due to direct sensory disturbance while engaged in those uses

 Potential permanent indirect (moderate) effect on quality of experience (i.e., cultural heritage) tied to traditional uses due to visual disturbance to the cultural landscape that informs and supports those uses

As indicated in **Section 10.1.3.4**, additional measures to address the above-noted effects include ongoing consultation with Tsleil-Waututh Nation regarding proposed measures, management plans, and monitoring programs related to the IC and VC assessments in Part B, the development of an Archaeological and Heritage Resources Management Plan, and the negotiation of a potential Project-specific agreement. With the implementation of these measures, residual effects on the exercise of Aboriginal Interests by Tsleil-Waututh Nation as a result of the Project are not expected. A summary of the results of the assessment on the exercise of Aboriginal Interests by Tsleil-Waututh Nation is presented in relationship to linked IC and VC assessments in **Section 10.3 Issue Summary Table, Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

10.2 Other Matters of Concern to Aboriginal Groups

This section of the Application provides a list of other matters of concern raised by Schedule B Aboriginal Groups in consultation with the Ministry that pertain to potential environmental, social, economic, heritage, and health effects of the Project that have not already been considered in **Section 10.1.3 Aboriginal Interests Assessment**. These other matters of concern are listed in **Table 10.2-1 Other Matters of Concern to Aboriginal Groups**.

For each matter of concern listed in **Table 10.2-1** below, relevant IC and VC assessments in Part B of the Application and the assessment presented in **Section 10.1.3** were reviewed to identify applicable measures to avoid, reduce, or otherwise manage the effects of the Project associated with the concern. Applicable or additional measures for each matter of concern are proposed in **Table 10.2-1**.

Table 10.2-1 Other Matters of Concern to Aboriginal Groups

| Concern | Aboriginal Group(s) | Proposed Mitigation Measures |
|---------------------------------------|--|---|
| Environmental | | |
| Contaminated sites | Cowichan Nation Alliance Semiahmoo First Nation Squamish Nation Tsawwassen First Nation | Section 12.0 Management Plans <ul style="list-style-type: none"> • Contaminated Sites and Sediment Plan |

| Socio-Economic | | |
| Effects of increased traffic, urbanization, and industrialization, and unleashing of “pent up demand” | Cowichan Nation Alliance Hwlitsum Lyackson First Nation Musqueam Indian Band Semiahmoo First Nation Tsawwassen First Nation | Section 5.3 Land Use <ul style="list-style-type: none"> N/A – Project not expected to contribute to overall regional growth trends under current land use regime Section 5.1 Traffic <ul style="list-style-type: none"> The proposed highway improvements will address existing and anticipated traffic safety concerns. |
| Potential spread of social problems, including drug and sex trafficking, to more areas in the Lower Mainland due to economic change | Lyackson First Nation | Sections 10.0 – Aboriginal Consultation 11.0 – Public Consultation <ul style="list-style-type: none"> Future consultation including that taking place during future stages of design focusing on addressing safety and security considerations. |
| New bridge creating areas of increased criminal activity and attracting a shadow population/marginalized groups | Lake Cowichan First Nation Lyackson First Nation | Sections 10.0 – Aboriginal Consultation 11.0 – Public Consultation <ul style="list-style-type: none"> Future consultation including that taking place during future stages of design focusing on addressing safety and security considerations. |
| Heritage | | |
| Downstream effects on archaeological sites from Tunnel decommissioning | Lyackson First Nation | Section 4.1 River Hydraulics and River Morphology <ul style="list-style-type: none"> N/A – Tunnel removal not expected to affect river flow or sedimentation patterns are expected to be negligible or minor and not requiring mitigation consideration |

| Concern | Aboriginal Group(s) | Proposed Mitigation Measures |
|---|---|--|
| Health | | |
| Suicide attempts from new bridge | Katzie First Nation Lake Cowichan First Nation Lyackson First Nation Tsleil-Waututh Nation | <p>Section 1.0 – Overview of Project and Proponent</p> <ul style="list-style-type: none"> The Project design includes provisions for safety fencing. <p>Sections 10.0 – Aboriginal Consultation 11.0 – Public Consultation</p> <ul style="list-style-type: none"> Future consultation, involving policing agencies, emergency response service providers and others, during future stages of design that focus on addressing safety and security considerations. |
| Emergency response times due to Highway 99 border traffic | Semiahmoo First Nation | <p>Sections 10.0 – Aboriginal Consultation 11.0 – Public Consultation</p> <ul style="list-style-type: none"> Future consultation, involving policing agencies, emergency response service providers and others, during future stages of design that focus on addressing safety and security considerations. |
| Potential for falling snow and ice from new bridge | Katzie First Nation Hwlitsum | <p>Section 12.0 Management Plans</p> <ul style="list-style-type: none"> OEMP |

10.2.1 Residual Effects to Other Matters of Concern

The Ministry's perspective on how other matters of concern have been addressed is reflected in the mitigation measures presented above in **Table 10.2-1**. In the Ministry's view, the measures identified are expected to be effective at addressing the listed concerns, particularly in light of the Ministry's plans to continue consultation with Schedule B Aboriginal Groups on management planning and monitoring (per **Section 10.1.3.4 Mitigation Measures**). As no measurable or detectable residual effects related to these matters of concern would be expected following the implementation of identified measures, they are not further assessed. It is acknowledged that Aboriginal Groups may have different perspectives on the effectiveness of measures to address potential effects on the listed concerns. Through ongoing consultation, the Ministry will seek and consider input from Aboriginal Groups on proposed mitigation measures and will continue to work with these groups to address any outstanding Project-related concerns

10.3 Issue Summary Table

The results of the analysis presented in **Section 10.1.3 Aboriginal Interests Assessment** and **Section 10.2 Other Matters of Concern to Aboriginal Groups**, including the findings of the assessments of ICs and VCs associated with the exercise of Aboriginal Interests or other matters of concern, are summarized in **Table 10.3-1 Summary Table of the Results of Aboriginal Consultation related to Aboriginal Interests/Other Matters of Concern**.

Comments provided to the Ministry by Schedule B Aboriginal Groups regarding their Aboriginal Interests and other matters of concern related to the Project are presented in **Appendix B Key Issues and Concerns**. These comments have been considered in the development of **Section 10.0 Aboriginal Consultation**, portions of which were reviewed by Aboriginal Groups prior to submission of the Application (i.e., community profiles presented in **Section 10.1.1 Background Information**; traditional territory and consultation area maps presented in **Appendix 10-A, Figure 10-2** through **Figure 10-10**; and summaries of past, present, and desired future use presented in **Section 10.1.3.2 Existing Conditions**). Based on these comments and ongoing consultation between the Ministry and Aboriginal Groups, including in relation to the findings of the IC and VC chapters, the Ministry has provided its perspective on the degree to which the issues related to Aboriginal Interests or other matters of concern to Aboriginal Groups are resolved in **Table 10.3-1**.

ABORIGINAL CONSULTATION REPORT

George Massey Tunnel Replacement Project

This page intentionally left blank

EXECUTIVE SUMMARY

The B.C. Ministry of Transportation and Infrastructure (the Ministry) is proposing the George Massey Tunnel Replacement Project (GMT or Project) to address congestion, meet forecast population and employment growth, and ensure Highway 99 continues to serve regional, provincial, and national transportation needs.

The George Massey Tunnel (Tunnel) is an important link in the regional and provincial transportation system, serving an average of 80,000 vehicles each day and connecting to key gateways that fuel our national, provincial and regional economies. Since the Tunnel opened in 1959, Metro Vancouver's population has grown considerably and is forecast to keep growing by more than one million people over the next 30 years.

The Project involves replacing the Tunnel with a new bridge spanning the Fraser River South Arm and Deas Island, decommissioning the Tunnel, and improving Highway 99 from Bridgeport Road in the City of Richmond (Richmond) to Highway 91 in the Corporation of Delta (Delta). The general alignment of the Project will follow the existing Highway 99 corridor, including across the Fraser River.

The Ministry provided the draft Project Description and Keys Areas of Study and the draft Application Information Requirements (dAIR) to Schedule B Aboriginal Groups for review and comment prior to the project entering the EA process. Further opportunities for review and comment on these documents and specifically on the Valued Components and study area boundaries proposed in the documents, were provided to Schedule B Aboriginal Groups through the Environmental Assessment Office's (EAO) Working Group process and ongoing consultation with the Ministry.

In accordance with EAO's Section 11 Order and as outlined in the Project's Aboriginal Consultation Plan, the Ministry has prepared Aboriginal Consultation Report 2 (Consultation Report). This Consultation Report summarizes consultation activities undertaken to date with Aboriginal Groups to share information and elicit input in relation to the Project, up to the time the Application is submitted to EAO. This document is intended to build on Consultation Report 1 and provide more detailed, Aboriginal Group-specific information regarding consultation activities, their Aboriginal Interests, issues and concerns raised to date, and the Ministry's related responses or actions.

Aboriginal Consultation is ongoing and to date, more than 80 meetings have been held with Aboriginal Groups regarding the Project. These activities have been undertaken in accordance with the Aboriginal Consultation Plan (Consultation Plan), approved by EAO, which outlines and guides Aboriginal consultation activities to be undertaken by the Ministry to satisfy Aboriginal consultation requirements identified in EAO's Section 11

ABORIGINAL CONSULTATION REPORT

George Massey Tunnel Replacement Project

Order¹. The Consultation Plan describes commitments and efforts to ensure that Aboriginal consultation throughout the EA process is undertaken in a manner that respects the individual needs of Aboriginal communities, meets the Crown's duty to consult, and meets the Crown's duty to accommodate where appropriate.

The Ministry is committed to a meaningful consultation and engagement process for the Project and recognizes the importance of Aboriginal Groups' involvement and input into Project planning, design and implementation.

¹ The Section 11 and Aboriginal Consultation Plan for the Project are available on EAO's website at http://a100.gov.bc.ca/appsdata/epic/html/deploy/epic_project_home_430.html.

1. INTRODUCTION

1.1 Project Overview

The Project will replace the Tunnel with a new 10-lane (8 lanes plus two dedicated transit/ high occupancy vehicle [HOV] lanes) bridge spanning the Fraser River South Arm, decommission the Tunnel, and improve Highway 99 from Bridgeport Road in Richmond to Highway 91 in Delta. Proposed improvements include replacing the Westminster Highway, Steveston Highway and Highway 17A interchanges, widening Highway 99 to accommodate dedicated HOV lanes, and providing a multi-use pathway on the bridge for cyclists and pedestrians to connect with the existing cycling and pedestrian networks on either side. Figure 1 illustrates the Project area.

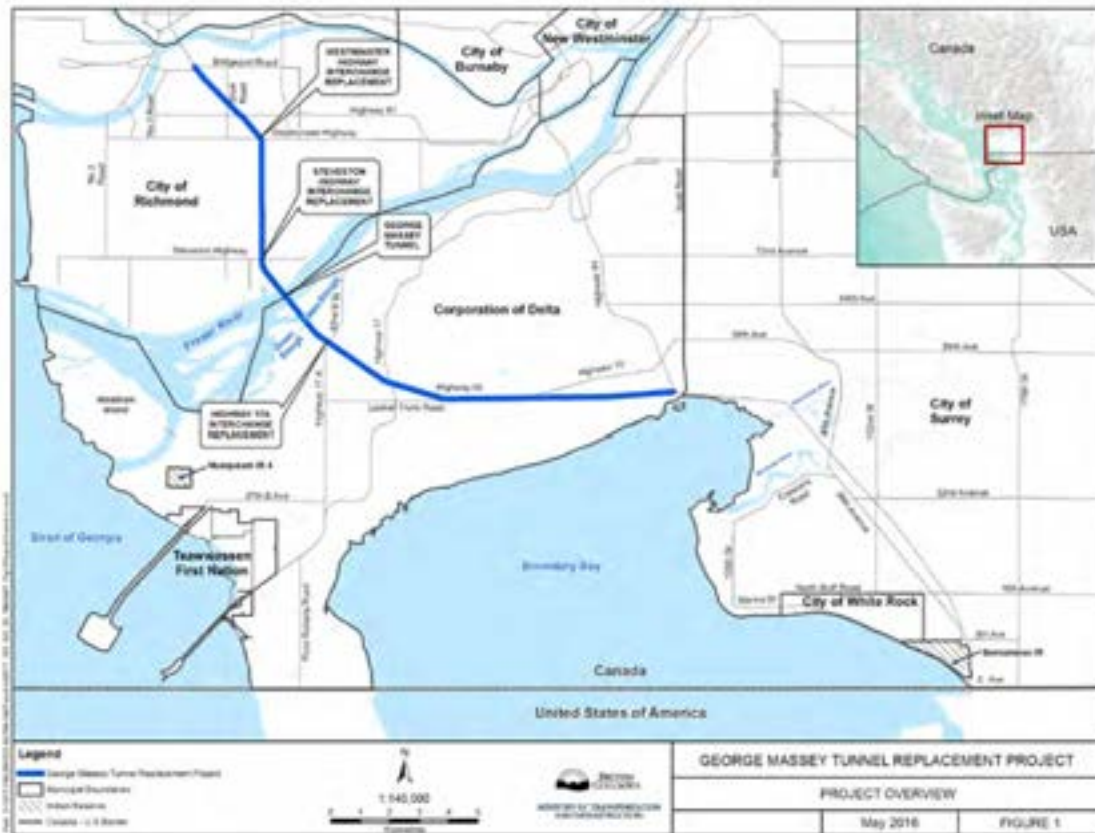

Figure 1 Project Area

The Project will have the same general alignment as the existing Highway 99 corridor and crossing of the Fraser River South Arm, linking Richmond and Delta in southwestern B.C.

1.2 Proponent Overview

The Project proponent is the B.C. Ministry of Transportation and Infrastructure working on behalf of the Province of British Columbia. If approved, the Environmental Assessment Certificate (EAC) and operational permits for the Project will be held by the Ministry.

1.3 Purpose of the Document

Section 15.3 of the Section 11 Order issued by EAO on March 7, 2016, requires that the Ministry submit Consultation Reports at the following points in time:

- Prior to EAO issuing the final Application Information Requirements to the Proponent;
- With submission of the Application for evaluation;
- No later than 100 days from beginning of Application Review stage; and
- At any time specified by the Project Assessment Lead.

This Consultation Report focuses on consultation undertaken prior to the Project entering the EA process as well as consultation during the pre-Application phase of the Project up until the submission of the Application for evaluation. The Initial Consultation phase, a period of early engagement and consultation outside of the EA process, ended with the filing of the Project Description and Key Areas of Study document in December 2015, which commenced the pre-Application phase of the EA process and the EA process itself. The Project is currently in the pre-Application phase of the EA Process, until EAO accepts the Ministry's Application for review following a 30-day screening of the Application, at which time it will enter the Application phase.

The purpose of this document is to build on information outlined in Aboriginal Consultation Report 1, which was provided to Aboriginal Groups in April 2016 for review and comment and submitted to EAO prior to issuing the final AIR. This document includes content specific to each of the Aboriginal Groups being consulted on the Project. This Consultation Report includes:

- Efforts undertaken to date by the Ministry to consult with each Aboriginal Group in relation to the Project;
- How the Ministry has complied with the Consultation Plan;

ABORIGINAL CONSULTATION REPORT

George Massey Tunnel Replacement Project

- Information and input received from each Aboriginal Group during consultation undertaken to date;
- Input from each Aboriginal Group regarding potential adverse effects of the proposed Project on their Aboriginal Interests² and
- Plans in relation to ongoing consultation on the proposed Project and any next steps with the specific Aboriginal Groups.

As a supplement to Aboriginal Consultation Report 1, this Consultation Report contains more detailed information regarding consultation activities. Building on the overview table of issues from Consultation Report 1, this document breaks out issues, concerns and the Ministry's response or actions to address these by each Aboriginal Group.

Pursuant to the Section 11 Order, a draft version of this report was shared with Aboriginal Groups listed in Schedules B of the Section 11 Order on May 27, 2016 for their review and comment. Aboriginal Groups were asked to provide their comments by June 17, 2016; however, any input received prior to June 29, 2016 was considered.

The Ministry considered comments from Aboriginal Group and, where appropriate, incorporated that feedback into this revised document. In consideration of the confidential nature of comments provided on the draft Consultation Plan and that specific consultation activities were planned for each Aboriginal Group, the Ministry responded directly to each group regarding their respective comments on the Aboriginal Consultation Plan.

Aboriginal Groups will be provided with a final copy of Aboriginal Consultation Report 2, along with an explanation of how their input has been considered and any resulting changes to the Report.

In accordance with the Section 11 Order, Aboriginal Consultation Report 2 was submitted to EAO for evaluation at the same time as the Application.

² Aboriginal Interests" means asserted or determined aboriginal rights, including title, and treaty rights.

2. ABORIGINAL CONSULTATION

2.1 Introduction

As outlined in Consultation Report 1, the Ministry is undertaking a four-phase consultation process with Aboriginal Groups that consists of initial Consultation, pre-Application Consultation, Application Review Consultation and Post EAC Consultation. These phases are outlined below.

To date more than 80 meetings have been held with Aboriginal Groups involved with the Project.

Table 1: Phases of Consultation with Aboriginal Groups

| | Consultation Phase | Overview | Duration/Status |
|---|------------------------------|---|---|
| 1 | Initial Consultation | Project development and planning up to submission of Project Description and Key Areas of Study document on December 16, 2015. Includes collection of baseline information, sharing of draft EA-related documents (i.e. Project Description and Areas of Study, dAIR) | To December 16, 2015 |
| 2 | Pre-Application Consultation | Period from the filing of the Project Description and Key Areas of Study to Application acceptance by EAO, including EAO's issuance of Section 11 Order, a 31 day public comment period on the Project description and Key Areas of Study document, development of the Application Information Requirements and collection of baseline information(may include submission of permit applications) | December 16 2015 – Acceptance of the Application by EAO (following screening of the Application). |

| | Consultation Phase | Overview | Duration/Status |
|---|--|--|-------------------------------------|
| 3 | Application review Consultation | Acceptance of the Application by EAO to the end of the Application Review stage (180 days). Application review will include a public comment period in a similar format as what was undertaken during pre-Application consultation. This Application review phase will be followed by the Minister's decision (up to 45 days), which could result in issuance of an Environmental Assessment Certificate (EAC) | Tentatively July 2016-February 2017 |
| 4 | Post Environmental Assessment Certificate (EAC) Consultation | Post EAC issuance to the date when all permit applications have been adjudicated and permits issued. | Tentatively March/April 2017 - 2022 |

2.2 Identification of Aboriginal Groups

On March 7, 2016, EAO issued an Order under Section 11 of the British Columbia *Environmental Assessment Act* which included the following Aboriginal Groups:

Schedule B Aboriginal Groups – Consultation and Invitation to Participate in Technical Working Group:

- Cowichan Tribes
- Halalt First Nation
- Katzie First Nation
- Kwantlen First Nation
- Lake Cowichan First Nation
- Lyackson First Nation
- Musqueam Indian Band
- Penelakut Tribe

- Hwlitsum³
- Semiahmoo First Nation
- Squamish Nation
- Stz'uminus First Nation
- Tsawwassen First Nation
- Tsleil-Waututh Nation

Schedule C Aboriginal Groups – Notification:

- People of the River Referrals Office

Prior to the Section 11 Order taking effect, the Ministry had received a deferral from the People of the River Referrals Office, which handles referrals for some member nations of the Stó:lō Tribal Council and Stó:lō Nation, as well as the six member nations of the Ts'elxweyeqw Tribe.

2.3 Summary of Consultation Activities with Cowichan Tribes

The following section summarizes consultation undertaken with Cowichan Tribes during the Initial Consultation and the pre-Application Phases of the Project. This content reflects efforts taken to consult with Cowichan Tribes and issues, concerns and interests raised to date. The Ministry considered Cowichan Tribes's input on the draft of this Consultation Report, and revised content where appropriate, and will share a final version of the Consultation Report with Cowichan Tribes.

Cowichan Tribes, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation advised the Ministry that they would participate in the environmental assessment process as part of Cowichan Nation Alliance. As noted below, the Ministry provided information and funding directly to Cowichan Tribes. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribes represented Cowichan Nation Alliance in correspondence, meetings and fieldwork.

Initial Consultation Phase

The Ministry initiated consultation with Cowichan Tribes in early 2014.

In support of consultation during the Initial Consultation Phase the following Ministry-led

³ This reference to the Hwlitsum is not intended to signify any change in the position that the Province may have taken in other contexts in relation to the duty to consult with this group.

activities have been undertaken with Cowichan Tribes:

- Meetings with Cowichan Tribes Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of studies.

During initial discussions with Cowichan Tribes, and as demonstrated in the Consultation Plan and participation funding agreements with Cowichan Tribes, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Cowichan Tribes.

In addition to meetings, Cowichan Tribes participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, the Deas Slough Bridge, and Deas Island, as well as anticipated works and enhancement opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Cowichan Tribes's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

These discussions were supported by presentations and where possible, involved the Project's subject matter experts. The Ministry offered to present on any topic of interest to Cowichan Tribes during this phase including any of the presentations from the May 2015 Environmental Update package (contents detailed in list of materials).

During the Initial Consultation Phase, the Ministry sought Cowichan Tribes' input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Overview Assessment
- Draft Archaeological Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

With the exception of the draft Aboriginal Consultation Plan, the Ministry met with Cowichan Tribes and walked through these draft documents. Focused discussions on

these documents were intended to explain the scope and content, to respond to any initial questions and to elicit input.

While early drafts of these documents such as the Project Description and Key Areas of Study and the draft Application Information Requirements were shared during the Initial Consultation Phase, they were provided again in their revised format for further review in the pre-Application Phase.

Meetings with Cowichan Tribes

Between early 2014 and May 2016, the Ministry and Cowichan Tribes discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. Meetings and related activities undertaken with Cowichan Tribes in relation to the Project are outlined below.

At meetings with Cowichan Tribes during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Cowichan Tribes' past, current and future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Cowichan Tribes' Aboriginal Interests. The Ministry also sought to determine Cowichan Tribes' preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

In coordinating and conducting meetings with Cowichan Tribes, wherever possible, the Ministry has ensured the following:

- Meetings were held at the preferred location and in the preferred format for Cowichan Tribes.
- Meetings were scheduled at a date and time convenient for Cowichan Tribes and that facilitated the attendance of key representatives.
- Input into the agenda was considered in the planning of the meeting and, where input had not been provided beforehand, the agenda made provisions for additional topics to be discussed.
- Technical and knowledgeable Ministry representatives have been present.
- Materials have been shared beforehand and are provided in a preferred format.
- Meetings have been respectful, productive and consistent with the principles and objectives of the Consultation Plan.

During this period, key topics and presentations covered during meetings with Cowichan

ABORIGINAL CONSULTATION REPORT

As outlined in the Project’s Consultation Plan, the Ministry has been committed to sharing Project-related information with Cowichan Tribes as it becomes available. The Ministry considered the provision of early drafts of key EA documents to Cowichan Tribes members as an opportunity to:

- Acknowledge and respond, in part, to known concerns regarding the high volume of project referrals, challenging timelines for review and limited resources to allocate to EA review processes;
- Meet the objective of sharing Project-related documents in a timely manner with the intent to facilitate Cowichan Tribes review and comment;
- Consider and incorporate input, address concerns and identify gaps in relation to key aspects of the Project (e.g. Valued Components, studies and study area boundaries) prior to the pre-Application Phase; and to
- Allow time for meetings to be coordinated and conducted regarding particular documents or aspect of the Project of interest to Cowichan Tribes in advance of the pre-Application Phase.

During the Initial Consultation Phase, the Ministry communicated with Cowichan Tribes through letters, email and phone calls.

Letters sent to Cowichan Tribes during this consultation Phase include:

- Introductory letters notifying Cowichan Tribes of the Project and offering to meet regarding the proposed Project;

- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment letters to Cowichan Tribes requesting review and comment on the draft Archaeological Overview Assessment.
- Project Description letters to Cowichan Tribes accompanying a draft copy of the Project Description and Key Areas of Study document requesting review and comment; and

Email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Cowichan Tribes;
- Follow up to meetings or earlier communications;
- Provision of Project-related documents, updates and sharing of information;
- Response to concerns or questions in relation to the Project;
- Clarification of information and feedback shared by Cowichan Tribes; and
- To address and resolve Project-related concerns.

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Cowichan Tribes;
- Confirmation of information and follow up to previous communications;
- Updates and sharing of information; and
- To address and resolve Project-related concerns.

Aboriginal Consultation Plan – Cowichan Tribes review and comment

From the beginning of consultation, the Ministry worked with Cowichan Tribes to develop a mutually acceptable consultation approach, including the manner in which Cowichan Tribes was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

The Ministry's Draft Aboriginal Consultation Plan was informed by regulatory and legal requirements, the importance of enhancing or maintaining a positive, respectful and productive working relationship with Cowichan Tribes, and specific input received during initial GMT consultation meetings with Cowichan Tribes. The Draft Consultation Plan listed consultation activities, agreed to by both parties, and specified under the Cowichan Tribes capacity funding agreement.

The Ministry undertook the activities below in order to obtain and, where appropriate,

incorporate, input on the Draft Aboriginal Consultation Plan:

- Email request for review and comment with the Draft Aboriginal Consultation Plan provided as an attachment.
- Follow up communications (email and phone calls) to schedule a meeting to discuss the Draft Consultation Plan.
 - Discuss or obtain clarification on any comments provided by Cowichan Tribes to the Ministry.
- Revision of Draft Consultation Plan
- Sharing of Revised Consultation Plan and a summary of responses to Cowichan Tribes's comments/input.
 - Revised Consultation Plan and, for ease of reference, original Draft Consultation Plan provided via email.
 - Summary of comments/input provided by Cowichan Tribes and corresponding action taken by the Ministry (i.e. revision to plan, comment "noted", request for further discussion regarding request).

In consideration of the confidential nature of comments provided on the draft Consultation Plan and that specific consultation activities were planned for each Aboriginal group, the Ministry responded directly to Cowichan Tribes regarding their respective comments on the Consultation Plan. Where Aboriginal Groups comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Based on feedback received to date and discussions with Cowichan Tribes on this matter, the Ministry is of the understanding that Cowichan Tribes and its members have no outstanding concerns or comments with respect to the Plan.

Comments were received from Cowichan Tribes on the Draft Consultation Plan via letter, October 30 2015. The Consultation Plan was revised, based on input received from all Aboriginal Groups, and approved by EAO on April 6, 2016.

Capacity Funding

During Initial Consultation meetings, Cowichan Tribes identified the need for capacity funding to support Cowichan Tribes' involvement in Project consultation activities, review of EA-related documents and participation in the pre-Application phase of the EA process. Cowichan Tribes also identified the need for funding for a Cowichan Tribes Study. The Ministry and Cowichan Tribes worked together to finalize a funding agreement. This agreement specifies the activities covered under the agreements and Project/EA-related documents for Cowichan Tribes review and comment.

Involvement in Archaeological Component of the Project

From the outset of discussions, Cowichan Tribes identified the importance of the archaeological component of the Project and of Cowichan Tribes involvement in fieldwork and review of draft archaeological documents. All draft archaeological documents were shared with Cowichan Tribes for review and comment. The Ministry and its archaeologist met with Cowichan Tribes to present on this aspect of the Project. Cowichan Tribes participated in all archaeological fieldwork for the Project.

Cowichan Tribes commented on the Draft Heritage Resources Overview Assessment via letter June 25, 2015.

During Initial Consultation Phase, Cowichan Tribes provided input on the Project and commented on EA-related documents in meetings, via email, phone and letter.

Documents and formal comments received from Cowichan Tribes during this phase include:

- FLNRO Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Key Areas of Study (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Cowichan Tribes with funding for the submission of a Traditional Use Study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015
- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Tribes, August 25, 2015

- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

Pre-Application Consultation Phase

The following section outlines consultation activities that the Ministry has undertaken with Cowichan Tribes during the pre-Application Phase. The approach was developed with input from Cowichan Tribes during the Initial Consultation Phase described above and EAO, and is outlined in the Consultation Plan. It is also informed by EAO's Section 11 Order, specifically Part G section 13 and 14, which outlines consultation requirements for the Ministry.

As it pertains to consultation with Cowichan Tribes, during the pre-Application phase, the Ministry has:

- Provided capacity funding to support continued involvement in Project consultation activities and the regulatory process;
- Provided relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Cowichan Tribes' Aboriginal Interests;
- Identified and provided, where possible, opportunities for Cowichan Tribes to participate in fieldwork (River otter study);
- Identified and documented questions, issues and interests raised by Cowichan Tribes;
- Continued to work with Cowichan Tribes to identify potentially affected Aboriginal Interests;
- Identified measures to avoid, mitigate, or where required accommodate, potential adverse effects on Aboriginal Interests as appropriate; and
- Supported EAO-led Technical Working Group.

Funding for Application Review

The Ministry will work with Cowichan Tribes with respect to the provision of capacity funding for the Application Review Phase, with the aim of providing reasonable capacity support for participation in the review of the EA and any related permitting processes. Funding is intended to facilitate participation in technical reviews and analyses, for involvement in ongoing consultation activities (as specified in the Consultation Plan), to support Cowichan Tribes in presenting information regarding their respective Aboriginal Interests and to ensure the consultation requirements pursuant to the Section 11 Order are met and the Consultation Plan is implemented as intended. The Ministry will work

with Cowichan Tribes in an effort to finalize funding agreements for the Application Review phase.

Consultation on EA-related documents

During this phase, the Ministry consulted Cowichan Tribes on the following Project-related documents:

- Draft Project Description and Key Areas of Study (Project Description);
- Draft Application Information Requirements;
- Content of draft Part C of the Environmental Assessment Application; and
- Draft Consultation Report 1

The Ministry provided draft Part C content and mapping to Cowichan Tribes for review and comment by letters/emails (April 18, 2016). Cowichan Tribes provided comments on this draft via a letter/email (May 05, 2016) along with the Cowichan Tribes' Declaration (signed Jan 2016) and Schedule A and B maps.

In letters/emails of April 22, 2016, the Ministry provided draft Consultation Report 1 to Cowichan Tribes for review and comment prior to finalization and submission to EAO. Cowichan Tribes reviewed the draft and advised that they had no comments or requested changes (email May 05, 2015).

During this phase documents/information shared by Cowichan Tribes include:

- Environment Canada's Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Name (Working Group, March 10, 2016)

Cowichan Nation Alliance participated in the Working Group and commented on the Draft Application Information Requirements. The Ministry responded to the Working Group on comments received in relation to the dAIR.

Participation in Fieldwork

In April 2016, Cowichan Tribes was invited to participate in river otter-related fieldwork. The objectives of this work were to document river otter relative abundance within the Regional Assessment Area, document and describe use of riparian areas, identify high use areas, and potential areas and options for mitigation. A Cowichan Nation Alliance representative from Penelakut Tribe participated in this work.

Materials shared with Cowichan Tribes during the pre-Application Phase are outlined below:

| Document | Description |
|---|---|
| Project Description and Key Areas of Study (Project Description) | Document prepared according to guidance provided in EAO's <i>Guidelines for Preparing a Project Description for an Environmental Assessment in British Columbia</i> (EAO 2013). |
| Draft Application Information Requirements | The Working Group review of the draft Application Information Requirements (dAIR) commenced on January 6, 2016 . The dAIR outlines the studies, methods and information required for the Application for an Environmental Assessment Certificate. |
| Draft Application Information Requirements Presentation (December 2015) | Discussions of how comments received on first draft Application Information Requirements document were integrated into the next revised version. |
| Application Information Requirements | Final version of the document was issued on May 24, 2016. |
| Aboriginal Consultation Plan (April 2016) | Final version of Aboriginal Consultation Plan that incorporated input received from Aboriginal Groups and EAO. |
| List of Project-related documents on the GMT Project website | A list of Project-related documents available in the Project document library on the Project website. |
| Health Impact Assessment (HIA) scoping document | Document outlining scope of the HIA and input being sought from Aboriginal groups/Working Group members. |
| Draft Part C content | Draft components of Part C for review and comment by Schedule B Aboriginal groups: baseline summaries and mapping. |
| Aboriginal Consultation Report 1 | Draft summary of general consultation undertaken to date on the Project. For review and comment. |
| Aboriginal Consultation Report 2 | Draft report with Aboriginal Group-specific information on consultation undertaken to date on the Project. For review and comment. |

Meetings with Cowichan Tribes – pre-Application Phase

During the pre-Application Phase, the Ministry met three times with Cowichan Tribes (see list of meetings for details) and conducted a conference call in relation to Cowichan Tribes' interest in the procurement process and Project-related benefits and to discuss

comments on the draft Part C content and Aboriginal Consultation Report 1.

Cowichan Tribes communicated directly with EAO with respect to the EA process. EAO led two Working Group meetings. Halalt represented Cowichan Nation Alliance at the first Working Group meeting. Halalt and Cowichan Tribes represented Cowichan Nation Alliance at the second Working Group meeting. These meetings focused on the following:

- Working Group Meeting (January 21, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - Project overview and update
 - Key Areas of Study
 - dAIR Overview
 - Preliminary conclusions from study results to date
- Working Group Meeting (March 10, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - List of materials available on Project website
 - Review of comments received on dAIR and resulting changes to the dAIR
 - Description and rationale of assessment areas

In addition, Cowichan Nation Alliance was offered and provided with two separate Working Group meetings which took place following EAO-led Working Group meetings. These were attended by Cowichan Tribes, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation.

Communications Methods

During the pre-Application Phase, email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Cowichan Tribes
- Follow up to meetings or earlier communications
- Provision of Project-related documents, updates and sharing of information
- Response to concerns or questions in relation to the Project
- Clarification of information and feedback shared by Cowichan Tribes and its members to address and resolve Project-related concerns

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Cowichan Tribes and its members
- Confirmation of information and follow up to previous communications
- Updates and sharing of information
- To address and resolve Project-related concerns

Documents for review were shared via email, in letter format and via mail/courier. Letters sent to Cowichan Nation Alliance members during this Phase include:

- Letter requesting review of Draft Part C content
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Consultation on Aboriginal Consultation Report 2

Pursuant to the Section 11 Order, a draft version of this report was shared with Cowichan Tribes for review and comment.

Cowichan Tribes provided feedback on Aboriginal Consultation Report 2 via a Cowichan Nation Alliance letter of June 22, 2016, noting an error on page 159 that needed to be addressed in the revised document and requesting the table of meetings (pages 151-154) be modified to provide greater clarity with respect to meeting attendees. Aboriginal Consultation Report 2 has been revised to reflect this input.

Cowichan Tribes will be provided with a final copy of Aboriginal Consultation Report 2 along with an explanation of how their input has been considered and reflected in the final Aboriginal Consultation Report 2.

Concerns, Issues and Interests Raised by Cowichan Tribes

Consultation efforts to date, have sought to identify and address concerns and issues raised by Cowichan Tribes during the Initial Consultation and pre-Application Phases. The Ministry requested Cowichan Tribes' input on Appendix A: Key Issues and Concerns to both Aboriginal Consultation Reports to ensure that issues and concerns have been accurately and appropriately captured. Aboriginal Consultation Report 2's Appendix A has been revised to reflect input received to date and to include status and next steps. This table is also included in Part C as Appendix C2.

2.4 Summary of Consultation Activities with Halalt First Nation

The following section summarizes consultation undertaken with Halalt First Nation during the Initial Consultation and the pre-Application Phases of the Project. This content reflects efforts taken to consult with Halalt First Nation and issues, concerns and interests raised to date. The Ministry considered Halalt First Nation's input on the draft of this Consultation Report, and revised content where appropriate, and will share a final version of the Consultation Report with Halalt First Nation.

Cowichan Tribes, Halalt First Nation, Penelakut Tribe and Stz'uminus First Nation advised the Ministry that they would participate in the environmental assessment process as part of Cowichan Nation Alliance. As noted below, the Ministry provided information and funding directly to Halalt First Nation. However, Cowichan Nation Alliance provided feedback and participated in meetings and fieldwork. Unless noted otherwise, Cowichan Tribes represented Cowichan Nation Alliance in correspondence, meetings and fieldwork.

Initial Consultation Phase

The Ministry initiated consultation with Halalt First Nation in early 2014.

In support of consultation during the Initial Consultation Phase the following Ministry-led activities have been undertaken with Halalt First Nation:

- Meetings with Halalt First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of studies.

During initial discussions with Halalt First Nation, and as demonstrated in the Consultation Plan and participation funding agreements with Halalt First Nation, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Halalt First Nation.

Halalt First Nation was represented by Cowichan Nation Alliance in meetings and fieldwork. Halalt First Nation participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, the Deas Slough Bridge, and Deas Island, as well as anticipated works and enhancement opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Halalt First Nation's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

These discussions were supported by presentations and where possible, involved the Project's subject matter experts. The Ministry offered to present on any topic of interest to Halalt First Nation during this phase including any of the presentations from the May 2015 Environmental Update package (contents detailed in list of materials).

During the Initial Consultation Phase, the Ministry sought Halalt First Nation's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Overview Assessment
- Draft Archaeological Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

With the exception of the draft Aboriginal Consultation Plan, the Ministry met with Halalt First Nation, represented by Cowichan Nation Alliance, and walked through these draft documents. Focused discussions on these documents were intended to explain the scope and content, to respond to any initial questions and to elicit input.

While early drafts of these documents such as the Project Description and Key Areas of Study and the draft Application Information Requirements were shared during the Initial Consultation Phase, they were provided again in their revised format for further review in the pre-Application Phase.

Meetings with Halalt First Nation

Between early 2014 and May 2016, the Ministry and Halalt First Nation and Cowichan Nation Alliance discussed and exchanged Project-related information through emails, phone calls, a community meeting and in-person meetings. Meetings and related activities undertaken with Halalt First Nation or Cowichan Nation Alliance in relation to the Project are outlined below.

At meetings with Cowichan Nation Alliance during Initial Consultation, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Halalt First Nation's past, current and future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Halalt First Nation's Aboriginal Interests. The

Ministry also sought to determine Halalt First Nation’s preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed. Halalt First Nation confirmed that they would like to receive notifications directly; however, they would be represented by Cowichan Nation Alliance in correspondence, meetings and fieldwork.

In coordinating and conducting meetings with Cowichan Nation Alliance, wherever possible, the Ministry has ensured the following:

- Meetings were held at the preferred location and in the preferred format for Cowichan Nation Alliance.
- Meetings were scheduled at a date and time convenient for Cowichan Nation Alliance and that facilitated the attendance of key representatives.
- Input into the agenda was considered in the planning of the meeting and, where input had not been provided beforehand, the agenda made provisions for additional topics to be discussed.
- Technical and knowledgeable Ministry representatives have been present.
- Materials have been shared beforehand and are provided in a preferred format.
- Meetings have been respectful, productive and consistent with the principles and objectives of the Consultation Plan.

During this period, key topics and presentations covered during meetings with Cowichan Nation Alliance include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

As outlined in the Project's Consultation Plan, the Ministry has been committed to sharing Project-related information with Cowichan Nation Alliance members as it becomes available. The Ministry considered the provision of early drafts of key EA documents to Cowichan Nation Alliance members as an opportunity to:

- Acknowledge and respond, in part, to known concerns regarding the high volume of project referrals, challenging timelines for review and limited resources to allocate to EA review processes;
- Meet the objective of sharing Project-related documents in a timely manner with the intent to facilitate Cowichan Nation Alliance members' review and comment;
- Consider and incorporate input, address concerns and identify gaps in relation to key aspects of the Project (e.g. Valued Components, studies and study area boundaries) prior to the pre-Application Phase; and to
- Allow time for meetings to be coordinated and conducted regarding particular documents or aspect of the Project of interest to Cowichan Nation Alliance members in advance of the pre-Application Phase.

During the Initial Consultation Phase, the Ministry communicated with Cowichan Nation Alliance members through letters, email and phone calls.

Letters sent to Halalt First Nation during this consultation Phase include:

- Introductory letters notifying Halalt First Nation of the Project and offering to meet regarding the proposed Project;
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment letters to Halalt First Nation requesting review and comment on the draft Archaeological Overview Assessment.
- Project Description letters to Halalt First Nation accompanying a draft copy of the Project Description and Key Areas of Study document requesting review and comment; and

Email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Halalt First Nation;
- Follow up to meetings or earlier communications;
- Provision of Project-related documents, updates and sharing of information;
- Response to concerns or questions in relation to the Project;
- Clarification of information and feedback shared by Halalt First Nation; and
- To address and resolve Project-related concerns.

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Halalt First Nation;
- Confirmation of information and follow up to previous communications;
- Updates and sharing of information; and
- To address and resolve Project-related concerns.

Aboriginal Consultation Plan – Halalt First Nation review and comment

From the beginning of consultation, the Ministry worked with Halalt First Nation to develop a mutually acceptable consultation approach, including the manner in which Halalt First Nation was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

The Ministry's Draft Aboriginal Consultation Plan was informed by regulatory and legal requirements, the importance of enhancing or maintaining a positive, respectful and productive working relationship with Halalt First Nation, and specific input received during initial GMT consultation meetings with Cowichan Nation Alliance representatives. The Draft Consultation Plan listed consultation activities, agreed to by both parties, and specified under the Halalt First Nation's capacity funding agreement.

The Ministry undertook the activities below in order to obtain and, where appropriate, incorporate, input on the Draft Aboriginal Consultation Plan:

- Email request for review and comment with the Draft Consultation Plan provided as an attachment.
- Follow up communications (email and phone calls) to schedule a meeting to discuss the Draft Consultation Plan.
 - Discuss or obtain clarification on any comments provided by Cowichan Nation Alliance representatives to the Ministry.
- Revision of Draft Consultation Plan
- Sharing of Revised Consultation Plan and a summary of responses to Cowichan Nation Alliance's comments/input.
 - Revised Consultation Plan and, for ease of reference, original Draft Consultation Plan provided via email.
 - Summary of comments/input provided by Cowichan Nation Alliance and corresponding action taken by the Ministry (i.e. revision to plan, comment

“noted”, request for further discussion regarding request).

In consideration of the confidential nature of comments provided on the draft Aboriginal Consultation Plan and that specific consultation activities were planned for each Aboriginal group, the Ministry responded directly to both Halalt First Nation and Cowichan Nation Alliance regarding their respective comments on the Aboriginal Consultation Plan. Where Aboriginal Groups comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Based on feedback received to date and discussions with Halalt First Nation and Cowichan Nation Alliance on this matter, the Ministry is of the understanding that Halalt First Nation have no outstanding concerns or comments with respect to the Plan.

Comments were received from Cowichan Nation Alliance on the Draft Aboriginal Consultation Plan via letter, October 30 2015. The Consultation Plan was revised, based on input received from Cowichan Nation Alliance and other Aboriginal Groups, and approved by EAO on April 6, 2016.

Capacity Funding

During Initial Consultation meetings, Halalt First Nation identified the need for capacity funding to support Halalt First Nation’s involvement in Project consultation activities, review of EA-related documents and participation in the pre-Application phase of the EA process. Halalt First Nation also identified the need for funding for a Halalt First Nation Study. The Ministry and Halalt First Nation worked together to finalize a funding agreement. This agreement specifies the activities covered under the agreement and Project/EA-related documents for Halalt First Nation’s review and comment.

Involvement in Archaeological Component of the Project

From the outset of discussions, Halalt First Nation identified the importance of the archaeological component of the Project and of Halalt First Nation’s involvement in fieldwork and review of draft archaeological documents. All draft archaeological documents were shared with Halalt First Nation for review and comment. The Ministry and its archaeologist met with Halalt First Nation to present on this aspect of the Project. Cowichan Nation Alliance representatives from Cowichan Tribes, Penelakut Tribe and Stzùminus First Nation participated in all archaeological fieldwork for the Project.

Cowichan Nation Alliance commented on the Draft Heritage Resources Overview Assessment via letter June 25, 2015.

During Initial Consultation Phase, Halalt First Nation and Cowichan Nation Alliance provided input on the Project and commented on EA-related documents in meetings, via email, phone and letter.

Documents and formal comments received from Halalt First Nation during this phase include:

- FLNRO Map of Cowichan Nation Alliance Use and Occupancy of the Project Area (Email Feb 11, 2015)
- Comment on Draft Project Description and Key Areas of Study (Letter March 09, 2015)
- Comments on Heritage Resources Overview Assessment (Letter June 25, 2015)
- Comments on Draft Application Information Requirements (Letter August 05, 2015)
- Comments on Draft Aboriginal Consultation Plan (Letter October 30, 2015)
- Salish Sea Vessel Traffic Projections (Email November 19, 2015)

The Ministry provided Halalt First Nation with funding for the submission of a Traditional Use Study. The following three studies were submitted to the Ministry:

- Cowichan Nation Traditional, Current, and Planned Future Use of the George Massey Tunnel Replacement Bridge Project Area, prepared by Candace Charlie for Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 9, 2015
- George Massey Tunnel Replacement Project: Cowichan Occupation and Use of the Project Lands, prepared by Dorothy Kennedy for David Robbins of Woodward and Co., Counsel for the Cowichan Tribes, on behalf of the Cowichan Nation Alliance, August 25, 2015
- Historical Geography of Cowichan Land Use and Occupancy Lower Fraser River: Map Series and Report, prepared for Woodward and Company and the Cowichan Tribes by Kenneth G. Brealey, May 31, 2010

Pre-Application Consultation Phase

The following section outlines consultation activities that the Ministry has undertaken with Halalt First Nation during the pre-Application Phase. The approach was developed with input from Halalt First Nation and Cowichan Nation Alliance during the Initial Consultation Phase described above and EAO, and is outlined in the Consultation Plan. It is also informed by EAO's Section 11 Order, specifically Part G section 13 and 14, which outlines consultation requirements for the Ministry.

As it pertains to consultation with Halalt First Nation, during the pre-Application phase, the Ministry has:

- Provided capacity funding to support continued involvement in Project

consultation activities and the regulatory process;

- Provided relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Halalt First Nation's Aboriginal Interests;
- Identified and provided, where possible, opportunities for Halalt First Nation and Cowichan Nation Alliance to participate in fieldwork (River otter study);
- Identified and documented questions, issues and interests raised by Halalt First Nation and Cowichan Nation Alliance;
- Continued to work with Halalt First Nation to identify potentially affected Aboriginal Interests;
- Identified measures to avoid, mitigate, or where required accommodate, potential adverse effects on Aboriginal Interests as appropriate; and
- Supported EAO-led Technical Working Group.

Funding for Application Review

The Ministry will work with Halalt First Nation with respect to the provision of capacity funding for the Application Review Phase, with the aim of providing reasonable capacity support for participation in the review of the EA and any related permitting processes. Funding is intended to facilitate participation in technical reviews and analyses, for involvement in ongoing consultation activities (as specified in the Consultation Plan), to support Halalt First Nation in presenting information regarding their Aboriginal Interests and to ensure the consultation requirements pursuant to the Section 11 Order are met and the Consultation Plan is implemented as intended. The Ministry will work with Halalt First Nation in an effort to finalize a funding agreement for the Application Review phase.

Consultation on EA-related documents

During this phase, the Ministry consulted Halalt First Nation on the following Project-related documents:

- Draft Project Description and Key Areas of Study (Project Description);
- Draft Application Information Requirements;
- Content of draft Part C of the Environmental Assessment Application; and
- Draft Consultation Report 1

The Ministry provided draft Part C content and mapping to Halalt First Nation for review and comment by letters/emails (April 18, 2016). Cowichan Nation Alliance provided comments on this draft via a letter/email (May 05, 2016) along with the Cowichan Nation Alliance Declaration (signed Jan 2016) and Schedule A and B maps.

In letters/emails of April 22, 2016, the Ministry provided draft Consultation Report 1 to Halalt First Nation for review and comment prior to finalization and submission to EAO. Halalt First Nation and Cowichan Nation Alliance reviewed the draft and Cowichan Nation Alliance advised that they had no comments or requested changes (email May 05, 2015).

During the pre-Application Phase, documents/information shared by Halalt First Nation includes:

- Environment Canada’s Streambank Lupine information (Email March 31, 2016)
- Steveston Diking Referral Part1 & 2 (Email March 16, 2016)
- Cowichan Nation Alliance Strength of Claim Assessment – Aboriginal Right to Fish for Food in the South Arm of the Fraser River (Email April 15 2016)
- List of Place Name (Working Group, March 10, 2016)

Cowichan Nation Alliance participated in the Working Group and commented on the Draft Application Information Requirements. The Ministry responded to the Working Group on comments received in relation to the dAIR.

Participation in Fieldwork

In April 2016, Halalt First Nation and Cowichan Nation Alliance were invited to participate in river otter-related fieldwork. The objectives of this work were to document river otter relative abundance within the Regional Assessment Area, document and describe use of riparian areas, identify high use areas, and potential areas and options for mitigation. A Cowichan Nation Alliance representative from Halalt First Nation participated in this work.

Materials shared with Halalt First Nation during the pre-Application Phase are outlined below:

Meetings with Halalt First Nation – pre-Application Phase

During the pre-Application Phase, the Ministry met three times with Cowichan Nation Alliance (see list of meetings for details) and conducted a conference call in relation to Cowichan Nation Alliance' interest in the procurement process and Project-related benefits and to discuss comments on the draft Part C content and Aboriginal

Consultation Report 1.

Cowichan Nation Alliance attended two EAO-led Working Group meetings and communicated directly with EAO with respect to the EA process. Halalt represented Cowichan Nation Alliance at the first Working Group meeting. Halalt First Nations and Cowichan Tribes represented Cowichan Nation Alliance at the second Working Group meeting. The EAO-led Working Group meetings focused on the following:

- Working Group Meeting (January 21, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - Project overview and update
 - Key Areas of Study
 - dAIR Overview
 - Preliminary conclusions from study results to date
- Working Group Meeting (March 10, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - List of materials available on Project website
 - Review of comments received on dAIR and resulting changes to the dAIR
 - Description and rationale of assessment areas

Cowichan Nation Alliance was offered and provided with two separate Working Group meetings which took place following EAO-led Working Group meetings. These were attended by Cowichan Tribes, Halalt First Nation, Halalt First Nation and Stz'uminus First Nation.

Communications Methods

During the pre-Application Phase, email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Halalt First Nation and Cowichan Nation Alliance
- Follow up to meetings or earlier communications
- Provision of Project-related documents, updates and sharing of information
- Response to concerns or questions in relation to the Project
- Clarification of information and feedback shared by Halalt First Nation and

Cowichan Nation Alliance

- To address and resolve Project-related concerns

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Halalt First Nation and Cowichan Nation Alliance
- Confirmation of information and follow up to previous communications
- Updates and sharing of information
- To address and resolve Project-related concerns

Documents for review were shared via email, in letter format and via mail/courier. Letters sent to Halalt First Nation during this Phase include:

- Letter requesting review of Draft Part C content
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Consultation on Aboriginal Consultation Report 2

Pursuant to the Section 11 Order, a draft version of this report was shared with Halalt First Nation for review and comment.

Halalt First Nation provided feedback on Aboriginal Consultation Report 2 via a Cowichan Nation Alliance letter of June 22, 2016, noting an error on page 159 that needed to be addressed in the revised document and requesting the table of meetings (pages 151-154) be modified to provide greater clarity with respect to meeting attendees. Aboriginal Consultation Report 2 has been revised to reflect this input.

Halalt First Nation will be provided with a final copy of Aboriginal Consultation Report 2 along with an explanation of how their input has been considered and reflected in the final Aboriginal Consultation Report 2.

Concerns, Issues and Interests Raised by Cowichan Nation Alliance

Consultation efforts to date, have sought to identify and address concerns and issues raised by Halalt First Nation and Cowichan Nation Alliance during the Initial Consultation and pre-Application Phases. The Ministry requested Halalt First Nation`s input on Appendix A: Key Issues and Concerns to both Aboriginal Consultation Reports to ensure that issues and concerns have been accurately and appropriately captured. Aboriginal Consultation Report 2`s Appendix A has been revised to reflect input received to date

and to include status and next steps. This table is also included in Part C as Appendix D2.

2.5 Summary of Consultation Activities with Katzie First Nation

The following section summarizes consultation undertaken with the Katzie First Nation (Katzie) during the Initial Consultation and the pre-Application Phases of the Project. This content reflects efforts taken to consult with Katzie and of the issues, concerns and interests raised to date.

Initial Consultation Phase

The Ministry initiated consultation with Katzie in early 2014. In support of consultation undertaken during the Initial Consultation Phase the following Ministry-led activities have been undertaken with Katzie:

- Meetings with Katzie First Nation Chief and Council, staff and consultants;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission of a Katzie First Nation Project-specific Study.

During initial discussions with Katzie, and as demonstrated in the Consultation Plan and Katzie/George Massey Tunnel Replacement Project Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Katzie.

In addition to meetings with Katzie representatives during the Initial Consultation Phase, Katzie was invited to participate in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, the Deas Slough Bridge, and Deas Island, as well as anticipated works and enhancement opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Katzie's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

Discussions were supported by presentations and where possible, involved the Project's subject matter experts. The Ministry offered to present on any topic of interest to Katzie during this phase including any of the presentations from the May 2015 Environmental Update package (contents detailed in list of materials).

During the Initial Consultation Phase, the Ministry sought Katzie's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Overview Assessment
- Draft Archaeological Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

With the exception of the Draft Consultation Plan, the Ministry met with Katzie and walked through these draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input.

While early drafts of these documents such as the Project Description and Key Areas of Study and the draft Application Information Requirements were shared during the Initial Consultation Phase, they were provided again in their revised format for further review in the pre-Application Phase.

Meetings with Katzie First Nation

Between early 2014 and May 2016, the Ministry and Katzie discussed and exchanged Project-related information through emails, phone calls, and in-person meetings. Meetings and related activities undertaken with Katzie in relation to the Project are outlined below.

At meetings with Katzie during the Initial Consultation Phase, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Katzie's past, current and desired future use of the Project area for traditional purposes, and any concerns related to potential impacts on Katzie's Aboriginal Interests. The Ministry also sought to determine Katzie's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

In coordinating and conducting meetings with Katzie, wherever possible, the Ministry has ensured the following:

- Meetings were held at the preferred location and in the preferred format for Katzie.
- Meetings were scheduled at a date and time convenient for Katzie and that facilitated the attendance of key representatives.

ABORIGINAL CONSULTATION REPORT
George Massey Tunnel Replacement Project

- Input into the agenda was considered in the planning of the meeting and, where input had not been provided beforehand, the agenda made provisions for additional topics to be discussed.
- Technical and knowledgeable Ministry representatives have been present.
- Materials have been shared beforehand and are provided in a preferred format.
- Meetings have been respectful, productive and consistent with the principles and objectives of the Consultation Plan.

During this period, key topics and presentations covered during meetings with Katzie include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

As outlined in the Project's Consultation Plan, the Ministry has been committed to sharing Project-related information with Katzie First Nation as it becomes available. The Ministry considered the provision of early drafts of key EA documents to Katzie as an opportunity to:

- Acknowledge and respond, in part, to known concerns regarding the high volume of project referrals, challenging timelines for review and limited resources to allocate to EA review processes;
- Meet the objective of sharing Project-related documents in a timely manner with the intent to facilitate Katzie's review and comment;
- Consider and incorporate input, address concerns and identify gaps in relation to key aspects of the Project (e.g. Valued Components, studies and study area boundaries) prior to the pre-Application Phase; and to
- Allow time for meetings to be coordinated and conducted regarding particular documents or aspect of the Project of interest to Katzie in advance of the pre-Application Phase.

During the Initial Consultation Phase, the Ministry communicated with Katzie through letters, email and phone calls.

Letters sent to Katzie during this consultation Phase include:

- Introductory letter notifying Katzie of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment letter requesting review and comment on the Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment (document also provided).

Email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Katzie representatives;
- Follow up to meetings or earlier communications;
- Provision of Project-related documents, updates and sharing of information;
- Response to concerns or questions in relation to the Project;

Clarification of information and feedback shared by Katzie; and

- To address and resolve Project-related concerns.

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Katzie
- Confirmation of information and follow up to previous communications;
- Updates and sharing of information; and
- To address and resolve Project-related concerns.

Materials shared with Katzie are listed in Aboriginal Consultation Report 1.

Aboriginal Consultation Plan – Katzie review and comment

From the beginning of consultation, the Ministry worked with Katzie to develop a mutually acceptable consultation approach, including the manner in which Katzie was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or

minimize those effects) were to be communicated and addressed by the Ministry.

The Ministry's Draft Aboriginal Consultation Plan was informed by regulatory and legal requirements, the importance of enhancing or maintaining a positive, respectful and productive working relationship with Katzie, an established working relationship with Katzie, and specific input received during initial GMT consultation meetings with Katzie: The Draft Consultation Plan listed consultation activities, agreed to by both parties, and specified under the Katzie/GMT capacity funding agreement.

The Ministry undertook the activities below in order to obtain and, where appropriate, incorporate, input on the Draft Aboriginal Consultation Plan:

- Email request for review and comment with the Draft Consultation Plan provided as an attachment.
- Follow up communications (email and phone calls) to schedule a meeting to discuss the Draft Consultation Plan.
 - Discuss or obtain clarification on any comments provided by Katzie to the Ministry.
- Revision of Draft Consultation Plan
- Sharing of Revised Consultation Plan and a summary of responses to Katzie's comments/input.
 - Revised Consultation Plan and, for ease of reference, original Draft Consultation Plan provided via email.
 - Summary of comments/input provided by Katzie and corresponding action taken by the Ministry (i.e. revision to plan, comment "noted", request for further discussion regarding request).

In consideration of the confidential nature of comments provided on the draft Plan and that specific consultation activities were planned for each Aboriginal Group, the Ministry responded directly to each group regarding their respective comments on the Plan. Where Aboriginal Groups comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Based on feedback received to date and discussions with Katzie on this matter, the Ministry is of the understanding that Katzie has no outstanding concerns or comments with respect to the Plan.

Katzie submitted comments on the Draft Aboriginal Consultation Plan in a November 20, 2015 letter/email. The Consultation Plan was revised, based on input received from Katzie and other Aboriginal Groups, and approved by EAO on April 6, 2016.

Capacity Funding

During Initial Consultation meetings, Katzie identified the need for capacity funding to support Katzie's involvement in Project consultation activities, review of EA-related documents and participation in the pre-Application phase of the EA process. Katzie also identified the need for funding for a Katzie Traditional Use Study. The Ministry and Katzie worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Katzie's review and comment. Katzie submitted a study entitled "George Massey Tunnel Replacement: Katzie First Nation Traditional Use Study".

Involvement in Archaeological Component of the Project

From the outset of discussions, Katzie identified the importance of the archaeological component of the Project and of their involvement in fieldwork and review of draft archaeological documents. All draft archaeological documents were shared with Katzie for review and comment. The Ministry and its archaeologist met with Katzie to present on this aspect of the Project. Katzie has participated in all archaeological fieldwork for the Project.

Pre-Application Consultation

The following section outlines consultation activities that the Ministry has undertaken with Katzie during the pre-Application Phase. The approach was developed with input from Katzie during the Initial Consultation Phase described above and EAO, and is outlined in the Consultation Plan. It is also informed by EAO's Section 11 Order, specifically Part G section 13 and 14, which outlines consultation requirements for the Ministry.

As it pertains to consultation with Katzie, during the pre-Application phase, the Ministry has:

- Provided capacity funding to support continued involvement in Project consultation activities and the regulatory process;
- Provided all relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Katzie's Aboriginal Interests;
- Identified and provided, where possible, opportunities for Katzie to participate in fieldwork (River otter study);
- Identified and documented questions, issues and interests raised by Katzie;
- Continued to work with Aboriginal Groups to identify potentially affected Aboriginal Interests;

- Identified measures to avoid, mitigate, or where required accommodate, potential adverse effects on Aboriginal Interests as appropriate; and
- Supported EAO-led Technical Working Group.

Funding for Application Review

The Ministry will work with Katzie with respect to the provision of capacity funding for the Application Review Phase, with the aim of providing reasonable capacity support for participation in the review of the EA and any related permitting processes. Funding is intended to facilitate participation in technical reviews and analyses, for involvement in ongoing consultation activities (as specified in the Consultation Plan); to support Katzie in presenting information regarding their respective Aboriginal Interests and to ensure the consultation requirements pursuant to the Section 11 Order are met and the Consultation Plan is implemented as intended. The Ministry is working with Katzie to finalize a funding agreement for the Application Review phase i.

Consultation on EA-related documents

During this phase, the Ministry consulted Katzie on the following Project-related documents:

- Draft Project Description and Key Areas of Study (Project Description);
- Draft Application Information Requirements;
- Content of draft Part C of the Environmental Assessment Application
- Draft Consultation Report 1; and
- Draft Consultation Report 2

Katzie provided comments on the draft Project Description and Key Areas of Study document via letter dated January 4, 2016.

Consultation on Aboriginal Consultation Report 1

The Ministry provided draft Aboriginal Consultation Report 1 to Katzie for review and comment prior to finalization and submission to EAO indicating that feedback received by May 2, 2106, would be incorporated into the final version as appropriate. Katzie informed the Ministry that Katzie had no comments on draft Aboriginal Consultation Report 1.

Participation in fieldwork

In April 2016, Katzie participated in river otter-related fieldwork. The objectives of this work were to document river otter relative abundance within the Regional Assessment

Area, document and describe use of riparian areas, identify high use areas, and potential areas and options for mitigation.

Materials shared with Katzie during the pre-Application Phase are outlined below:

| Document | Description |
|---|---|
| Project Description and Key Areas of Study (Project Description) | Document prepared according to guidance provided in EAO's <i>Guidelines for Preparing a Project Description for an Environmental Assessment in British Columbia</i> (EAO 2013). |
| Draft Application Information Requirements | The Working Group review of the draft Application Information Requirements (dAIR) commenced on January 6, 2016 . The dAIR outlines the studies, methods and information required for the Application for an Environmental Assessment Certificate. |
| Draft Application Information Requirements Presentation (December 2015) | Discussion of how comments received on first draft Application Information Requirements document were integrated into the next revised version. |
| Application Information Requirements | Final version of the document was issued on May 24, 2016. |
| Aboriginal Consultation Plan (April 2016) | Final version of Aboriginal Consultation Plan that incorporated input received from Aboriginal Groups and EAO. |
| Draft Part C content | Draft components of Part C for review and comment by Schedule B Aboriginal groups: baseline summaries and mapping. |
| Aboriginal Consultation Report 1 | Draft summary of general consultation undertaken to date on the Project. For review and comment. |
| Aboriginal Consultation Report 2 | Draft summary with more detailed information of consultation undertaken to date on the Project. For review and comment. |

Meetings with Katzie First Nation

During the pre-Application Phase, the Ministry met twice with Katzie (see list of meetings for details). Katzie was invited to two EAO-led Working Group meetings. The EAO-led Working Group meetings focused on the following:

- Working Group Meeting (January 21, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process

- Project overview and update
- Key Areas of Study
- dAIR Overview
- Preliminary conclusions from study results to date
- Working Group Meeting (March 10, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - List of materials available on Project website
 - Review of comments received on dAIR and resulting changes to the dAIR
 - Description and rationale of assessment areas

Communications Methods

During the pre-Application Phase, email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Katzie representatives
- Follow up to meetings or earlier communications
- Provision of Project-related documents, updates and sharing of information
- Response to concerns or questions in relation to the Project
- Clarification of information and feedback shared by Katzie
- To address and resolve Project-related concerns

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Katzie
- Confirmation of information and follow up to previous communications
- Updates and sharing of information
- To address and resolve Project-related concerns

Documents for review were shared via email, in letter format and via mail/courier. Letters sent to Katzie during this Phase include:

- Letter requesting review of Draft Part C content
- Letter requesting review of Draft Aboriginal Consultation Report 1

- Letter requesting review of Draft Aboriginal Consultation Report 2

Katzie informed the Ministry that Katzie had no comments on draft Part C content or Aboriginal Consultation Report 1.

On May 18, 2016, the Ministry received a letter from Katzie, Kwantlen and Semiahmoo First Nations expressing concern with the Project's procurement strategy and requesting further dialogue with respect to business opportunities. The three Nations communicated their continued concern with respect to the procurement strategy in a June 2016 Project update meeting, whereby they indicated that a response to their May 18, 2016 letter was required prior to their continued engagement on the Project. In a June 23, 2016 letter, Katzie, Kwantlen and Semiahmoo reiterated their concern with the Project's procurement strategy and that the EA and procurement process was advancing prior to their concerns being addressed. The Ministry acknowledges the concern expressed by the three Nations and will continue to work with Katzie, Kwantlen and Semiahmoo First Nations in an effort to address this and any other Project-related concerns.

Consultation on Aboriginal Consultation Report 2

Pursuant to the Section 11 Order, a draft version of this report was shared with Katzie for review and comment. Katzie did not provide comments on Report 2 but reiterated that they have significant concern with the Project's procurement strategy and that the EA process is advancing prior to changes to this strategy.

Katzie will be provided with a final copy of the Consultation Report along with an explanation of how their input has been considered and any changes to the final Report 2 as a result of their feedback.

Concerns, Issues and Interests Raised by Katzie First Nation

Consultation efforts to date, have sought to identify and address concerns and issues raised by Katzie during the Initial Consultation and pre-Application Phases. The Ministry requested Katzie's input on Appendix A: Key Issues and Concerns to both Aboriginal Consultation Reports to ensure that issues and concerns have been accurately and appropriately captured. Aboriginal Consultation Report 2's Appendix A has been revised to reflect input received to date and to include status and next steps. This table is also included in Part C as Appendix D2.T

As noted in the above section, Katzie has expressed significant concern with the Project's procurement strategy. The Ministry is committing to working with Katzie to address this concern.

2.6 Summary of Consultation Activities with Kwantlen First Nation

The following section summarizes consultation undertaken with the Kwantlen First Nation (Kwantlen) during the Initial Consultation and the pre-Application Phases of the Project. This content reflects efforts taken to consult with Kwantlen and of the issues, concerns and interests raised to date. The Ministry considered Kwantlen's input on the draft of this Consultation Report and revised content where appropriate, and will share a final version of the Consultation Report with Kwantlen.

Initial Consultation Phase

The Ministry initiated consultation with Kwantlen in early 2014. In support of consultation during the Initial Consultation Phase the following Ministry-led activities have been undertaken with Kwantlen:

- Meetings with Kwantlen First Nation Chief and Council, staff and consultants;
- Site visit;
- Sharing of Project-related materials;
- Sharing of draft documents for review and comment;
- Provision of capacity funding to support participation in consultation activities, review of documents, and submission a Kwantlen First Nation Project-specific Study.

During initial discussions with Kwantlen, and as demonstrated in the Consultation Plan and Kwantlen/George Massey Tunnel Replacement Project Funding Agreement, the Ministry sought input in the development of a consultation approach, and later a Consultation Plan, specific to Kwantlen.

In addition to meetings with Kwantlen representatives during the Initial Consultation Phase, Kwantlen was invited to participate in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, the Deas Slough Bridge, and Deas Island, as well as anticipated works and enhancement opportunities for Green Slough.

Consultation activities during this period were focused on, among other things, the Project scope and schedule, proposed Studies/Valued Components, and identification of potential impacts on Kwantlen's Aboriginal Interests and mitigation measures that may be used to avoid or minimize any effects.

These discussions were supported by presentations and where possible, involved the Project's subject matter experts. The Ministry offered to present on any topic of interest to Kwantlen during this phase including any of the presentations from the May 2015 Environmental Update package (contents detailed in list of materials).

During the Initial Consultation Phase, the Ministry sought Kwantlen's input on the following EA-related documents:

- Project Description and Key Areas of Study
- Draft Archaeological Overview Assessment
- Draft Archaeological Heritage Resources Assessment
- Draft Aboriginal Consultation Plan
- Draft Application Information Requirements

With the exception of the Draft Consultation Plan, the Ministry met with Kwantlen and walked through these draft documents, in an effort to explain the scope and content, to respond to any initial questions and to elicit input.

While early drafts of these documents such as the Project Description and Key Areas of Study and the draft Application Information Requirements were shared during the Initial Consultation Phase, they were provided again in their revised format for further review in the pre-Application Phase.

Meetings with Kwantlen First Nation

Between early 2014 and May 2016, the Ministry and Kwantlen discussed and exchanged Project-related information through emails, phone calls, and in-person meetings. Meetings and related activities undertaken with Kwantlen in relation to the Project are outlined below.

At meetings with Kwantlen during the Initial Consultation Phase, the Ministry provided introductory information regarding the proposed Project scope and Project schedule, and sought input with respect to Kwantlen's past, current and desired future use of the Project area for the exercise of identified Aboriginal Interests, and any concerns related to potential impacts on Kwantlen's Aboriginal Interests. The Ministry also sought to determine Kwantlen's preferences with respect to participation in Project consultation, EA review, and related activities. During the initial meetings, communications protocols were established and key contacts were identified and/or confirmed.

In coordinating and conducting meetings with Kwantlen, wherever possible, the Ministry has ensured the following:

- Meetings were held at the preferred location and in the preferred format for Kwantlen.
- Meetings were scheduled at a date and time convenient for Kwantlen and that facilitated the attendance of key representatives.

ABORIGINAL CONSULTATION REPORT
George Massey Tunnel Replacement Project

- Input into the agenda was considered in the planning of the meeting and, where input had not been provided beforehand, the agenda made provisions for additional topics to be discussed.
- Technical and knowledgeable Ministry representatives have been present.
- Materials have been shared beforehand and are provided in a preferred format.
- Meetings have been respectful, productive and consistent with the principles and objectives of the Consultation Plan.

During this period, key topics and presentations covered during meetings with Kwantlen include: Archaeology/Heritage Resources, Wildlife, Marine Use, Fish and Fish Habitat, Traffic, Human Health (air and noise), River Hydraulics and Morphology, Utilities, Green Slough concept, Project Description and Key Areas of Study document, Project Definition Report and the Draft Application Information Requirements.

In addition to meetings with Kwantlen representatives during the Initial Consultation Phase, Kwantlen participated in a site visit which focused on key Project components, mutual sharing of information, plans for Tunnel decommissioning, the Deas Slough

Bridge, and Deas Island, as well as anticipated works and enhancement opportunities for Green Slough.

As outlined in the Project's Consultation Plan, the Ministry has been committed to sharing Project-related information with Kwantlen as it becomes available. The Ministry considered the provision of early drafts of key EA documents to Kwantlen as an opportunity to:

- Acknowledge and respond, in part, to known concerns regarding the high volume of project referrals, challenging timelines for review and limited resources to allocate to EA review processes;
- Meet the objective of sharing Project-related documents in a timely manner with the intent to facilitate Kwantlen's review and comment;
- Consider and incorporate input, address concerns and identify gaps in relation to key aspects of the Project (e.g. Valued Components, studies and study area boundaries) prior to the pre-Application Phase; and to
- Allow time for meetings to be coordinated and conducted regarding particular documents or aspect of the Project of interest to Kwantlen in advance of the pre-Application Phase.

During the Initial Consultation Phase, the Ministry communicated with Kwantlen through letters, email and phone calls.

Letters sent to Kwantlen during this consultation Phase include:

- Introductory letter notifying Kwantlen of the Project and offering to meet regarding the proposed Project;
- Project Description letter accompanying a draft copy of the Project Description and Areas of Study document requesting review and comment; and
- Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment letter requesting review and comment on the Draft Heritage Resources Overview Assessment/Archaeological Overview Assessment (document also provided).

Email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Kwantlen representatives;
- Follow up to meetings or earlier communications;
- Provision of Project-related documents, updates and sharing of information;

- Response to concerns or questions in relation to the Project;
- Clarification of information and feedback shared by Kwantlen; and
- To address and resolve Project-related concerns.

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Kwantlen;
- Confirmation of information and follow up to previous communications;
- Updates and sharing of information; and
- To address and resolve Project-related concerns.

Project-related documents and materials used during consultation are listed in Aboriginal Consultation Report 1.

Aboriginal Consultation Plan – Kwantlen review and comment

From the beginning of consultation, the Ministry worked with Kwantlen to develop a mutually acceptable consultation approach, including the manner in which Kwantlen was to be kept informed about the Project, and the means by which comments (e.g., on the Project, its potential effects and the mitigation measures that may be used to avoid or minimize those effects) were to be communicated and addressed by the Ministry.

The Ministry's Draft Aboriginal Consultation Plan was informed by regulatory and legal requirements, the importance of enhancing or maintaining a positive, respectful and productive working relationship with Kwantlen, an established working relationship with Kwantlen, and specific input received during initial GMT consultation meetings with Kwantlen. The Draft Consultation Plan listed consultation activities, agreed to by both parties, and specified under the Kwantlen/GMT capacity funding agreement.

The Ministry undertook the activities below in order to obtain and, where appropriate, incorporate, input on the Draft Aboriginal Consultation Plan:

- Email request for review and comment with the Draft Consultation Plan provided as an attachment.
- Follow up communications (email and phone calls) to schedule a meeting to discuss the Draft Consultation Plan.
 - Discuss or obtain clarification on any comments provided by Kwantlen to the Ministry.
- Revision of Draft Consultation Plan
- Sharing of Revised Consultation Plan and a summary of responses to Kwantlen's

comments/input.

- Revised Consultation Plan and, for ease of reference, original Draft Consultation Plan provided via email
- Summary of comments/input provided by Kwantlen and corresponding action taken by the Ministry (i.e. revision to plan, comment “noted”, request for further discussion regarding request)

In consideration of the confidential nature of comments provided on the draft Consultation Plan and that specific consultation activities were planned for each Aboriginal group, the Ministry responded directly to each group regarding their respective comments on the Consultation Plan. Where Aboriginal Groups comments or requests did not result in changes to the Plan, a response was provided, along with an offer to meet to discuss any outstanding concerns or questions. Based on feedback received to date and discussions with Kwantlen on this matter, the Ministry is of the understanding that Kwantlen has no outstanding concerns or comments with respect to the Plan.

Kwantlen provided comments on the Draft Consultation Plan in a letter/email of October 26, 2015 and the Ministry met with Kwantlen (February 29, 2016) to discuss how these comments had been considered in revising the Plan. The Consultation Plan was revised, based on input received from Kwantlen First Nation and other Aboriginal Groups, and approved by EAO on April 6, 2016.

Capacity Funding

During Initial Consultation meetings, Kwantlen identified the need for capacity funding to support Kwantlen’s involvement in Project consultation activities, review of EA-related documents and participation in the pre-Application phase of the EA process. Kwantlen also identified the need for funding for a Kwantlen First Nation Traditional Use Study. The Ministry and Kwantlen worked together to finalize a funding agreement. The agreement specifies the activities covered under the agreement and Project/EA-related documents for Kwantlen’s review and comment. Kwantlen submitted a Study entitled Kwantlen Land Use and Occupation in the Vicinity of Highway 99.

Involvement in Archaeological Component of the Project

From the outset of discussions, Kwantlen identified the importance of the archaeological component of the Project and of their involvement in fieldwork and review of draft archaeological documents. All draft archaeological documents were shared with Kwantlen for review and comment. The Ministry and its archaeologist met with Kwantlen to present on this aspect of the Project. Kwantlen has participated in all archaeological fieldwork for the Project.

Pre-Application Consultation

The following section outlines consultation activities that the Ministry has undertaken with Kwantlen during the pre-Application Phase. The approach was developed with input from Kwantlen during the Initial Consultation Phase described above, and is outlined in the Consultation Plan. It is also informed by EAO's Section 11 Order, specifically Part G section 13 and 14, which outlines consultation requirements for the Ministry.

During consultation with Kwantlen in the pre-Application phase the Ministry has:

- Provided capacity funding to support continued involvement in Project consultation activities and the regulatory process;
- Provided all relevant Project-related information in a timely and effective manner that supports an understanding of the nature of the Project and its potential adverse effects on Kwantlen's Aboriginal Interests;
- Identified and provided, where possible, opportunities for Kwantlen to participate in fieldwork (River otter study);
- Identified and documented questions, issues and interests raised by Kwantlen;
- Continued to work with Kwantlen to identify potentially affected Aboriginal Interests;
- Identified measures to avoid, mitigate, or where required accommodate, potential adverse effects on Aboriginal Interests as appropriate; and
- Supported EAO-led Technical Working Group.

Funding for Application Review

The Ministry will work with Kwantlen with respect to the provision of capacity funding for the Application Review Phase, with the aim of providing reasonable capacity support for participation in the review of the EA and any related permitting processes. Funding is intended to facilitate participation in technical reviews and analyses, for involvement in ongoing consultation activities (as specified in the Consultation Plan), and to support Kwantlen in presenting information regarding their respective Aboriginal Interests. Funding is also provided to ensure the consultation requirements pursuant to the Section 11 Order are met and the Consultation Plan is implemented as intended. The Ministry will work with Kwantlen in an effort to finalize a funding agreement for the Application Review phase.

Consultation on EA-related documents

During this phase, the Ministry consulted Kwantlen on the following Project-related documents:

- Draft Project Description and Key Areas of Study(Project Description);
- Draft Application Information Requirements;
- Content of draft Part C of the Environmental Assessment Application Draft Consultation Report 1

Draft Consultation Report 2 was also provided to Kwantlen for review and comment. Where appropriate, input received from Kwantlen and other Aboriginal Groups will be incorporated into the revised Report.

Consultation on Aboriginal Consultation Report 1

The Ministry provided draft Consultation Report 1 to Kwantlen for review and comment prior to finalization and submission to EAO indicating that feedback received by May 2, 2106, would be incorporated into the final version as appropriate. Kwantlen provided feedback on Draft Consultation Report 1. Where appropriate, revisions were made to the draft based on Kwantlen’s input.

Participation in fieldwork

In April 2016, Kwantlen participated in river otter-related fieldwork. The objectives of this work were to document river otter relative abundance within the Regional Assessment Area, document and describe use of riparian areas, identify high use areas, and potential areas and options for mitigation.

Materials shared with Kwantlen during the pre-Application Phase are outlined below:

| Document | Description |
|---|---|
| Project Description and Key Areas of Study (Project Description) | Document prepared according to guidance provided in EAO’s <i>Guidelines for Preparing a Project Description for an Environmental Assessment in British Columbia</i> (EAO 2013). |
| Draft Application Information Requirements | The Working Group review of the draft Application Information Requirements (dAIR) commenced on January 6, 2016 . The dAIR outlines the studies, methods and information required for the Application for an Environmental Assessment Certificate. |
| Draft Application Information Requirements Presentation (December 2015) | Discussion of how comments received on first draft Application Information Requirements document were integrated into the next revised version. |
| Application Information Requirements | Final version of the document was issued on May 24, 2016. |
| Aboriginal Consultation Plan (April 2016) | Final version of Aboriginal Consultation Plan that |

| Document | Description |
|----------------------------------|--|
| | incorporated input received from Aboriginal Groups and EAO. |
| Draft Part C content | Draft components of Part C for review and comment by Schedule B Aboriginal groups: baseline summaries and mapping. |
| Aboriginal Consultation Report 1 | Draft summary of general consultation undertaken to date on the Project. For review and comment. |
| Aboriginal Consultation Report 2 | Draft report with Aboriginal Group-specific information on consultation undertaken to date on the Project. For review and comment. |

Meetings with Kwantlen First Nation

During the pre-Application Phase, the Ministry met three times with Kwantlen (see list of meetings for details). Kwantlen has participated in two EAO-led Working Group meetings. The EAO-led Working Group meetings focused on the following:

- Working Group Meeting (January 21, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - Project overview and update
 - Key Areas of Study
 - dAIR Overview
 - Preliminary conclusions from study results to date
- Working Group Meeting (March 10, 2016): *A one-day workshop with all members of working group. Discussions and presentations focused on:*
 - EA Process
 - List of materials available on Project website
 - Review of comments received on dAIR and resulting changes to the dAIR
 - Description and rationale of assessment areas

Communications Methods

During the pre-Application Phase, email communication was used for the following purposes:

- Coordination of meetings and other consultation activities with Kwantlen

representatives

- Follow up to meetings or earlier communications
- Provision of Project-related documents, updates and sharing of information
- Response to concerns or questions in relation to the Project
- Clarification of information and feedback shared by Kwantlen
- To address and resolve Project-related concerns

The Ministry used phone communications for the following purposes:

- Coordination of meetings and other consultation activities with Kwantlen
- Confirmation of information and follow up to previous communications
- Updates and sharing of information
- To address and resolve Project-related concerns

Documents for review were shared via email, in letter format and via mail/courier. These documents include:

- Letter requesting review of Draft Part C content
- Letter requesting review of Draft Aboriginal Consultation Report 1
- Letter requesting review of Draft Aboriginal Consultation Report 2

Kwantlen reviewed and provided comments on draft Part C content. Where appropriate, revisions were made to the draft based on the input received.
